GOSSEN, HERMANN HEINRICH (1810-58), German economist. Gossen was born at Düren near Aachen and spent most of his life in or near Cologne. Although he had shown a strong inclination to mathematics he was compelled by his father to study law and subsequently to enter government service. While at the university he became interested in economic problems and seems to have been strongly influenced by the writings of Bentham. After the death of his father in 1847 he devoted himself almost entirely to economic studies. His only work, *Entwicklung der Gesetze des menschlichen Verkehrs und der daraus fließenden Regeln für menschliches Handeln* (Braunschweig 1854; 2nd ed. Berlin 1889), with which he hoped to obtain the fame of a Copernicus, was hardly noticed at the time; the disappointed author ordered shortly before his death that the entire edition be destroyed. The book was discovered by Professor R. Adamson of Manchester and the discovery was made public by Jevons in the preface to the second edition of his *Theory of Political Economy* (London 1879), in which he frankly admitted that Gossen had "completely anticipated him as regards the general principles and method of economics."

Gossen's most important contribution is a clear formulation of what later came to be called the principle of marginal utility and its application to problems of value and price. His main theses have become known as the three laws of Gossen. First, the amount of satisfaction derived from consumption decreases with each additional unit of the same commodity until it reaches zero or the point of satiety. Second, if it is impossible to gratify all wants to the point of satiety, it is necessary in order to obtain maximum satisfaction to discontinue the satisfaction of different wants at the points at which their intensity has become equal. The third law is derived from the first two. Subjective value attaches only to goods the available quantity of which is smaller than the quantity wanted, and even for such goods the subjective value of additional units declines until it reaches the zero point. Also men should distribute their efforts

so as to make the value of the quantity of each good produced by a unit of effort equal to the pain of the last unit of effort expended. In his work Gossen used many simple algebraic formulae and two-dimensional diagrams.

FRIEDRICH A. HAYEK

Consult: Hayek, F. A., Introduction to 3rd ed. of Gossen's *Entwicklung* (Berlin 1927), with complete bibliography of all the earlier writings on Gossen; Liefmann, R., "Neuere Literatur über H. H. Gossen" in *Zeitschrift für die gesamte Staatswissenschaft*, vol. lxxxiii (1927) 500-17; Neubauer, J., "Die gossenschen Gesetze" in *Zeitschrift für Nationalökonomie*, vol. ii (1930-31) 733-53; Rosenstein-Rodan, P. N., "Grenznutzen" in *Handwörterbuch der Staatswissenschaften*, vol. iv (4th ed. Jena 1927) p. 1190-1223.

GOTHEIN, EBERHARD (1853-1923), German historian and economist. Although all his life Gothein was conscious that he possessed a historical rather than a theoretical mind, his antipathy to the political idea of history then reigning in the universities and schools and his preoccupation with *Kulturgeschichte*, a conception which along with his contemporary Lamprecht he did much to define and elaborate, led him in his youth to renounce history as an academic career. His *Kulturentwicklung Südtaliens in Einzeldarstellungen* (Breslau 1886; republished as vol. i of *Schriften zur Kulturgeschichte der Renaissance, Reformation und Gegenreformation*, 2 vols., Munich 1924) won the approval of Jacob Burckhardt; and his various writings on the Jesuits, particularly *Ignatius Loyola und die Gegenreformation* (Halle 1895), are still valuable. As early as 1884 he had, however, accepted the professorship of political economy in the superior technical school at Karlsruhe. There upon the request of the newly founded Historical Commission of Baden he wrote *Wirtschaftsgeschichte des Schwarzwaldes* (Strasbourg 1892), which treats the development of towns and industries in the Black Forest and represents Gothein's chief specific contribution to the social sciences. In 1890 he succeeded Erwin Nasse at Bonn, where he was brought into intimate contact with the commercial and industrial life of Rhine Province

and Westphalia. In response to this stimulus he not only introduced into his classes original methods of field study but entered upon new researches, culminating in a series of works on such subjects as shipping, mining, the economics of electricity and the history of Cologne. He also participated in the movement to establish superior schools of commerce outside the universities and in 1901 founded the superior school of commerce (now the university) of Cologne and seven years later that of Mannheim. Inspired by the example of Max Weber, whom he succeeded at Heidelberg in 1905, he ventured into the field of systematic sociology and in a not unimportant study, "Die Reservearmee des Kapitals" (in *Heidelberger Akademie der Wissenschaften, Philosophisch-historische Klasse, Sitzungsberichte*, vol. vii, 1913), he sought to broaden the socialist concept of the labor reserve army. Gothein's interests and achievements were far too extensive and at times perhaps too superficial to leave a lasting impression on any specific aspect of the social sciences. His principal importance probably lay in his awareness of the need for that coordination with actual economic and especially industrial life which a large proportion of the pre-war German economic schools, whether historical or theoretical, had conspicuously failed to achieve.

CARL BRINKMANN

Consult: Gothein, Marie L., *Eberhard Gothein* (Stuttgart 1931); Brinkmann, C., in *Zeitschrift für die Geschichte des Oberrheins*, n.s., vol. lxxix (1926) 313-29; Hampe, K., "Eberhard Gothein, eine Gedächtnisrede" in *Historische Zeitschrift*, vol. cxxix (1924) 476-90; Gooch, G. P., *History and Historians in the Nineteenth Century* (London 1920) p. 586-88.

GOTO, SHIMPEI (1857-1929), Japanese statesman and social scientist. Goto was born of a samurai family and studied medicine at the Fukuoka Medical School and later at the University of Berlin. During his whole career his activities were motivated by his desire to apply scientific principles to problems of government and administration. As acting director of the Sanitary Bureau in the Department of Home Affairs, as president of the Central Sanitary Association and as director of the Sanitary Bureau he was active in the improvement of medical science, particularly along the lines of social sanitation. In 1897 he was appointed chief of the Civil Administration Bureau of Formosa and served as civil governor until 1905. His administration was marked by the construction of roads

and railroads, the encouragement of industry, the enforcement of the opium and camphor monopoly law and the foundation and development of various research bureaus, including the great Central Bureau of Research. As first president of the South Manchuria Railway from 1905 until 1908 he again applied scientific methods to the problems of colonial administration by means of the Far Eastern Bureau for Economic Research at Dairen and other bureaus for special problems. Local industries, the water supply, hospitals and public health agencies were established on a non-political, scientific foundation. From 1908 to 1912 Goto served as minister of communications; in that capacity he initiated research in the subject of hydro-electric power and instituted a Railway Investigating Bureau which conducted research into such problems as coal, railway construction and terminals and the relations of railways to industries.

In 1918 Goto visited the United States and was greatly impressed by the work of the New York Bureau of Municipal Research. He endeavored to have a similar bureau on a national scale established in Japan but failed because of lack of funds. In 1922 as mayor of Tokyo he was able by means of privately contributed funds to establish the Institute for Municipal Research, the unique worth of which became evident in the scientific plan for the reconstruction of Tokyo after the earthquake and fire of 1923.

Goto was an early advocate of rapprochement between Japan and Russia. He entered into informal negotiations with a Soviet representative in 1923 and in December, 1927, headed a mission to Moscow to study economic conditions preparatory to the negotiation of an economic treaty.

HARLEY FARNSWORTH MACNAIR

Consult: Beard, Charles A., "Japan's Statesman of Research" in *American Review of Reviews*, vol. lxvii (1923) 296-98; Kawakami, K. K., "Japan as a Colonizing Nation" in *World To-Day*, vol. xii (1907) 483-87.

GOTT, BENJAMIN (1762-1840), English merchant and pioneer factory owner. In 1792 Gott, who was senior partner of a large cloth merchant house in Leeds, conceived the idea of gathering into one factory the twenty-nine processes involved in turning a bale of wool into finished cloth. At the time the three main groups of textile processes were carried on separately. Yarn making, because of the introduction of scribbling and carding machines, was carried

on in mills, but weaving and spinning were still being conducted by domestic clothiers under the putting out system. Finishing was carried on in separate shops and dyehouses which worked for or belonged to the merchants, who bought their supplies in the rough, dressed the fabrics and sold them. Gott experimented with new methods in manufacturing and finishing, which he greatly improved, studied costs, which he lowered through better supervision and more division of labor, and attempted the use of steam and steam power for nearly all processes. He bought a 40 h.p. engine from Boulton and Watt to drive the woolworking machines, the fulling stocks and the stones which ground the dye-woods. But power driven machinery did not capture spinning and finishing until after 1820 and the power loom made little headway until 1850, so that the jennies were turned by hand and weaving was done on hand looms. Gott still depended on domestic clothiers for many of his supplies and regarded his manufacturing as less important than his finishing and mercantile activities, which included the dressing and blanketing of most of the great armies of Britain and her allies. Gott's main achievement therefore in the acceleration of the industrial revolution was in the collection of over a thousand employees in a factory—even though it still relied largely on manual labor—in increased economies in production and in the capture of new markets for English textiles.

HERBERT HEATON

Consult: Heaton, H., "Benjamin Gott and the Industrial Revolution in Yorkshire" in *Economic History Review*, vol. iii (1931) 45-66, and "Benjamin Gott and the Anglo-American Cloth Trade" in *Journal of Economic and Business History*, vol. ii (1929-30) 146-62; Crump, W. B., *The Leeds Woolen Industry, 1780-1820* (Leeds 1931).

GOUGES, OLYMPE DE (Marie Gouze) (1748-93), French feminist. She wrote several plays, one of which *L'esclavage des noirs ou l'heureux naufrage*, produced at the Comédie Française in 1789, pleaded for the liberation of slaves. With the revolution she entered the political struggle and wrote on numerous social questions. She believed that women should take part in national reorganization and first put forward the idea, adopted in August, 1789, of a patriotic voluntary subscription to wipe out the deficit.

She was especially important as the theorist who initiated the French political and practical feminist movement of the nineteenth century. In two short but substantial works, *Droits de la*

femme (Paris 1791?) and *Le bonheur primitif de l'homme* (Paris 1789), she expounded the doctrine of integral feminism along original lines. Taking the Declaration of the Rights of Man as a basis she demonstrated as a logical conclusion the absolute equality of both sexes. She argued that "women are born free and equal to men in law," that "the nation is an assembly of men and women," that "law as the expression of the will of the majority is as much the expression of female as of male citizens," and demanded that women send representatives to political bodies, be eligible to offices of public administration and to all other positions, tasks, occupations and responsibilities open to men and enjoy equality in the family and independence in marriage. She envisaged temporary marriages and official inquiry into the paternity of children born of such unions. Having espoused the cause of constitutional monarchy she was guillotined in 1793.

LÉON ABENSOUR

Consult: Abensour, L., *La femme et le féminisme avant la révolution* (Paris 1923) p. 449-55; Lacour, Léopold, *Les origines du féminisme contemporain. Trois femmes de la révolution* (Olympe de Gouges, Théroigne de Méricourt, Rose Lacombe) (Paris 1900).

GOULD, JAY (1836-92), American financier. Gould became a Wall Street broker in 1859; ten years later he was in control of the Erie Railroad in association with Daniel Drew and James Fisk, Jr. He enriched himself by completing the financial ruin of the Erie, fraudulently manipulating its stock and finances—an exploit facilitated by prevailing business morality and loose corporation laws. In 1869 Gould and Fisk engineered a corner in gold, involving a number of public men in their scheme; the corner resulted in the disastrous "Black Friday" panic. The ensuing scandal was used in an attempt to force Gould out of the Erie; but all efforts to break his control were unsuccessful, because of his corrupt influence with judges and legislators and his alliance with William M. Tweed of Tammany Hall, until a group of English stockholders in 1872 bribed Erie directors whom Gould intended to replace to oust him from the presidency. He was sued by the new management for restitution of \$12,803,000 and settled for the sum of \$6,000,000, most of it being in worthless securities.

After the Erie ouster Gould interested himself in the western railroads, which were being exploited by predatory groups of the kind revealed by the Crédit Mobilier investigation. There

Gould outdid men of his own type in trickery. He bought considerable stock in the Union Pacific Railroad, of which he became a director; a few years later in 1878 he profitably unloaded some bankrupt railroads upon the Union Pacific. Gould extended his operations, first depressing stock values and then buying heavily, and acquired control of 10,000 miles of railroads in the southwestern states. He now interested himself in stabilizing values, as speculative mismanagement and rate wars were threatening the western railroads with perpetual bankruptcy. In 1889-90 he attended a series of conferences called by bankers to form an organization to lessen competition and maintain rates. Gould proposed a drastic five-year agreement for centralized control of rates, but the conferees adopted more moderate "gentlemen's agreements," which were violated under pressure of competition.

Gould was implacably opposed to union labor, an attitude he shared with the captains of industry and finance of his generation. In 1883 he broke the telegraphers' strike in the Western Union Telegraph Company, of which he had secured control by his usual manipulative methods, and forced the men to sign an agreement abandoning "any and all [union] membership, connection or affiliation." Two years later the Knights of Labor won a strike on Gould's southwestern railroad system. But the management violated the agreement and another strike occurred in 1886; Gould disregarded a pledge to arbitrate, crushed the strike and boasted that he had broken the back of the Knights of Labor.

The activities of Gould aroused public indignation, government investigations and reform legislation. Critics concentrated their attacks upon him, but in point of fact Jay Gould was the product of an unusually corrupt and predatory age; his operations were characteristic of the speculative exploitation which accompanied the industrialization of the United States after the Civil War. He left a fortune amounting to \$72,000,000. By 1900 the Gould system included 16,000 miles of railroads, of which the family later lost control.

LEWIS COREY

Consult: Adams, C. F. and Henry, *Chapters of Erie* (Boston 1871); White, Trumbull, *The Wizard of Wall Street and His Wealth* (Chicago 1892); Myers, Gustavus, *History of the Great American Fortunes*, 3 vols. (Chicago 1907-09) vol. ii, chs. ix-xii, vol. iii, chs. iii-iv; Corey, Lewis, *The House of Morgan* (New York 1930); Ware, N. J., *The Labor Movement in the United States, 1860-1895* (New York 1929).

GOURLAY, ROBERT FLEMING (1778-1863), British author and agitator. Gourlay, a Scotsman of good birth and education who had interested himself in scientific agriculture and in poor law reform, came to Upper Canada in 1817. Desiring to start an organized emigration movement, he proceeded to collect information, published an address, *To the Resident Landowners of Upper Canada*, containing a lengthy questionnaire and traveled about the country addressing public meetings. His activities aroused the ill will of the "Family Compact," the aristocratic governing authorities, who feared it might increase the already existing discontent, and Gourlay was soon transformed from the investigator to the political agitator. Finally in 1819 he was arrested and sentenced to banishment. His trial and punishment were technically according to law, but the severity and vindictiveness of the authorities aroused widespread resentment. Gourlay, a sick man who lacked mental equilibrium as well, spent the rest of his life moving restlessly about in Great Britain and the United States and eventually also in Canada, pouring forth a stream of pamphlets and agitating for the redress of his grievances, which was finally granted by the legislature of Canada. By making his own personal grievances loom larger than the public cause he was supporting he spoiled the effect of his efforts. But his most important work, the *Statistical Account of Upper Canada Compiled with a View to a Grand System of Emigration* (2 vols. and additional introductory volume, London 1822), anticipated the views on emigration of Gibbon Wakefield. His agitation in Upper Canada marks the beginning after the War of 1812 of the democratic reform movement which finally led to responsible government and which forms the Canadian counterpart to the movement of Jacksonian Democracy in the United States.

GOURNAY, JACQUES CLAUDE MARIE VINCENT DE (1712-59), French economist. Gournay was a merchant engaging in business at

Cádiz from 1729 until 1744 and later traveling extensively in England, Holland and Germany. In 1746 he inherited from his partner the estate of Gournay (whence the name by which he is known) and in 1751 bought the office of intendant of commerce, which he held until the year before his death. Except for his official reports, pronouncements and correspondence his writings include only a few annotated translations such as that of Josiah Child's *A New Discourse of Trade*. But besides playing a most prominent part in the introduction of English economic literature into France he popularized the reading of Cantillon, had more or less influence upon the publications of Dangeul, Forbonnais, Herbert, Clicquot-Blervache and Morellet and was one of the first to awaken Turgot's interest in economics. Although he founded no school he became the center of a group which devoted itself to the dissemination of new economic ideas throughout the kingdom. This group helped to pave the way for the physiocrats, of whom they were the immediate precursors. Gournay's doctrine was far from being a coordinated system in the sense of Quesnay's; it was the doctrine of a practical liberal hostile to bureaucracy, of an administrator struggling against the tyrannical system of industrial regulation inaugurated by Colbert or against the corporate privileges and grain policy which had been bequeathed by the Middle Ages. According to the testimony of his collaborators his favorite maxim was *laissez faire, laissez passer*, which may be freely translated as "give free rein to production, give free rein to the circulation of goods produced." Gournay differed from the physiocrats in that he was solicitous for the welfare of all "sources of wealth" alike. Thus while Quesnay in posing the dominance of agriculture was to dub industry and commerce "sterile," Gournay, whose training and office might easily have dulled his interest in everything but industry and commerce, took an active part in the eighteenth century agricultural movement; in 1757 he was responsible for the establishment at Rennes of one of the first of the French societies for the propagation of scientific agricultural methods. A further difference between Gournay and the physiocrats was that, although the curtailment of commercial restrictions was essential in his doctrine and almost incidental in theirs, he was not an absolute free trader. As regards internal exchange he demanded unlimited freedom; but in external trade he admitted a system of enlightened protection, not prohibitive but suf-

ficiently high to defend domestic enterprise against foreign competition and even to assist it somewhat in expanding abroad. He also favored the granting of state subsidies to develop all branches of economic endeavor.

GOUVÊA, ANTÔNIO DE (1505-66), Portuguese humanist and jurist. Gouvêa pursued his humanistic studies at the Collège de Sainte-Barbe in Paris from 1527 until 1532. After lecturing at Sainte-Barbe and at the Collège de Guyenne he studied Roman law at Toulouse, Avignon and Lyons according to the new methods which were introduced into jurisprudence by his friend Cujas. He gained wide renown through his famous debate with Pierre La Ramée (Petrus Ramus) in 1544, in which his defense of Aristotle and Aristotelianism, undertaken by him as a humanist, not as a scholastic, was awarded the victory by the University of Paris and King Francis I.

Gouvêa ranks next to Cujas as a jurist who expressed with great clarity the fundamental program of the humanist jurists of the sixteenth century: the abandonment of the exclusive use of the Commentaries, which by that time had acquired a prestige greater than the sources themselves; and the reconstruction of the entire body of the Roman law, tracing its evolution in relation to the historical development of the Roman Empire. The law was to be studied through an examination of the sources aided by the Commentaries. Gouvêa so excelled in the application of the humanist method that he was generally considered the rival of Cujas himself.

HISTORY AND THEORY. All human societies seem to possess an inherent capacity to develop systems of social control whereby the relations of individuals are adjusted and common interests and desires secured. Such systems are of two general kinds, those which operate spontaneously and automatically, springing directly from the common sense of right of the community and enforced by sanctions of social pressure, and those which have acquired a definite institutional organization and operate by means of legal mandates enforced by definite penalties. This latter form of social control is government, using the term in its broadest sense. The distinction between the two forms is not an absolutely sharp one, and there is often a considerable intermingling. The amorphous type of social control predominates among primitive peoples; government if it exists at all is rudimentary. As civilization advances, increasingly complex institutional organizations develop, definite legal systems are formed and enforcement

is accomplished through prescribed pains and penalties. But even in the modern national state, where government has proceeded to the highest point of organization, there is still a vast body of social relations which are adjusted outside the scope of governmental activities, as there are also a great number of common interests and desires secured by the automatic and spontaneous action of society in its unorganized aspect. Indeed, to be effective, government must utilize in large measure these formless social pressures. It must work in harmony with the prevailing sense of right of the community. It must not seriously traverse the common interests and desires.

Wherever a group of human beings actuated by common interests and desires creates an organized institutional mechanism for the furtherance of these ends and for the adjustment and control of their relationships, there is government. There is a government of the church, of the trade union, of the industrial corporation, of

the university. And the definite norms of conduct which are prescribed and enforced by such governments may properly be characterized as law. In a narrower sense the term government is confined to the organized institutions of political communities which are designated by the term state; and the term law is restricted to those rules of conduct which adjust and control the relations of individual members of the state and through which their common interests and desires are secured. This narrower usage is indeed somewhat arbitrary, for political government is essentially like other forms of government. Only in one respect is it perhaps different. The state is a community in which membership is not voluntary but imposed upon all individuals within a given territory. This was also true of the church in the Middle Ages. But among modern communities the state is the only one from which an individual may not withdraw without leaving the territory occupied by the community.

The juristic theory of the state conceives government as performing legislative, executive and judicial functions. It is assumed that any act of government can by its nature be classed under one of these functions. However well established and however practically useful in the past, this classification can be challenged both theoretically and practically in the light of new conceptions of the ends and purposes of government. Government is coming increasingly to be looked upon as a collection of public services, as one of the important instruments through which the common interests of the members of the community are to be furthered. The state provides for its members a large number of services, such as education, scientific research, public utilities, recreation, which cannot properly be described as legislative, administrative or judicial. The functions of government are social control and public service.

Every system of government, even the most primitive, rests upon a constitution, by which is meant a system of legal principles which designate the highest governmental authorities, the method of their choice or creation, their mutual relations, the sphere of activity of each and the position of the individual with reference to them. Frequently the constitution is conceived as divinely instituted and unalterable. It is often surrounded by special sanctions. The Greeks were perhaps the first to speculate about the nature of political authority and the best form of government. They distinguished between

fundamental law, *politeia*, and ordinary laws, *nomoi*. The Romans also distinguished between constitutional and ordinary law and between the authorities which could enact each. The ancients, however, never went so far as to embody their constitutional law in fundamental statutes with a higher formal validity than ordinary laws. The distinction was one of substance not of form.

The modern conception of a constitution is the product of a number of ideas and usages of the later Middle Ages. First, there was the generally accepted belief in natural law, unchanging and universally binding and standing above all human law. There was at least an indefinite assumption that natural law should control legislation and other forms of positive law. Second, important mediaeval legislation (described by such terms as constitution, statute, assize, *établissement*) combined the idea of something formally laid down, enacted, established, with the idea of a binding agreement or contract, strict adherence to which was a principle of natural justice. Third, there was the conception of a general law of the land (*jus et consuetudo regni*) which secured to all members of the community certain rights. The common law of England, guaranteeing to all Englishmen certain substantial rights, is perhaps the best example. Fourth, the numerous charters which granted certain privileges and immunities to corporations, boroughs, towns or ecclesiastical groups, while in the form of grants, embodied the ideas which underlay important legislative enactments. These various ideas, somewhat vague and indefinite, gradually issued in the conception of a body of fundamental law to which even the highest authorities were subject. In the sixteenth century the antimonarchical writers developed the doctrine of fundamental law. Even adherents of the theory of the divine right of kings, such as James I in England in the seventeenth century, acknowledge that the royal power was limited by basic principles which they conceived as emanating from God or embodied in natural law. The seventeenth century struggle between king and Parliament in England resulted in the definite emergence of the idea of a constitution in which was included, in addition to the various ideas discussed above, that of a social compact. Attempts to reduce such a fundamental law to written form are characteristic of the period. The Mayflower Compact, which served as the basis of the government of the colony of Plymouth, and the Fundamental Orders of Connecticut are among the earliest examples. The Agree-

ment of the People drawn up by the soldiers in Cromwell's army represents an effort to give England a written constitution, and the Instrument of Government promulgated by Cromwell in 1653 was a written constitution actually in force for several years. The American states adopted written constitutions after their separation from Great Britain. Their example was followed by France in 1791 and then by the states of Germany and other European countries, by South American nations and finally by oriental peoples. More than three hundred written constitutions are said to have been established between 1800 and 1880. The period since 1776 can be characterized from the political point of view as the age of constitutionalism. In many instances written constitutions have been the result of successful popular revolutions which have been conducted with the purpose of achieving democratic government. In other cases they have been granted, or octroyed, by monarchs to prevent threatened revolutions. Constitutions which are the product of revolution embody the theory of popular sovereignty; all governmental power is assumed to be derived from the people. Octroyed constitutions are in theory voluntary concessions of absolute rulers, who thereby surrender only a part of their unlimited authority.

Governments have been classified according to various principles. One of the oldest classifications is based upon the number of persons who exercise the highest power in the state. Monarchy is the government of one, aristocracy of a small number, democracy of the many. The Greeks added three perverted forms to these three normal types—tyranny as the degeneration of monarchy; oligarchy, of aristocracy; and ochlocracy, or mob rule, of democracy. Some writers believed that government went through a cycle of these six forms. Under this classification, however, the English government is classed as a monarchy and that of the United States as a democracy, although the president of the United States exercises quite as much power as the king of England and the democratic element in the English constitution is quite as important as it is in the United States. Another classification of governments is into monarchies and republics, the chief magistrate being hereditary in the former, elective in the latter. But the old Polish monarchy was elective, and the Republic of the Netherlands had a hereditary head, the *Staatshoofd*.

More significant in the study of modern political institutions is the classification into cabinet

government and congressional government. In the former the principle of separation of powers is not applied, and a cabinet or ministry responsible to the popularly elected legislative body occupies a supreme position in directing legislation as well as in administration. In congressional government the attempt is made to separate government sharply into legislative, executive and judicial branches politically independent of one another. But this classification too is not capable of a thoroughly logical application. There is in the English government, the archetype of the cabinet form, a large degree of actual separation of powers; while in the government of the United States, the best example of the congressional type, there is in actual operation a considerable amount of political interdependence among the various branches of government.

Another useful principle of classification is that which is based upon the nature of the relation between the central government and local divisions. Unitary government, in which the authorities are conceived as creatures of the central government and as exercising their legal powers by delegation from the central government, is under this classification opposed to federal government, in which the local divisions are conceived as having an independent legal existence. A federal state is one made up of member states. But this classification is based upon a narrowly juristic conception of law and a doctrine of sovereignty which do not conform to the actuality of modern political phenomena. In strict juristic theory the powers exercised by the governments of Canada, Australia and the other dominions are delegated by the British Parliament; hence the entire British Commonwealth of Nations is a unitary state. In fact, the dominions have a larger degree of political independence than the states in the United States.

The term constitutional government generally refers to modern forms in which a basic law or laws provide for an elaborate system of authorities, including representative assemblies, in which a large share of political power is vested in the electorate, which is considered as equivalent to the people, and in which a body of basic individual rights is guaranteed and protected by the fundamental law. In this sense it is to be contrasted with despotic or absolute government, where theoretically all political power is in the hands of one man and where the individual has no legally protected rights.

Modern constitutional government is the result of a long process of historical development

in western Europe. The particular attendant circumstances have varied in different countries but the general economic and social conditions throughout this area have been sufficiently similar to produce an approximately common line of progress. The history of England illustrates better than that of any other country the course of political evolution. Geographical isolation and consequent freedom from invasion since the Norman Conquest have undoubtedly been an important factor in England not present upon the continent, and during the later period English political development has anticipated by a century or more that of continental countries.

Six stages are clearly discernible, although no sharp dividing lines can be marked. The first may be described as the tribal state, which in England covers the Saxon period. The significant political institutions of the primitive Teutonic tribes who overran western Europe were a folkmoet, or meeting of all the adult males bearing arms; a council of elders; and in time of war a war leader or chieftain. All important questions, such as peace and war, were decided by the folkmoet. The council of elders prepared questions to be submitted to the folkmoet and decided minor matters. It was a rude form of democracy in which government was not differentiated nor law clearly distinguished from religious or social custom. In time of war great power was vested in a single leader. Through war the numerous small and independent tribes were eventually integrated into larger political units; the war leader became a permanent king; folkmoets sank into governing bodies for local divisions; and a witenagemot, or council of wise men, emerged for the entire nation. At times the king overshadowed the witan. At times the council appears to have exercised almost supreme authority, and throughout it possessed a large power in choosing the king. The position of the king was never solidified. In time of war he was certainly dominant; in peace he was always limited by the law and custom of the land and by the witan, whose consent was necessary to the establishment of new laws. Local institutions flourished and supplied the needs of government quite independently of the still rudimentary central authority.

The second stage is the feudal state, extending in England roughly from the Norman Conquest in 1066 to Magna Carta in 1215. There were two sides to feudalism, economic and political. The political aspect involved certain military and political services from the vassal to the lord

and ultimately to the king. All these feudal rights were exercised by the king as the feudal lord of the entire realm and served to develop and strengthen his position in the state. The service of the vassal to his lord was viewed as a private obligation owed by one man to another; the relationship of the individual was in every respect contractual and unalterable except by mutual consent. Based on these feudal foundations, governmental institutions underwent important modifications. The witenagemot, now become the *magnum concilium*, was feudalized; attendance was made obligatory for all tenants in chief. A smaller council consisting of those who were always in attendance upon the king acted for the great council in most matters. From it developed many of the institutions of later constitutional government.

The later Middle Ages is the period of the estates state. This epoch is characterized by a clear cut stratification of society into several classes or estates and the representation of these estates in the government. The altered character of the great council particularly displays the nature of the development. It is now called Parliament in England; but it is entirely different from a modern parliament, which is representative of the people as a whole. It is rather an estates general, a body of separate estates or representatives of estates. The nobles, the clergy, the landed gentry and the townsmen constituted the four estates in the English Parliament. While at first meeting together, these several estates probably always acted separately. About the middle of the fourteenth century occurred the separation of the English Parliament into a House of Lords and a House of Commons. This did not, however, in any way affect the character of this mediaeval Parliament as an estates general. There is a fundamental pluralism in the estates state which is in sharp contrast to the conception of a unified sovereign state of later times. The relation between the king and the estates was contractual rather than constitutional. The numerous charters, of which Magna Carta is the most noteworthy in England (the Golden Bull of Andrew II, dating from 1222, has a corresponding place in Hungarian constitutional history), were not great charters of liberties for the people but treaties between the king and one or more of the estates. This was an age in which the various elements in society struggled among themselves for power. As yet the idea of a unified national state was at most only a hope for the future.

The absolutist state, which in England can be roughly marked by the accession of the Tudors in 1485 and the Revolution of 1688, was based upon the idea of sovereignty personified in the monarch. When absolute monarchy endures beyond its time it tends to degenerate into an intolerable system destructive of individual liberty and blighting to national progress. But the advantages of modern constitutional government are all based upon the permanent achievements of absolute monarchy. The various estates were fused and welded into a common nation. The rival and conflicting jurisdictions and authorities were subjected to the firm and effective control of one supreme power. The church with its immunities and nearly independent status was brought under the domination of the state. Foreign dependence was thrown off. This work was accomplished under the Tudors of England and in France and in Spain by the sixteenth century. The papacy in Italy and the empire in Germany prevented the achievement of national unity in those countries; instead there emerged a large number of small states of a generally monarchical type, which were only unified in the nineteenth century. In England the latter part of this period is filled with conflict between king and Parliament, but this conflict is totally unlike that between king and barons in the previous period. The nation had been unified, the principle of the sovereignty of the state had been established, and the question was now only as to whether the king or Parliament should exercise the supreme power.

The Revolution of 1688 introduced the period of the parliamentary state in England. In France this transition took place a century later. Elsewhere upon the continent it occurred at various dates throughout the nineteenth century. But the English Parliament was itself actually controlled by a narrow oligarchy until the passage of the Reform Act of 1832. The same oligarchical character is found in the parliamentary governments of the other states of Europe. A narrow and unequal suffrage, constituencies organized in such a manner as greatly to enhance the political power of the ruling class, an upper legislative chamber in which the people had no voice, all contributed to preserve the actual control in the hands of a small section of society. Even in the United States before the period of Andrew Jackson the suffrage was generally restricted and power was actually in the hands of a small element of the population. While oligarchical government like monarchical absolutism tends

to become corrupt, it too performed an important role in developing the intricate and complex machinery of constitutional government. This was the period in which the cabinet took shape and form and became the central feature in England. The party character of the cabinet; its political solidarity; the development of the prime ministership; the responsibility of the cabinet to the House of Commons; the determination of the sanctions of ministerial responsibility; the discovery of the counterweight in the prerogative of dissolution by which the cabinet can exercise a control over the Commons; the definite relegation of the king to his present dignified but powerless position; and the determination of the reciprocal rights and obligations obtaining between cabinet and king; all the important constituent elements of the cabinet system were worked out at this time. For a democracy to operate the mechanism of constitutional government successfully it must have attained a certain degree of political experience and knowledge. There must be an awakened and informed public opinion. There must also have developed those definite conventions and usages which preserve the equilibrium of the system and militate against any successful coup d'état. The methods and practises by which government is operated must have become largely a matter of tradition and have secured the sanction of well recognized principles. Only within a narrowly based political society could this complex mechanism be successfully set in motion. Once well established and in full operation, it was possible by degrees to broaden the oligarchical control into effective democratic government.

The democratic state is the last phase of political evolution extending down to the present. Certain basic ideas underlie this form of government: the sovereignty of the people; the identification of the people with the electorate; universal suffrage, with every man and woman to count as one and none to count as more than one; the right of the majority to rule. The broadening of the suffrage and the reform of the constituencies were not accomplished in England until 1832. By the successive reform acts of 1867, 1884 and 1918 the political basis of English government has been extended until it is now practically universal adult suffrage. The same process has taken place in other countries. Certain important changes have been introduced in electoral methods. Plural voting has generally disappeared; voting is now universally accomplished by written and secret ballot; corrupt

practises at elections have been largely eliminated; proportional representation has been introduced in certain areas; and the nomination of candidates has been regulated by law. The extension of the scope of electoral activity by the initiative and referendum and the limited use of the recall are further important features. Apart from these institutional changes which affect the electorate there has been little significant alteration in the general framework of constitutional government. The period has been rather marked by attention to the problems of social reform and the regulation of industry and by attempts to solve the question of international peace. With the democratization of government emphasis has shifted from the structure of political institutions and methods of procedure to the substantive tasks which society expects government to accomplish.

The question of the degree to which government should undertake to regulate the relations of men has been actively discussed since the middle of the eighteenth century. Before the French Revolution all the governments of Europe, but particularly France, undertook a most extensive and minute control of all the economic life of the people. Business, commerce and industry were subjected to an infinite number of regulations. The economic causes of the American Revolution are not to be viewed as examples of governmental oppression peculiar to the colonists. They were part of a general system. The French Revolution was not merely political in its cause and purpose; it was to a considerable extent likewise induced by the vast amount of state interference.

In reaction to this mercantilist policy political and economic thought from the French Revolution until the Franco-Prussian War deprecated the extension of the functions of government beyond the necessary minimum required to defend the state from external attack, to preserve internal order and to adjudicate individual rights. The primary purpose of government was to secure liberty, which was interpreted narrowly and negatively as freedom from restraint. John Stuart Mill's *Essay on Liberty* (1859) is perhaps the most perfect expression of this philosophy. It was the age of individualism, of *laissez faire*. Government in practise did not indeed adhere strictly to this ideal. Particularly as the impact of the industrial revolution came to be felt, an increasing degree of state interference is discovered in the statute books. The factory acts constitute the notable beginnings of a broader

policy. But any exceptions to the policy of confining governmental activities to the narrowest limits were viewed as perhaps necessary but unfortunate departures from the accepted principle that "that government is best which governs least."

As the effects of the industrial revolution, including the growth of capitalism, were realized, a strong socialistic movement spread throughout Europe. Dicey has admirably described how public sentiment gradually altered and how in consequence the history of legislation acquired a new character in England after 1870. Fabian socialism in England, Marxian socialism on the continent, exerted widespread influence. Governments, especially that of Germany, definitely undertook broad programs of human betterment. In America, although theoretical discussion of the province of government was not pursued to the same extent as in Europe, the volume of state and federal legislation greatly increased and numerous administrative commissions were created, charged with duties of inspection, regulation and control. No clear cut political theory emerged from this epoch of industrialism. Particularly in America continued expressions of attachment to the tenets of individualism and *laissez faire* have accompanied the actual enlargement of governmental powers and the expansion of governmental activities into hitherto unoccupied fields. Certainly socialistic doctrines, while playing a very significant role, were nowhere generally accepted as the determinants of political action previous to the World War. Governments have been led step by step into new undertakings. They have approached the increasing number of urgent economic and social problems pragmatically, often reluctantly. This opportunistic attitude of government is quite in keeping with the prevailing tone of popular and academic thought. The clash of individualistic and socialistic ideas has resulted merely in a rather confused and empirical doctrine of liberalism. No comprehensive or adequate theory of the ends and purposes of the state has emerged to inspire the course of practical politics. In one respect only is a new orientation discernible. The earlier conception of government as merely an agency of social control, an instrument of protection and regulation, is giving way to that of government as a collection of public services, a means for the satisfaction of human wants and desires.

The nineteenth century was characterized by a profound faith in the principles of democracy.

"Government of the people, by the people, and for the people" constituted an ideal which made an almost religious appeal to the minds and hearts of men. Criticism of the working of existing democratic institutions was blandly met by the insistence that "the cure for the evils of democracy is more democracy." Writers like Lecky and Maine who formulated effective arraignments of democratic government were voices crying in the wilderness. The sweep of democratic opinion was probably the most significant aspect of the history of this period. But since the beginning of the twentieth century and particularly since the World War certain opposing political tendencies have been increasingly evident. In spite of systems of universal and equal suffrage, of representative legislative bodies, even of the initiative and referendum, it has become more and more evident that effective power is concentrated in the hands of relatively small but wealthy groups. The alliance between government and big business; the significance of the boss who performs the very profitable role of political broker; the part played by the political machine; the extensive use of money in elections; the power and methods of propaganda; the place the lobby occupies in the actual work of government, have come to be better understood. Democratic government operates through the instrumentality of political parties. At times these organizations have offered valid alternative programs to the electorate but generally their principles have been vague and cloudy; their appeal has been made to the emotions and prejudices rather than to the intelligence of the voters. A sense of the fatuousness of political action has spread throughout the mass of the people. The particular circumstances in different countries have varied, but everywhere there has been an increasing feeling of political skepticism. President Wilson proclaimed the purpose of the Allies in the World War to "make the world safe for democracy." But the Treaty of Versailles only intensified the political disillusionment. It is true that the war resulted in the overthrow of several ancient thrones and the establishment of republics. But the succeeding decade has witnessed the arrival of a number of dictatorships, that of Mussolini in Italy the most important. And even in countries like Germany, where government has been thoroughly democratized, there is an absence of assurance, a lack of faith, a sense of insecurity. If the "degradation of the democratic dogma" is evident, what are the alternatives?

Communism is one possible alternative, and the experiment in Russia is being observed with great interest. But even if the experiment should succeed, it is becoming clear that the ends and purposes which it seeks to achieve, the schemes of values which it embodies, are not acceptable to the peoples of the western world. Western civilization rests upon a social heritage which Russia has not enjoyed and which provides a different attitude toward life. Only as a result of a social upheaval which would shatter the foundations of the western system of ideas would the establishment of communism be possible. Such an event is within the range of possibility, but it is not probable.

If the transition to a new political order is to be accomplished by processes of political evolution rather than social revolution, the present democratic state must undergo such changes and adaptations as are necessary to meet the changing situation and to correct the defects which are becoming increasingly evident. First, the state must come to be viewed as only one of many human societies, which exists for the accomplishment of limited ends and purposes. Its attribute of sovereignty must be abandoned; with respect to both international and internal relations it must be recognized that other human associations have equally significant purposes and are equally entitled to respect. Second, the old antithesis between the state and the individual must give way to a recognition of the innumerable intermediate human groups which are organized for economic, social, religious, recreational, artistic and other purposes. Third, some means of inclusion in the framework of government must be found for these multifarious groups. The outworn geographical basis of the representative system must be modified to provide for the representation of interests, particularly economic interests. Fourth, the purposes of government must be interpreted more in terms of providing public services for the community and less in terms of police protection and law enforcement. There must be a greater readiness to entrust to the state the actual operation of economic services when their conduct by private enterprise has not proved satisfactory. Fifth, law must be conceived as an instrument of social engineering rather than as the mandate of a sovereign political entity. Sixth, the complexity of modern economic and social problems must be met by larger provision for the expert in government and by larger use of advisory bodies. Seventh, the ideology of democracy must

be stripped of its absolutist characteristics. The cult of democracy must give place entirely to a pragmatic approach to the problems of government. Democratic institutions such as universal suffrage and majority rule must cease to be sacrosanct. Eighth, the purpose of government must include as one of its essential elements the provision of as large a share as possible to each individual of the good life. Whether, reorganized on the basis of these ideas, government will cease to be democratic in the conventional sense is perhaps immaterial. It will have become adjusted to the changing needs and requirements of a dynamic world.

UNITED STATES. A flash of political inventiveness in the late eighteenth century, creating by adaptation rather than innovation and making terms with instant necessities, fixed the grand pattern of government in the United States. Written and relatively rigid constitutions energized by judicial review have engendered and in turn have been sustained by a legalism which has not been lacking in paradoxes, for the rule of law and the aristocracy of the robe have been qualified by a frontier impatience. The constitutional framework left room for far reaching modifications through complementary legislation and through usage. The zest for contrivance and adjustment in minor matters has been amazing. The passing years, however, have left standing the major features of the structure: limited government, federalism and the scheme of separately chosen executives who share with bicameral legislatures the uncertain responsibilities of leadership.

The system has combined elements of vigor and feebleness verging on paralysis. This was the natural and indeed intentional outcome of the ideas and circumstances which shaped the constitution and which reacted through it upon institutions already formed and those to follow. Tepid streams of English thought, traceable to springs as fresh as Harrington and Locke, drew from an economic interpretation of politics the notion that safety, especially for property, must be sought in the calculated balancing of diverse

interests. The conception that economic relations might be automatically self-regulatory had been proclaimed and the basis laid for what was destined to pass as liberalism in the next century, although in the New World impatient men of affairs were less willing than they became later to sacrifice convenience to a doctrine. French thought, so far as it was represented by the judicious Montesquieu, seemed to support the ideal of counterpoise. When the constitution was being considered, the influence of French radicalism had declined in the United States. Moreover, even to the extent that its outlook was accepted it did not encourage the devising of governmental machinery which would be responsive and strong. Its confidence was in man rather than institutions. In the late eighteenth century the ideal of a puissant government was linked to a grudging view of human nature. This attitude was indeed widespread; numerous names from Hobbes to Hume were invoked to support it. Such distrust although authoritative in temper tended to negate itself. The outcome of these intermingled and partly conflicting intellectual elements was more likely to be a poised than a positive state.

Practical considerations, which were more important than abstract ideas in the making of the constitution, led to the same result. Recent experience was a compelling factor. The revolution had been attended by a relaxation of authority. The back country especially was full of agrarian ferment. The state governments, freed from colonial restraints, were ready instruments of discontent. Some state legislatures had already acted alarmingly from the standpoint of those whose welfare rested upon the honorable discharge of obligations. There were thus vital elements, partly commercial and partly respectably landed, which felt the need of a restrictive power. In this respect the movement for a stronger central government was negative in that its object was to lessen the risk of state action, which at the best would be disparate and variable and which might be invidious. Inaction or weakness on the part of state authorities in the face of disturbances might be equally dangerous. There must be an organ in the union capable of holding fast in emergencies. In addition, in a more positive way, it was desirable that the central government should be able to facilitate commerce and industry, to protect westward expansion and to secure abroad the respect indispensable to effective negotiations.

The convention which met in 1787 ostensibly

to consider a revision of the Articles of Confederation and which framed a new and genuinely federal constitution can be regarded as the decisive step in a counter-revolution. The degree of agreement among its members was more remarkable than the differences, although obvious compromises were struck between states of large and of small population and between the sections where slavery was important and where it was practically absent. The chief compromise was with an attitude which was more clearly revealed in the special ratifying conventions in the several states, although even these did not reflect fully the reluctance with which the proposed constitution was viewed. Under the circumstances its shrewd authors asked only what seemed necessary in the light of immediate exigencies. A surer basis was provided for the means of defense and of development by enabling the central government to tax individuals. The grant of power over interstate and foreign commerce accomplished a double purpose, for it carried an implied restriction on interference by the states. The nationalizing of money served the ends of convenience and safety. The latter were further protected by certain express prohibitions laid on the states, notably in behalf of the obligation of contracts. There was additional reassurance in the provisions which permitted the elaboration of a network of federal courts and which gave them jurisdiction not only over controversies involving the constitution, laws and treaties of the union but also in disputes between residents of different states. The creation of the office of president—to be filled independently of Congress for a fixed term of four years, to be the focus of all appointments and to exercise initiative in foreign affairs and incalculable power in time of war—was hardly a promise of effectively harmonious political leadership, nor was it intended to be; but it seemed to guarantee that, whatever befell, the wheels of administration would continue to turn.

The novelty in the construction as a whole was largely a matter of recombination. Nearly every structural feature that was adopted was found in one or more of the state constitutions, which although in course of active development since 1776 rested in turn upon colonial foundations. In addition there were changes in emphasis that amounted to creation. In transforming the confederation into a closer union undue theoretical stress may have been laid upon the necessity of freeing the central government from dependence upon the states as entities, but the

step was momentous in the history of federalism. The single executive, his powers and even the mode of election finally devised were suggested by conditions in various states; the isolation of the office, however, was freshly accented. New too was the weight given to the judiciary.

The document which became effective in 1789 has been changed relatively little by formal amendments. The process has not been easy, but the inhibitions have been deeper than the method, lying in attitudes engendered by the constitutional system as a whole. It was provided that amendments might be proposed by Congress with the approval of two thirds of those voting in each house or by a convention to be convened in a manner arranged by Congress upon receipt of petitions from the legislatures of at least two thirds of the states. In either case amendments must be ratified in at least three fourths of the states, speaking through their legislatures or through special conventions. The references to the matter in the constitution, like its provisions on most points, were full of ambiguities, not all of which have yet been resolved. It has been assumed that the discretion of Congress is vast and that it may select the mode of ratification in each instance and in addition set a time limit or not as it pleases. In practise all of the nineteen amendments have been submitted by Congress and ratified by the state legislatures. The difficulties in the procedure are obvious, although mitigated somewhat by an administrative rule which has prevented a state from withdrawing an assent once given to a pending amendment while permitting a change of mind in the other direction. It is significant that only five amendments have been submitted which have failed of ratification: two in 1789 and one in 1811—none vital; another in 1861, being an abortive gesture of reassurance to slavery; and still another in 1924, involving the attempt to enable Congress to restrict the employment of minors. A striking feature of the amendments thus far adopted has been the slight extent to which they have contributed to the growth of legislative power. The first ten amendments, popularly called the Bill of Rights, were drawn on the basis of suggestions from the state conventions that ratified the original constitution and were part of a virtual bargain incidental to its adoption; they restrict only the national government and their practical effect was further to circumscribe Congress. The amendments adopted at the close of the Civil War—notably the Fourteenth, proclaimed in 1866—broadened

the federal judicial veto of state action but not the power of Congress to legislate affirmatively. Two amendments only have importantly enlarged the field of national legislation. The Sixteenth, adopted in 1913, in freeing income taxation from the rule that had required the apportionment of so-called direct taxes among the states according to population made possible a significant and far reaching revolution in federal finance. The Eighteenth, which took effect in 1919, was itself a police measure, for it made illegal the manufacture and sale of intoxicating beverages.

The rarity of changes in the letter has not prevented profound alterations in the spirit of the constitution. The laconic and frequently cryptic language of the document itself has facilitated an unending process of interpretation, in which the legislature and the executive have taken the initiative in exploring the implications of every grant of power. The last word has usually been said by the courts, although some major constitutional problems have been settled without them, either because the questions were never raised judicially or were held to be "political" or were presented after they had been answered by long continued and irrevocable usage. So fundamental a matter as the ability of Congress to appropriate money and to institute permissive services without regard to its enumerated powers was decided affirmatively by the sheer weight of practise. Custom too has subtly modified many features of the lawful plan. The realities of party life, for example, have affected nearly every phase of the government. Their transforming power was early illustrated when by the simple method of pledging presidential electors the electoral college was immediately stripped of its deliberative role and turned into a mere device for counting popular votes. The capacity for accommodation in the constitutional system has seemed inexhaustible. Unfortunately the cramping disadvantages that attend adjustment through indirection and subterfuge have been slighted in the face of a perennial wonder that the scheme could work at all in a changing world.

Adaptation has been accomplished partly through the constant revision of state constitutions. By this means a new foundation was given to the government as a whole when the suffrage, once closely restricted, was progressively broadened. The federal constitution provided that in each state the presidential electors should be chosen in such manner as the legislature might determine and that the representatives in Con-

gress (and since the adoption of the Seventeenth Amendment in 1913, the senators also) should be elected by those qualified to vote for members of the more numerous branch of the state legislature. This devolution of responsibility for a fundamental institution facilitated the political metamorphosis that accompanied what was virtually a social revolution during the decades before the Civil War, when frontier democracy was strong and a new ferment was rising in the cities. Later, states began to enfranchise women. The amendments incidental to the Civil War restricted but did not take away state control of suffrage. The clause in the Fourteenth Amendment which threatened a reduction of representation was never applied; the Fifteenth provided in effect that whatever the qualifications set by the states they must not relate to "race, color or previous condition of servitude." To these in 1920 the Nineteenth Amendment added sex. Meanwhile universal suffrage had been qualified in the south by combinations of taxpaying and educational requirements, supplemented by the machinery of registration. In other sections the adoption of literacy tests after the World War indicated that enfranchisement might have run its course. Not only the right to vote but also the operations of parties, which had become integral parts of the electoral process, fell within the control of the states. Toward the close of the nineteenth century the legislatures began to prescribe many features of party organization. Amid much that was perfunctory the citizen's relation to government was sometimes vitally affected. At a time when rivalry between parties was lacking in most parts of the country the provision that candidates for elective offices should be chosen in preliminary elections (direct primaries) has facilitated the juncture of forces which might otherwise have been divided and impotent.

The federal system is based upon the principle that the organs of the central government may exercise only the powers which are delegated to them, whereas the state legislatures have residual or reserved authority in the sense that they can do anything which is not forbidden by the Constitution of the United States or by that of the state and which is not inconsistent with actions of the national government, always supreme in its proper sphere. The matters which are expressly vested in the latter comprise the following: foreign affairs; defense, including (in addition to the maintenance of exclusively national forces) the right to direct the mode of

organizing militia and to commandeer it; taxation and borrowing; currency; foreign and interstate commerce; post offices and post roads; bankruptcy; patents and copyrights; weights and measures; naturalization; intoxicating liquors; the management of areas acquired with state consent for federal purposes, including the district which is the seat of the union; and through the courts (in addition to the enforcement of national law) the settlement of controversies between states and between residents of different states. The allotment of jurisdiction is for the most part concurrent, not exclusive. There are a few express exceptions, notably in the restrictions on the states in connection with foreign affairs and currency and in the provision for uniform rules respecting naturalization and bankruptcies. An important implied exception is the negative turn given by the courts to the clause that empowers Congress "to regulate commerce with foreign nations, and among the several states." The rule that the states cannot interfere with such commerce has been qualified in favor of various kinds of police legislation, but—even more than the stipulation that "the citizens of each state shall be entitled to the privileges and immunities of citizens in the several states"—it has nationalized the treatment of business. An incidental result has been to embarrass effective state control of economic matters unless attended by complementary national action. A large proportion of the regulatory enactments of Congress can be traced to this predicament.

Limited government, especially when federal, invites conflicting groups to couch their grim struggles as questions in the meaning of words. The course of constitutional interpretation has been fluctuating, not straightforward. On the whole the powers implied in those enumerated in the constitution have been allowed to expand, relieving much of the strain due to the unstable equilibrium of the system. Limits have been set, at least temporarily, to the potentialities of the two most ductile clauses. Regulation under the commerce power, where the articles dealt with are harmless in themselves, was seriously circumscribed by the invalidation of an act that sought to bar the products of child labor from interstate commerce [*Hammer v. Dagenhart*, 247 U. S. 251 (1918)]. The use of the national taxing power, although sanctioned by many precedents, was checked by the voiding of a prohibitively heavy tax upon the profits of establishments that employed children [*Bailey v.*

Drexel Furniture Co., 259 U. S. 20 (1922)]. On the other hand, no limit has been set or is now likely to appropriations and administrative activities which do not involve direct coercion. The role of "the spending power of Congress" has already been momentous; it is questionable whether the federal system as drawn could have survived without it. The shifts by which the system keeps pace with events are increasingly administrative in a broad sense of the term. An immediate effect is to break down the strict separation of national and state administration which (after an initial period when state facilities were utilized optionally for numerous purposes under national laws) prevailed so long and generally that a fictitious constitutional necessity was imputed to it. Apart from factors of universal application, which despite geographical divisions tend to bring about some kind of union within every major function of government, dual administration is rendered additionally impracticable in the United States by the fact that the national legislative powers do not embrace whole subjects but phases only.

The value of administrative modes of accommodation is notably illustrated in connection with uniformity. The problem is a severe one. No other federal system has as many as forty-eight states. The frequent use of rivers as boundaries (not to mention more serious aspects of a lack of conformity between economic and political geography) has caused many important cities to arise at the edges of states, where business which is really local is technically interstate in character. The existence of common law in all jurisdictions except Louisiana has doubtless mitigated the confusion. In the growing field of statutes, the activities of commissioners on uniform state laws since 1889 have had marked success only in relatively limited phases of commercial law. Much more effective are the specialized associations of administrative officers, who are united by technique and who can supply separately a continuing impetus on behalf of their recommendations as a group. When adequate administrative discretion is allowed, such associations facilitate the maintenance of flexible uniformity through common regulations.

The geographical pattern of government within the states varies considerably. Local institutions developed differently in New England and the south and the elements have been mixed in other sections. Generally speaking, the entire area of a state is divided into counties and the latter into townships. Clusters of people may be

separately organized as villages; larger masses, as cities. In addition, partly because of the inadequacy of existing units, there has been a multiplication of ad hoc districts and corporations. The whole has been characterized by local self-government in the sense of the local choice of officers, who although minutely conditioned by state laws have not been subject to administrative supervision. Incidentally local officers have been responsible for enforcing many state laws of general concern. The check on them has been judicial and therefore sporadic and spasmodic. The dependence of local government on the state legislatures has nevertheless been galling. The attempt to prohibit special legislation for cities aggravated rather than relieved the problem, for it militated against the variety inherent in municipal affairs. In nearly a score of states liberation has been sought by introducing a species of federalism (*see* HOME RULE) which permits the exercise of power regarding matters of local concern under locally made charters. The devolution has been too grudging to be revolutionary. Legislative decentralization is not likely to go far until effective administrative supervision has been perfected. The growth of such supervision has been the most striking change in the relation of states to localities.

Internally the organization of the national and state governments rests upon the assumption of a separation of powers. The phrase is a vague one, serving variously to indicate a structural feature, a rule of law and a maxim. The separation that exists is really of authorities, for powers have been deliberately mixed in order to complicate the checks that are intended both to curb temporary majorities and also to lessen the risks of arbitrary action. Few governments have respected less the distinction between legislation marked by generality and stable, unbiased administration. As a rule of law separation of powers in the national constitution does not result from any explicit distributing clause but from the fact that legislative, executive and judicial powers are separately referred to and are vested respectively in the Congress, the president and the courts. The abstract doctrine has been influential but in fact has played little overt part in developing such notions as that legislative power cannot be delegated, that no restrictions can be placed on the president's power of removal and that the courts will not perform non-judicial functions. In the states despite the permission that federalism extended in behalf of diversity (stipulating only that the forms be

"republican") major variations have been regrettably few; the national prototype is aped even in the stir of current administrative reform. Local government, beginning amorphously with dominant councils, did not escape the contagion of the example, and independently elected mayors became general in cities. Innovation has, however, been bolder locally than elsewhere. Managers who are appointed by councils and who are supposedly professional have been introduced in hundreds of municipalities. The responsibilities of leadership unfortunately are still ambiguous.

The scheme of separately elected chief executives has reacted profoundly upon the structure of parties and the tone of politics. More than any other factor it has created and maintained a two-party system. Its centripetal force has partly offset the sectionalism which in a country wherein spatial considerations are likely to be important at all times has been especially rife during a century of unevenly progressive settlement. Nationally considered the major parties can best be described as loose leagues to capture the presidency. They have joined state organizations which in turn have been hardly more than confederations of county elements. Their quadrennial conventions (constituted voluntarily in a twilight zone between national and state power) have never gone beyond bare necessities. No traditions of training, no regular lines of recruitment, have developed to facilitate the selection of presidents and to foster continuity of leadership. The instability has been aggravated by the custom which frowns on more than two terms for any president. On the other hand, the system contains the ever present possibility of fresh blood. From the standpoint of trenchant criticism and vigorous politics the effect of presidential government has been blighting. The party which does not control the presidency not only lacks a focus of policy but must also contend against its prestige. What has been said of the presidency applies even more strongly to the governors, who are elected in all states. The term is four years in about half the cases; elsewhere it is less. Policy is inevitably spasmodic. In the face of so much disjunction it has become popular to apologize for party machines as coordinating mechanisms.

Legislative bodies in the United States, denied the responsibility of creating the government of the day, have been free to explore the advantages and defects of decentralized leadership in law-making. Bicameralism is general. The two houses

of Congress now have their counterparts in all of the states. The consideration of measures is further spread among a set of standing committees in each chamber; joint committees are the rule only in Massachusetts, Connecticut and Wisconsin. At their best the committees offer specialization without the preconceptions of administrative officials. Actual lawmaking presents the paradox of rigorous party control of legislative organization and nevertheless relatively little partisanship in the passage of bills. The reason for the latter lies to some extent in the nature of existing parties but, aside from their incompatibilities, it can be traced in part to the interplay of a stubborn localism and the lobbying conducted by single purpose leagues and self-protective associations. They render opinion dynamic. The parties are harvesters, not sowers; occasionally, when vital interests are affected, they intervene actively. The congestion of the legislative calendars is its own partial cathartic; minor measures are passed by unanimous consent. These characteristics of Congress and the state legislatures are reflected in their products. The bright, sometimes brilliant but essentially petty achievements of non-partisanship are found in plenty. Coherent purposes are nearly wholly lacking.

In electing legislators single member districts and plurality choice are nearly universal. Election at large now exists in some cities and in a very few the "single transferable vote" has been introduced, although in combination with the non-partisan ballot. Two United States senators are elected in each state for terms of six years. Renewal in the Senate is partial, one third being chosen every two years at the time when the entire membership of the House of Representatives is elected. The latter has been pegged by law at 435. In the state legislatures biennial sessions have become the rule. Apportionment continues to provoke the rivalry of city and countryside and of the deeper interests they involve. Equal representation in the United States Senate, although practically unimportant in voicing the claims of state governments as such, has so increased the leverage of certain areas that aided by non-restrictive rules of procedure the Senate has become the chief forum for the critics of an overweening industrialism. In many states, on the other hand, the over-representation of agricultural backwaters in the legislatures, fixed in constitutions, has handicapped the cosmopolitan, proletarian impulses of the cities.

The maladjustment of legislative apportionment lends significance to the machinery for direct popular action on measures, quite apart from the reasons that originally prompted it. The referendum is mandatory in the ratification of constitutional amendments in practically every state. In about half of the states there are schemes for the submission of statutory (and sometimes constitutional) proposals by petition (the initiative) and for allowing measures already enacted to be brought before the electorate either at the option of the legislature or upon petition (called the referendum in either case). The possibility of a popular appeal sometimes liberates a new kind of leadership and the effect may be to shift the center of gravity, but in general the sources of energy in lawmaking are the same whether the engine is direct or representative. The initiative and referendum have ceased to spread; the idea of avoiding the confusion of issues, however, is likely to remain vital so long as some are more embarrassing than others.

An unusual amount of law is judge made, loosely speaking, in the double sense that common law prevails and that statutes as well as administrative determinations are subject to judicial review. The power assumed by the courts to decline to apply laws that they deem unconstitutional is more securely held because (save in the case of advisory opinions in some of the states) it is exercised incidentally to the handling of controversies. The basis of a remedy against its overuse already exists in the rule that doubts should be resolved in favor of the legislative body. The further step is to recognize how largely the meaning of the troublesomely broad constitutional provisions is a question of fact. The same considerations will lead to a relaxation of judicial review of administrative determinations. Meanwhile within the administration itself tribunals and appellate procedures are being devised which may result in an approximation to *droit administratif*.

The abandonment of *laissez faire* is indicated most forcefully in the multiplication of ad hoc regulatory boards. Far from representing sound legislation and perfected administration, they are significant as confessions of a need and as the crude beginnings of control. A society intent on exploitation and schooled to leave adjustments to initiative and competition has become uncomfortable and been forced to act without knowing what it wished to do. The first steps have taken the form of a congeries of unrelated statutes nearly devoid of policy, by which un-

digested problems have been devolved upon amorphous agencies that administer a kind of compulsory arbitration among conflicting interests.

Government in the United States takes up new tasks with the handicap of obstinate if not irremediable administrative deficiencies. Pioneering folk belittled experts and distrusted bureaucracy. The civil service was further weakened by the more glamorous as well as substantial inducements offered by private enterprise. The latter debauched what it affected to despise; a complicated system of spoils became the *modus vivendi* of its relations with government. Beginning definitely in 1883, selection by examination was introduced under the name merit system. Although now well developed in the national services it has been adopted in barely one fourth of the states and in only a part of the large cities. Moreover, even where it is used it is still vitiated by the shaky character of its foundation in bipartisan, inexpert civil service commissions and by failure to carry its principles high enough. The ideal of the system has been practical examinations adjusted to duties of particular offices. This has been true even in the tests that have taken the flexible form of requirements of education and experience. Tardily, in the light of notable tendencies toward permanence and promotion within the civil service, its relation to the educational system as a whole is being considered. Political institutions in the United States are slow in correcting the lack of organic union with the society in which they operate.

BRITISH EMPIRE. *Great Britain*. The British system of government is that of a limited monarchy expressing its essential ethos through parliamentary forms. Little of its basic character has been reduced to writing, and its institutions are continually changing under the influence of social pressure from different classes. It was essentially an aristocratic system in the mid-Victorian age, and, although the realization of uni-

versal suffrage in 1928 made it externally an extreme democracy, the influence of the historic aristocracy upon its functioning is probably still greater than in any other European state.

At the apex of the governmental pyramid stands the crown. The legal powers of the king are still in theory immense. He can legally declare war and make peace. He can disband the army and navy. He is the sole fountain of honor. He can refuse his assent to legislation and dismiss a government which commands a majority in the House of Commons. But as the result of a long process of evolution, which effectively begins with the struggle between crown and Parliament under the Stuarts, the king has become a dignified influence rather than an active source of power. He must in fact act upon the advice of his ministers, and it is substantially true that he could not in fact deliberately act counter to their advice without a constitutional revolution, the ultimate consequences of which it would be difficult to foresee.

This does not mean that the influence of the king is not important. He may have lost the right to refuse his assent to legislation. He may have no practical alternative but to choose as his prime minister the leader of the party to which the electorate has given a majority in the House of Commons; it is almost certain that he could not now refuse dissolution to a prime minister who asked for it. But, as Bagehot said, he still retains the right to "advise, encourage and warn." He sees all the relevant official papers and may annotate them; he must be consulted upon all important changes in the policy and personnel of government. In a period of party crisis his immense national prestige confers great weight upon the advice he may choose to give. No one who studies the part played by the crown in the conflict over the House of Lords in 1911, over the Ulster crisis of 1913-14 or in the formation of the national government in 1931 can possibly doubt that he still plays a considerable part in the working of the constitution. It is none the less real because it is largely hidden from the public; and although doubtless in any serious difference between him and his ministers he must always give way, it would be a wholly mistaken estimate of his position to regard him as no more than a decorative symbol which binds together the different parts of the constitution. If he has to play the part of a neutral observer, such vital documents as the correspondence of Queen Victoria show how significant a pressure is still regarded as compatible with that role.

Accessioned No. 327

The true executive for practical purposes in the British system is the cabinet. This may be defined as a committee of the party or parties which can command a majority in the House of Commons. Its members are all privy councillors, and the cabinet may be said to have grown out of a group of royal advisers upon the Privy Council who gradually came to preside over the important departments of state. Until the reign of Anne the sovereign still presided over their meetings, but largely as a result of George I's ignorance of the English language that practise has been obsolete for over two hundred years. In its essential modern form the cabinet may be said to date from the time of the younger Pitt, for it was under him that its primary characteristics—secrecy, unity of outlook, collective responsibility and the supreme position of the prime minister over his colleagues—became definitive. Although its methods of working have altered as new needs have grown, these are still its basic qualities. Until 1917 it had neither a secretariat nor archives, as these were held to violate the secrecy of its proceedings; but in that year the prime minister (Lloyd George) set up a secretariat because the immense growth of business made necessary a strict record of the decisions taken. Although occasional protests continue to be made against the innovation, it seems probable that the secretariat has now become an established and integral part of cabinet machinery.

The pivot of the cabinet is the prime minister. Curiously enough, although the office may be said to date from Sir Robert Walpole in a general way and quite definitely from the younger Pitt's premiership in 1783, it never received official recognition until 1878, when in the protocol of the Treaty of Berlin Lord Beaconsfield was formally given that title. It is still an office without emolument; the prime minister usually (although not necessarily) becomes first lord of the Treasury, an office with no departmental duties. The prime minister, who becomes such by successfully accepting the king's invitation to form a ministry, has immense authority. He personally invites other politicians to accept places in the cabinet; he determines both its size and the disposition of offices; and it is a convention of the system that he may ask for the resignation of any colleague at any time. He presides over its meetings and largely controls its agenda. He is in fact the essential coordinator of policy and almost a court of appeal between other colleagues in conflict. He largely determines the order and char-

acter of legislative business (although he must carry important colleagues with him in so doing) and he is the essential agent in distributing the honors conferred by the crown. He is further the channel of communication between the king and the cabinet, and it is understood that the power to ask the king to dissolve Parliament belongs to him exclusively. In 1874 Gladstone and in 1924 Ramsay MacDonald obtained permission from the crown to dissolve Parliament without any previous consultation with their colleagues. Until 1902 it was still possible for the prime minister to be a peer; the precedent of 1923, when on the advice of all living ex-prime ministers King George preferred Baldwin to Lord Curzon, probably marks the final necessity that the prime minister be a member of the House of Commons. That is where essential discussion and decision take place; and a prime minister who could not lead that assembly probably could not now maintain his authority in the cabinet.

The average cabinet today consists of twenty-one or twenty-two members; a hundred years ago its average size was twelve. It is a reflection of the changed social character of Great Britain that, whereas until the mid-Victorian period the majority of its members were peers, there are now rarely more than three or four peers in a cabinet. It usually consists of the political heads of the great departments, together with two or three ministers (the lord president of the council and the lord privy seal particularly) who have no effective departmental functions; and a special preeminence belongs to the chancellor of the Exchequer as the coordinator of finance and to the foreign secretary. On two occasions, in 1912 and in 1925, the attorney general has belonged to the cabinet, but in view of his quasi-judicial functions this innovation is frowned upon by constitutional purists.

The modern tendency (most notably since 1918) is for the cabinet to deal with large problems involving the consideration of detail through committees which then report to the cabinet as a whole; this is an obvious convenience where experts have to be examined and great masses of work have to be gone through. There is a tendency also for the cabinet to be divided into an inner and an outer cabinet, distinguished less by the offices held by members than by their importance in the party or parties upon whose vote the cabinet depends. Much vital business is decided by the inner cabinet without necessarily consulting the cabinet as a whole; it is said by Lord Haldane that the decision to ini-

tiate military conversations between Great Britain and France was undertaken by agreement between the prime minister and four other members of the cabinet.

As an institution the modern cabinet seems to suffer from two grave defects. It is, in the first place, too large for effective discussion as a unit; and its members are mostly so overwhelmed by the pressure of business that they have too little time to devote to the general cabinet problems outside their own realm. Nor is the relation between the cabinet and the party behind it wholly satisfactory; recent developments in the Labour party suggest that the initiatory power of a secret committee to which private members of Parliament have no access may easily separate the mind of the cabinet from that of the party upon which it depends. Dubious too is the overwhelming power of the prime minister, particularly through his exercise of the power over dissolution. From being *primus inter pares* in the mid-Victorian period he has become much more akin in function to the president of the United States. Many proposals of reform have been discussed in the last ten years, mainly, however, through private initiative; they have not received even semi-official approval and it is improbable that any of them will go into operation except in terms of a thorough institutional reconstruction.

Behind and below the cabinet are the political undersecretaries on the one side and the departments, manned by the civil service, on the other. The former may be described as hopeful apprentices to cabinet office; apart from the financial secretary to the Treasury they can hardly be said to possess a definite sphere of function; their duties largely depend on the zeal, generosity and ambition of their political chiefs. An undersecretary whose chief is in the House of Lords may make a name for himself by that fortunate accident, but in general it cannot be said that the office of undersecretary has been seriously or properly utilized. It is still a way of trying out a young man on minor duties rather than a method of cooperation for proper political control in the department on the one side and an adequate relief to a cabinet minister's time on the other.

The British civil service is in some ways the most vital part of the system of government, and its evolution in the last sixty years is perhaps the most important contribution made in recent times to the technique of representative government. Until 1870 the civil service presented many of the worst features of a patronage sys-

tem, and John Bright's description of the Foreign Office as the outdoor relief department of the British aristocracy is not an unfair description of its character until that date. In 1854 a report by Sir Charles Trevelyan and Sir Stafford Northcote upon the organization of the civil service recommended that appointment by competitive examination should take the place of appointment by nomination. The report, as Sir Charles Trevelyan has stated, was the outcome of the fears produced by the revolutions of 1848 and it was put into operation by Gladstone in 1870. Since that time subsequent investigation has only confirmed the value of the principal recommendations made. Specialists (e.g. doctors and lawyers) and exceptional nominations apart, the service is now normally recruited by examinations devised to test general intelligence at the main stages of the educational system. Broadly speaking, it is divided into four main classes: writing assistants, who perform the mechanical tasks of an office; clerical assistants, who do routine work involving minor responsibility; the executive class, who do work which involves some degree of initiative and creativeness; the administrative class, who are concerned in the making of policy and accept the essential departmental responsibility. The service as a whole consists of some three hundred thousand persons, if the Post Office be included; but the whole administrative class, who are recruited at the stage of a university degree, number only about fifteen hundred. They have pretty complete security of tenure, a considerable degree of self-government (under the Whitley system) and normally retire at sixty with a pension.

It is difficult in a brief space to give any adequate idea of the character of these officials; perhaps it is sufficient to say that they constitute the only public service in Europe which has been able to combine bureaucratic efficiency with liberalism. It has maintained, on the whole, a remarkable tradition of loyal neutrality between governments of differing party complexion. It has shown remarkable inventiveness in adapting the police state of the nineteenth century to the needs of the social service state in the twentieth; an inventiveness perhaps due in large part to the fact that its most important members, the Foreign Office apart, have been drawn from the middle classes rather than from the aristocracy. The whole difference between an effective and an ineffective minister may be said to lie in his ability properly to utilize the inventiveness of his high officials. Although they remain largely

unknown to the great public they have a position which confers both dignity and power. They are on the whole free from the multitudinous embarrassments of red tape; and they have not so far displayed that tendency to a caste spirit which so often arises from a well settled corporate tradition. Probably no small part of this advantage is due to two facts: that there is a constant movement of high officials from one department to another, and that the general administrator is always supreme over the specialist expert. Admission to the service is controlled by an independent commission which is itself composed of civil servants, and the control of the establishment problems of the departments is centralized in a branch of the Treasury without whose concurrence no action can be taken.

The legislative assembly of Great Britain consists of the House of Lords and the House of Commons. The former chamber is composed of some 750 members. These are largely hereditary peers of the United Kingdom; but there are also the princes of the blood royal (who take no part in debate), twenty-four bishops of the Church of England, sixteen representative peers who are elected by the Scottish peers (and who sit for the lifetime of each Parliament), the remains of the declining Irish peerage (originally elected for life, the system being abolished by the Irish Treaty Act of 1921) and six law lords who sit for life. Until 1911 the powers of the House of Lords were theoretically the same as those of the House of Commons; although it has been a well settled convention since the Restoration—broken only in 1860—that the House of Lords should not touch a finance bill and that it should give way before the determined will of the lower House. In 1909, however, the Lords, which had already rejected a large number of bills proposed by the Liberal government, was persuaded to reject the budget of that year; and the prime minister after receiving a mandate from two general elections fought upon the issue forced through an amendment of its powers under a threat to create sufficient peers to overcome any possible opposition. The House of Lords can now neither amend nor reject a finance bill which is defined by the Parliament Act of 1911 as a bill so certified by the speaker of the House of Commons; and any other bill sent to it in the same form in three successive sessions of Parliament now becomes law despite its veto. Its inferior power has thus been translated into definite constitutional terms.

But the position remains thoroughly unsatisfactory. Of the 750 members of the House of Lords barely fifty attend at all regularly; only eight times since 1919 have more than two hundred taken part in a division, while over five hundred have never taken part in a debate. The chamber moreover is not only fairly new—half its membership dates only from 1895—but also overwhelmingly Conservative; there are only some one hundred Liberal and thirteen Labour peers. The chamber therefore tends to be largely inactive when a Conservative government is in office and bitterly hostile to Liberal and Labour governments. It has never produced really distinguished men of its own in modern times; save Lord Rosebery every person since 1874 who has played a distinguished part in its proceedings has originally made a reputation in the House of Commons. There has been general agreement for forty years that the chamber is an anachronism in a democratic state, but it has been impossible to discover principles of reform which would be generally acceptable. The Conservatives demand a large admixture of the hereditary principle, which the Labour party and a large part of the Liberal party reject altogether; the Labour party either desires no second chamber at all or one built upon some such principle as that of Norway; while all parties are agreed that a purely elective or a purely nominated chamber is not desirable. Most men therefore prefer the present position on the ground that a recalcitrant House of Lords can always be overcome in the last resort by the creation of peers. This is, however, a mere avoidance of a grave constitutional issue; and the only prediction that can safely be made is Lord Rosebery's famous aphorism that the House of Lords will pass in a storm.

Since the Redistribution Act of 1918 the House of Commons consists of 615 members, of whom twelve sit for university constituencies. The electorate is composed since 1928 of all adult persons over twenty-one. A mere plurality suffices to return a member, the parties having consistently since 1867 set their faces against any system of proportional representation, although an attempt was made in 1930 to introduce the alternative vote and proportional representation exists, by a curious compromise, in the university constituencies. It therefore often happens that there is a serious disproportion between the number of votes a party secures and the number of seats it obtains in the House of Commons; in 1925 the Baldwin government had

actually a majority of over two hundred and was in a minority of nearly three million votes in the country. University representation, which in the case of Oxford and Cambridge dates from the seventeenth century, is bitterly opposed by the Labour party on the ground that it is merely a method of adding to the number of Conservative members. It is certainly true that no university member has as such made any contribution to the quality of the House of Commons in modern times; Lord Hugh Cecil was, previous to his election for the University of Oxford, member for an ordinary constituency, and the famous classical scholar, Sir Richard Jebb, who sat for a time as member for the University of Cambridge, hardly played any part at all in the proceedings of the House.

The predominant feature of the House of Commons is its domination by the cabinet. The day of the private and independent member has passed, and there seems little reason to suppose that it is ever likely to return. The pressure of business is so great that the ordinary member has lost the opportunity of essential initiative, and the growth of party control has increased in proportion to the greater intervention of government in what was once deemed the realm of private affairs. The private member can still ask questions; the House remains also an admirable assembly for the ventilation of grievance. It performs well what has been termed its selective function; it discriminates with remarkable ability between the men who seek to attain office by impressing it. But it has no longer the time to discuss any subject thoroughly. Its effective power over finance is largely a traditional illusion. The change in the subject matter of debate from broad political to technical economic issues has meant a rapid decay in its power to shape the general process of administration. The immense although necessary growth in delegated legislation indicates that the very essence of the character of the state has changed, and the modern House of Commons has for the most part to be content to play a subordinate role if the necessary business is to be done. It still debates as finely as ever when it is left free to make up its own mind; but these occasions are so rare as to provide the exceptional rather than the normal instance.

The reason lies in the change from an individualist to a collectivist society. Modern England is occupied with the discussion of equality; and this involves a quantitative analysis which it is difficult to make effectively in a legislative as-

sembly of over six hundred persons. In the last century moreover the House of Commons was successful because the two historic parties were agreed in essence about the fundamentals of social life. They could afford, in Lord Balfour's phrase, to "bicker" about the accidentals because they had made a joint bargain with fate. This perspective has been completely altered by the rise of the Labour party. Since it exists to deny the fundamental principles of its opponents, the debate, especially in the light of universal suffrage, has shifted to the question of the rights of property in the state. There is today in Great Britain a notable disproportion in the distribution between political and economic power. The epoch of *laissez faire* has ended, but the House of Commons has not shown itself a very suitable body to determine what is to follow. With all its admirable qualities it looks very like a late eighteenth century institution trying vainly to cope with the problems of the twentieth. It is difficult to believe in the prospect of its success unless it is fundamentally reconstructed.

The success of parliamentary government was built on a partial fusion of the executive with the legislative; the success of the judiciary in Great Britain has been effected ever since the Act of Settlement of 1701 by insisting on its complete independence. There are three ranges of courts, broadly speaking, in England. The High Court is appointed by the lord chancellor, although nominations to the Court of Appeal, the House of Lords and the highest judicial offices, like that of lord chief justice, are made by the prime minister. The county courts, a body of purely civil tribunals dating from 1846, are manned by judges appointed by the lord chancellor. The lower courts are administered either by stipendiary magistrates appointed by the home secretary or by lay justices of the peace appointed (outside the county palatine of Lancaster) by the lord chancellor on the advice of special committees (largely political in complexion) in each area of the country.

The highest courts have great virtues, especially on the criminal side. The judges are genuinely independent and wholly free from any suspicion of corruption or political influence. There is perhaps a tendency to regard judicial appointment as a reward to eminent barristers who have played their part in the House of Commons; it is notable, for instance, that about twice as many judges in the last century have reached the bench through Parliament as from mere distinction at

the bar. It is also notable that in the same period the great judicial figures were either never in the House of Commons at all or else a failure there. The method of executive nomination has not proved very satisfactory in the matter of promotion; and if the system is notable for its administrative efficiency it is extremely costly to the litigant and not wholly satisfactory in the matter of an adequate certainty. It is also proper to note that in the realm of labor law English judges have too frequently displayed that "inarticulate major premise" which gives rise to decisions more notable for zeal than for objectivity.

The lower courts are less satisfactory. Although there have been many admirable county court judges, the tendency is to nominate men who have not been wholly successful at the bar; and there is practically no prospect of promotion. The result is that the county courts, which probably come nearest on the civil side to the lives of the people, are staffed by solid but second rate judges. The magistrates who occupy a paid position on the whole do admirable work, especially in London and on the criminal side. The lay magistrates, however, present a difficult problem. The position is usually the reward of political zeal and the nominees (who sit in couples) are devoid of legal training. The result, as might be imagined, is disproportion in the punishments inflicted, a grave tendency to partisanship in quasi-political and industrial cases and some tendency to class discrimination in minor offenses like disorderly conduct or drunkenness when in charge of a motor vehicle. Nor has any serious attempt been made in England despite recent innovations to deal with the problem of the law and the poor. The conservatism of the legal profession in England is perhaps its most notable feature; and a comprehensive inquiry into law reform in the manner of Bentham's great effort of a century ago is long overdue.

Local government in England is too complex to admit of any brief description; it has not been evolved on principle, but as a growth in terms of pressing need. The system of municipal government largely dates from 1835; that of the counties from 1888. Below these is a mass of lesser authorities—urban districts, rural districts and parishes—mostly late nineteenth century constructions but rarely distinguishable from each other in terms of coherent principle. The present position has well been described as a chaos of areas and of functions. That the system works at all is really due to the powers exercised (largely

through a system of grants-in-aid) by the ministries of Health and Education, whose control secures a desirable minimum of uniformity in policy.

The governance of local bodies has not greatly changed its historic forms. Mayor, aldermen and councilors in the boroughs; chairmen, aldermen and councilors in the counties, are still the usual system. The great changes in the last fifty years have lain in the immense development of the committee system on the one hand and of a trained and specialized local civil service on the other. The former has provided many opportunities for creative work by local politicians; the latter has prevented most of the corruption revealed by the famous inquiry of 1834. The local civil service indeed is not wholly satisfactory. It tends to be too compartmentalized, largely through equating the technician with the administrator; it is usually wanting in coordination and it lacks that imaginative habit of initiative which the central civil service has developed through attracting to its ranks some of the best intelligence trained in the universities. There is also too rigid a control over local experiment through the form in which the powers of local government are conferred; for once an authority steps outside the sphere of defined initiative it must seek parliamentary sanction—a seriously expensive adventure. Control from Whitehall, while admirable in many directions, is probably too rigid in some spheres and too lax in others. And since the local franchise is still confined to ratepayers, except where compulsory standards and objects are imposed upon an authority, for example in education or public health, it tends to mean local government very largely in the interest of ratepayers. Some of the experiments in municipal trading have been remarkable and the educational work of London, Durham and Manchester shows what an eager authority can do. But on the whole the system of local government in England shows competence rather than inspiration, and large revision of its basic principles has become an urgent task. This is undoubtedly realized in Whitehall; but the vested interests of the local authorities are powerfully protected, and it will need a government with immense determination to triumph over their conservatism.

Dominion of Canada. The Dominion of Canada is a federation which is composed of nine provinces and the legal foundation of which is a statute of the imperial Parliament, the British North America Act, 1867, as amended from time to time. This act, however, must be read in the light of the fundamental conventions and common law principles of the British constitution, judicial decisions and certain Canadian statutes, orders in council and local constitutional customs.

Prior to the formation of the dominion considerable support developed for a legislative union like the United Kingdom; but the racial exclusiveness of French Canada and the geographical isolation of the Maritime Provinces made this impossible. Federation was the only practical alternative; "the Fathers," however, sought by creating a strong central government to improve on the American system, which seemed at the time, 1864, to be disintegrating in civil war. The provinces were given the exclusive power to legislate on certain enumerated subjects—some of them very broad, such as "all matters of merely local or private nature" and "property and civil rights in the province"; over two subjects—immigration and agriculture—the dominion and the provinces were given concurrent jurisdiction; to the dominion it was apparently intended should fall the residuum of legislative power. The dominion was also given unlimited powers of taxation, while the provinces were guaranteed a fixed annual subsidy from the dominion and permitted to levy only direct and license taxes. In addition the dominion executive was given power to appoint the lieutenant governors, the formal executives of the provinces, and the right to disallow any provincial act within one year of its receipt from the lieutenant governor. This was essentially Hamilton's scheme for the union of the American states in 1787.

Time, however, has substantially altered the spirit if not the letter of the constitution. The British North America Act as a statute has called for judicial interpretation; and under the influence of the Judicial Committee of the imperial Privy Council, the highest appellate court for the dominion, the powers of the provinces have been liberally construed and strengthened at the expense of the residual power of the dominion. Through the general adoption of cabinet government in the provinces the lieutenant governor has become merely a social functionary who neither reigns nor governs; and hence appointment by the federal government serves to in-

crease only federal patronage, not federal control over the provinces. Disallowance was freely practised during the first three decades in the interests of vested rights of property and of sound legislation and to keep the provinces within the ambit of their powers, but with the judicial strengthening of the constitutional position of the provinces it has tended to fall into disuse. Thus beginning as a Hamiltonian union the Canadian dominion has become a real federation, an indestructible union of indestructible and autonomous provinces.

Executive government in Canada is vested in the king, who acts through his representatives, the governor general in the dominion and the lieutenant governor in the provinces. In both fields convention requires that the governor act only on the advice of ministers politically responsible to the legislature. In addition to the fundamental conventions of the British cabinet system certain local conventions or practises of almost equal force have developed in Canada. Democratic sentiment virtually compels the prime minister to choose all his colleagues from the lower House. In addition tradition demands representation in the cabinet for groups of provinces, and as far as possible for every province, for the Protestant minority in Quebec and the Irish Catholic minority outside Quebec. Similar conventions have arisen in certain provinces. Racial and religious sentiment and sectional interests are vital political facts in Canada, and it has undoubtedly added to the stability of government and the contentment of the governed that these facts have been mirrored in the cabinet.

In the organization of the administrative services the dominion and the provinces at first followed the contemporary British model by placing all branches of the service under ministers responsible to Parliament. In 1903, however, Canada followed American precedent and placed wide powers of regulation over railways in a Board of Railway Commissioners, largely independent of the government of the day. Since then many other boards or commissions, more or less independent of cabinet control, have been set up in the dominion and in the provinces and entrusted with administration over such specific subjects as public utility rates, old age pensions, workmen's compensation, the grain trade and the management of national railways. As for the civil service, only within recent years has the federal service broken the shackles of the spoils system. Since 1908 the greater part of the service has been established on a merit system which

applies alike to appointment and promotion and which is administered by an independent commission. The merit system followed is largely that of ad hoc examination for specific appointments as in the United States, rather than the British system of academic examination to test general ability. Saskatchewan alone of the provinces has a comprehensive merit system; in other provinces the spoils system is still frankly followed.

Legislative power in both the federal and provincial fields is exercised by the crown in Parliament. The whole field of legislative power of the dominion is distributed between the provincial and federal legislatures. No power is reserved to the people as in the United States. Both federal and provincial legislatures within the ambit of their power are sovereign authorities. The dominion Parliament consists of the House of Commons and the Senate. All provinces except Quebec are now unicameral, although at one time four other provinces had upper houses.

The federal Senate consists of ninety-six members appointed for life by the governor general (in reality by the government of the day), twenty-four from each of four sections—the Maritime Provinces, Quebec, Ontario and the four western provinces. Four or eight members (one or two for each section) may be added in case of deadlock of the two houses, but this power has never been used. Intended as a bulwark for provincial rights and as a restraint upon democracy, the Senate was endowed, like the House of Lords at the time, with powers equal to those of the lower House, except that it might not initiate bills for the raising or spending of revenue. But the Senate has had fatal defects: in an age of democracy it has no popular foundation, and appointments have always been treated as party patronage. It tends to be an active critic of government legislation when its majority is politically opposed to the government of the day; at other times it is relatively passive. Under these circumstances the Senate has never enjoyed sufficient popular support to enable it to play an important role.

The House of Commons is elected for five years, although it may be dissolved at any time before the expiration of its statutory term. Quebec has a fixed representation of sixty-five members; other provinces are allotted representatives after each decennial census in the proportion which their respective populations bear to that of Quebec. Since 1915, however, no province may have fewer members in the House of Com-

mons than in the Senate. The dominion Parliament has full power to regulate elections to the House of Commons, including qualifications for the franchise. Universal adult suffrage based on nationality and residence now obtains for federal elections, while in the provinces similar qualifications prevail except in Quebec, where the vote is still denied to women. In Canada as in England political parties are unrecognized by law, except that the leader of the opposition in the dominion Parliament and in certain provinces is paid a statutory salary like a minister of the crown.

The British North America Act of 1867 makes provision for a federal system of courts, but to date only two federal courts, the Supreme and Exchequer courts of Canada, have been created. All other courts are constituted by the provinces. Virtually all judges above the rank of police magistrate are, however, appointed by the federal executive and paid from the federal treasury and hold office on good behavior. The regulation of civil procedure in provincial courts falls to the province, while criminal law and criminal procedure belong exclusively to the dominion. English common law holds in all provinces but Quebec, where French civil law obtains, except in criminal matters. All courts, however constituted, form part of a single judicial system and may be called upon to administer the law whether it emanates from the federal or the provincial legislature or from the imperial Parliament itself. Similarly provincial officers form part of a single system of law enforcement; the officer primarily responsible for the enforcement of criminal law is the provincial attorney general, who acts through subordinate provincial officers.

The administration of justice is perhaps the most creditable phase of government in Canada. Law and order have been effectively maintained throughout the dominion's history. For this the causes would appear to be that a single system of criminal justice prevails throughout the whole dominion; that the judiciary, although not brilliant, has been incorruptible and free from political interference or popular control; and that Canada has in general followed closely recent British procedure, which admits of relatively speedy justice.

As in the United States the final interpretation of the powers of Canadian legislatures falls to the courts. Where questions of legislative competence arise in ordinary cases involving private rights, the courts simply refuse to enforce *ultra vires* statutes. In addition questions may be re-

ferred for advisory opinion by the governor-in-council to the Supreme Court of Canada, or by His Majesty to the Judicial Committee of the Privy Council, a method used for the settlement of many constitutional issues. Since there is no right of suit between the provinces or between a province and the dominion, disputes between these units are also normally settled in the same way.

Local and municipal government is under the control of the province, hence there is considerable variety both in local institutions and in methods of state control. In general, however, the province exercises control largely by legislation and grants-in-aid in such matters as education. Small elected councils are the principal institutions of popular control, although municipal government has been considerably modified by such American practises as popular election of the mayor (the reeve in villages), annual elections, separation of powers between the council and independent boards in such matters as education and control of police, and the plebiscite in important financial matters. Despite these inroads responsibility is still largely concentrated in the council. Because of this fact and the absence of party politics in municipal affairs, municipal and local government has a tolerably good record.

Changes in Canadian political institutions have come less by reason of a priori theory than by pragmatic adaptations to meet the problems of governing half a continent with a relatively small and scattered population and of uniting two compact racial groups into a single political entity. No less important has been the subtle influence of American practises and ideas. Yet despite changes Canadian political institutions remain essentially British.

ROBERT A. MACKAY

Commonwealth of Australia. The Australian Commonwealth is based on two main principles: responsible government and federalism. The first is historically antecedent to the second, having been established in five of the six Australian colonies between 1855 and 1859; in the sixth, Western Australia, it was established in 1890. Before federation the constitutions resembled each other in that they were all contained in or derived from acts of the imperial Parliament; they were all "flexible," with constituent power vested in their legislatures; they all assumed responsible government (resting on convention rather than enactment) and they all established

bicameral legislatures, the cabinet being responsible to the more democratic assembly. This system of government was not disturbed by federation, save that the colonies (which took the name of states) surrendered certain powers to the federal authority.

Since federation constitutional innovation in the states has been concerned with the franchise, systems of voting, relations of the two houses of legislature and the referendum. Woman suffrage has been established in all states. Preferential voting has become general. Queensland instituted compulsory voting in 1915. The Commonwealth Electoral Act of 1924 made both registration and voting compulsory throughout the commonwealth in elections for the commonwealth legislature. Tasmania has established both proportional representation and compulsory voting. Queensland after experimenting with the referendum as a means of deciding conflicts between the two houses abolished the upper house in 1922. Conservative forces in New South Wales have endeavored to use the referendum as support for the upper house. A statute has been passed making its abolition dependent upon the approval of a majority vote of the people. The decision of the Privy Council as to the validity of the statute is to be given in 1932. Abolition is almost impossible except in New South Wales (and formerly Queensland), where the upper houses are constituted by nomination; a government wishing to abolish the upper house in such a case may secure a majority in it by new nominations, although the governor retains a real, if imperfectly defined, discretion in refusing to nominate. In Victoria, South Australia, West Australia and Tasmania the legislative councils are elected on a property franchise, which varies from about 30 to 40 per cent of the lower house franchise. There are various provisions for avoiding deadlocks. The Labour party is pledged to abolish the councils, which check democratic programs although they cannot persistently resist popular feeling.

Local government in the Australian states is comparatively restricted. The colonies started under autocratic centralized government. Centralization has persisted in large measure because it is in harmony with the geographical peculiarities of the country. Close settlement is impossible except in the limited regions of good rainfall; a large part of the continent is still unincorporated and must remain so. There is considerable variety of nomenclature in the local government systems of the various states, but all are based on

the grant of powers by state legislatures and are subject to close supervision by the state government. The existing system in New South Wales derives chiefly from amending and consolidating legislation of 1906. The state is divided into municipalities and shires, or counties. These can unite for certain purposes to form county districts, of which there are now four. Shires are divided into ridings, municipalities into wards. The former are governed by councilors, the latter by aldermen. The franchise is usually limited to owners or rent paying occupiers of ratable property. The functions of shires and municipalities comprise such matters as the care of roads and bridges, local sewerage and water supply, markets, trams and other amenities. Shires and municipalities can raise money by a rate and have limited and strictly regulated borrowing powers; they also receive grants from the state. There is a state department of local government under a cabinet minister. The limited importance of local government in comparison with England and most other countries is shown by the fact that it has little or no concern with such traditionally local matters as police, education, health administration and public benevolence. By contrast the municipalities of the capital cities of Australia perform functions of great importance. The management of metropolitan utilities (for example, by the Melbourne and Metropolitan Board of Works) is on a large scale and is efficient. Municipal government in Australia is generally honest and in the past has been outside party politics. To an increasing extent, however, especially in industrial centers, elections are now being fought on a party basis; and the government of Sydney has been temporarily vested in a commission in an effort to combat corruption.

To the individual citizen state government is more important than local government. Conditions of economic geography and history compelled the state to assume functions which were beyond the power of either private enterprise or local cooperation. State governments are responsible generally for police, justice, education, health, the regulation of commerce and industry (unless interstate in character), public works and public "development," which include land settlement, railway building and management, national roads, water supply and irrigation, agricultural research and information, mining regulation and forest regulation and ownership. In addition some states have at various times maintained government brickyards, timber mills,

bakeries, fisheries and similar enterprises. There is necessarily a large civil service, which sometimes exercises considerable influence at elections but is kept free from patronage and the spoils system by competitive entrance examination and organization under a public service board or commissioner. The entrance examination is not severe, and the grade tests and other devices adopted for promoting merit are not sufficient to secure a generally high level of executive ability. In the ordinary departments of government administration is carried on by a combination of amateur (political head) and expert (permanent civil servant). The great public enterprises, however, are in the hands of variously constituted boards or commissions established by statute. Such organization is devised to free the management of the enterprises from political pressure which would impair efficiency. Political considerations are nevertheless largely responsible for the financial weakness of many public enterprises. Business principles would demand greater independence, but this is hard to reconcile with the principle of responsible government.

Since the proclamation of the commonwealth on January 1, 1901, the British principle of responsible government has been combined with the American principle of federalism. If neither principle has destroyed the other, as was prophesied in the debates on the constitution, the two have not always worked harmoniously together. The first proposals for federation came from outside Australia in Earl Grey's scheme of 1847, and the federation question was kept partially alive by individuals (W. C. Wentworth, C. Gavan Duffy and others) and by minorities which had to contend with public indifference. As the colonies developed and came into closer touch with each other and the outside world they began to feel the practical inconveniences of separation, such as the barriers to intercolonial trade, the beginnings of tariff wars, the problem of defense and inability to deal satisfactorily with immigration questions. Pressure from outside made itself felt through the German occupation of New Guinea, French penal policy in New Caledonia and Asiatic immigration. Public opinion began to see the need of a government which could speak for the whole continent on matters affecting its common welfare. The Federal Council, "a rickety body," was the first institution set up to meet this need in 1885. In 1891 a convention chosen by the colonial legislatures laid down the principles of a federal union; be-

tween 1897 and 1899 a popularly elected convention adopted the present frame of government. After some amendment it was approved by popular referendum and was then embodied with little modification in an act of the imperial Parliament of July 9, 1900. The act recites the desire of the citizens of the six colonies to create "one indissoluble Federal Commonwealth." Equally important, however, was the intention of the federating colonies to retain their existing powers intact "except in respect to such surrenders as may be agreed upon as necessary and incidental to the power and authority of the National Federal Government" (resolutions of the convention of 1891). This intention, which was a product of the strong particularist tendency in Australian history, the strongly practical character of the federal movement and the comparative weakness of external pressure, led the Australians to prefer the American to the Canadian model of federation. Section 106 of the constitution provides that "subject to this Constitution" the preexisting constitutions of the states shall continue "as at the establishment of the Commonwealth," and section 107 reserves to the states all powers not explicitly surrendered to the commonwealth. The states were granted equal representation in the Senate, they retained their own governors and the commonwealth government was given no power of disallowing state legislation. The High Court is the chief arbiter of the fundamental law of the commonwealth. In ordinary litigation the final appeal may be brought to the Privy Council by leave of the Privy Council itself or of the High Court or of the state supreme court from which the appeal is brought direct. In certain essential constitutional matters, however, the High Court alone has the right to allow the appeal to be brought. The High Court has been in practise the "balance wheel" of the constitution.

The commonwealth government, nevertheless, has greatly extended its powers at the expense of the states. The reasons for this are political, financial and legal. The method of election to the Senate, by which the citizens of each state vote as a single constituency, and the strength of party organization have turned the Senate into a party house instead of the champion of "state rights" which it was expected to be. Fundamentally, the people of Australia are more interested in economic issues than constitutional issues; and although direct economic initiative remains with the states, the commonwealth power over immigration and tariff pro-

tection is of prime importance as creating the conditions under which economic enterprise must work. The constitution gave the Federal Parliament concurrent powers with the states in general taxation subject to the general proviso in section 109 that in case of conflict federal laws prevail. It also gave to the commonwealth Parliament exclusive powers over customs and excise. It imposed only a temporary limit to the full exercise of the spending power. As a result, the commonwealth Parliament has been able to use the power of the purse to swing the balance of the constitution in its favor. It has also, in the opinion of some eminent authorities, made use of an indefinite appropriation power to spend money for objects not explicitly included in those assigned to it by section 51 of the constitution. Nevertheless, the Financial Agreement of 1927 achieved a temporary balance in the financial powers of states and commonwealth. The expansion of commonwealth powers through judicial interpretation is best illustrated by the decisions [Engineers' Case, 28 C. L. R. 129 (1920); 44 Hours' Week Case, 37 C. L. R. 466 (1926)] which have given the Commonwealth Court for Conciliation and Arbitration power to regulate the wages and working conditions of state employees and have made its awards paramount over state laws. Until 1920 the majority of the High Court had followed Chief Justice Marshall's principles in interpreting the federal pact, but in that year it adopted a "natural" method of interpretation which ignores "implied prohibitions" and "mutual non-interference."

These considerations together with the unequal incidence of the federal tariff have stimulated secession movements, particularly in Western Australia. In contrast with the secession movements is the Labour policy of unification. Amendment of the constitution requires a majority of the voters and of the states in a referendum vote. Although amendment by this process is not intrinsically difficult, experience has shown that it cannot be achieved except by agreement of the political parties. There is thus a perpetual stalemate in the party struggle in so far as it involves constitutional change. The tendency since the war has been toward increasing cooperation between federal and state authorities. The Premiers' Conference, a body unknown to the constitution, is coming to be regarded by the state governments as partial compensation for the Senate's failure. The Loan Council, an assembly of the Australian treasurers, has unified the borrowing machinery of

commonwealth and states and fixes the amount which any government may borrow at a given time, although it has no concern with the objects for which money is borrowed. Both these institutions are coming to be of decisive importance in Australian government, particularly in times of crisis. Both are signs of a tendency in government to act increasingly through conference, co-operation and "influence" as well as by command.

The political parties are slow in adapting themselves to the changing conditions of statesmanship. Until the rise of the Labour party Australian politics had a strongly marked regional and opportunist character. The Labour party introduced a discipline which has been copied by the Country party and to a far less degree by the Nationalist party, the chief anti-Labour force. Under the Labour discipline ministers are responsible to the parliamentary caucus, which is supervised (more or less effectively) by an external executive appointed by the party conference, which in turn derives from the trade unions and the political branches of the Labour party. This system has existed in Australia for many years and is making the old theory of responsible government (as expressed, for example, by Bagehot) obsolete. The tendency is for Parliament to become a diminishing factor in the governmental system.

Self-government in the commonwealth has extended into the sphere of foreign relations. Here again Australian public opinion is hardly conscious of the meaning of dominion status. It is not concerned with legal definitions but insists that the real unity of the empire shall not be impaired.

W. K. HANCOCK

New Zealand. New Zealand is a self-governing dominion of the British Commonwealth of Nations. It has complete autonomy in domestic affairs, participates in imperial conferences, controls dependencies such as the Cook Islands, administers the mandate for western Samoa and shares in the mandate for Nauru.

It was colonized by the New Zealand Company and its subsidiaries. The Maoris ceded sovereignty over it to the British crown by the Treaty of Waitangi in 1840. Until 1852 the governors, administering a species of crown colony government, were in almost constant opposition to the company and the settlers, who insistently demanded self-government. The history of these years illuminates the first mod-

ern period of British economic imperialism by its revelation of the conflict of ideas concerning the rights of native races, disposition of waste lands and responsibility for defense. The New Zealand Constitution Act of 1852 granted representative government but reserved native affairs to the governor. The control of waste lands was handed over to the New Zealand Parliament and the companies also surrendered their lands. Responsible cabinet government dates from 1856, and in 1863 the control of native affairs was obtained by the colony.

The Parliament consists of an elective House of Representatives of eighty members and a Legislative Council of approximately forty members appointed by the governor general for seven-year terms. Since 1892 the governor general has accepted the ministry's advice regarding appointments to the Legislative Council. Public opinion seems content with the revisory powers of the nominated council, and proposals to make it elective have been in abeyance for almost twenty years.

There has been manhood suffrage without property qualifications or plural voting since 1889 and women have voted since 1893. For purposes of representation rural population is weighted by an additional 28 percent, which serves to accentuate the political power of the small farmers in the North Island district. The political influence of the large number of crown tenants and civil servants does not appear excessive. Appointment to the civil service is on a non-political examination basis and little corruption has been known. The Labour party, which is usually in definite minority opposition, numbers some of the civil service unions in its large trade union support. There is no use of the initiative or recall, but under a series of acts beginning with the Alcoholic Liquors Sale Control Bill of 1893 a referendum on the question of the prohibition of the liquor traffic is taken every three years.

The judges of the Supreme Court hold life appointments terminable by a vote of both houses. The lower courts are presided over by permanent stipendiary magistrates. The police and prison systems are centralized and staffed by permanent officers. Standards of justice are high, the independence and integrity of the judiciary is unquestioned, and there have been no serious evidences of police graft in the dominion's history. Procedure is simple and comparatively inexpensive. The legal profession is organized on the British model, except that there is no

distinction between barristers and solicitors. Appeal lies from the Supreme Court to the Privy Council.

From the earliest period the company and then the state have undertaken economic functions to a greater extent than in most other countries. In a new country organization had to be created, and there was a strong feeling derived from the company in favor of group action. This was reenforced by the radicalism of the gold rush immigrants in the 1860's and by the inauguration in 1870 of a national borrowing program for public works and immigration. Immigration and development after 1870 caused congestion and social discontent when economic depression followed falling prices and closer settlement was hindered by land monopoly. The radical program of the 1890's, including graduated land taxation, repurchase, leasing and restriction of area, tariff protection, industrial arbitration, factory legislation, state enterprises, pensions and other welfare measures, was an attempt to break through this situation.

Economic relief came after 1900 with rising prices, the advent of refrigeration for meat and dairy produce and the opening up of the North Island for small scale dairying. The small farmers, who still retain the balance of political power, reversed the radical trend after 1912, but a considerable measure of state economic activity and welfare legislation remains. Public utility services such as education, hospitals, land survey, railways, post office, telephones, cables and radio (including broadcasting), public works and hydro-electric development are organized on a national basis, with results generally considered satisfactory. An elaborate body of factory and welfare legislation includes the Arbitration Court, which has regulated wages and labor conditions since 1894; old age and widows' pensions; the Unemployment Board (since 1930); and a Child Welfare Branch of the Education Department. There are also state life, fire and accident insurance and a Public Trust Office, which competes strongly with the legal profession in probate, conveyancing and executor business. Radical ventures in state enterprise have not been continued, however, and private capitalism, notably freehold farming, is firmly entrenched.

In 1921 a board was established to control the export of meat. The principle has since been extended to dairy produce and other exports (but not to wool). These boards operate under enabling acts but are mainly controlled by the

farmers through their strong rural cooperative organizations. There is government representation on the boards, whose compulsory powers have been used sparingly.

The provincial councils established by the 1852 constitution were powerful, especially after the compact of 1856 gave them control of the waste lands. Education, public works and railways were first developed provincially, particularly by the wealthier southern provinces. Conflict with the central government over the disposal of the waste lands after the national development policy began in 1870 resulted in the abolition of the provincial system in 1876. Since that date New Zealand has had a unitary government of increasing centralization. The system of local government still rests upon the Counties Act and the Municipal Corporation Act, both of 1876, which replaced the provinces by a system of county councils supplemented by municipal institutions and functional bodies such as harbor and drainage boards. The number of local authorities functioning in 1929 was 687. The post-war period witnessed a rapid growth of local borrowing and taxation. There is considerable demand for revision of the complex local government organization.

By the Treaty of Waitangi the Maoris retained the ownership of their lands but difficulties soon developed over land purchases, resulting in two wars, from 1843 to 1847 and from 1860 to 1872. The first unregulated sales were reviewed and largely disallowed by the governors and since 1865 the Native Land Court has functioned efficiently and equitably. Confiscations after the second war accelerated depopulation and left many grievances, but in the present generation considerable progress has been made in settling difficulties and relations are now satisfactory. The Maoris are conserving their remaining lands and have made remarkable economic progress. Since 1867 they have had four members in the lower House and representation also in the Council. There is always a Maori member of the cabinet.

J. B. CONDLIFFE

Union of South Africa. The Union of South Africa was formed out of the four colonies of the Cape of Good Hope, Natal, the Transvaal and the Orange River Colony. The Cape of Good Hope, first colonized in 1652 by the Netherlands East India Company, was occupied by the military forces of Great Britain in 1795. After a brief period under the rule of the Batavian Re-

public, to which it was ceded by the Peace of Amiens, it reverted to British rule in 1806 and the peace negotiations of Vienna finally regularized the British position. Its population strengthened by British immigration, the colony was granted representative institutions on unusually liberal lines in 1852, attained responsible government in 1872 and by a series of annexations reached its present boundaries toward the close of the nineteenth century. Natal owes its origin to the Great Trek—an emigration, heaviest in 1836, of farmers of Dutch origin from the Cape of Good Hope. The Republic of Natal, set up by these hardy pioneers, or *voortrekkers*, was annexed by the British government in 1843. Comparatively few of the *voortrekkers* remain and Natal has become the most English in character of the four provinces. It received representative institutions in 1856 and responsible government in 1893.

The independence of the Transvaal, the scattered territories north of the Vaal, was recognized by Great Britain in 1852 by the Sand River Convention. These territories gradually assumed form as the South African Republic, the constitution of which dated from 1858. Financial chaos and military disasters facilitated the annexation of the republic in 1877. It was given a modified independence under the suzerainty of the British crown as a result of the Boer War of Independence of 1880–81 and the Pretoria Convention and regained almost complete independence under its old name by the London Convention of 1884. The discovery of gold led to the influx of a large number of new immigrants, mainly British. Annexed as the result of the Boer War (1899–1902), it underwent a brief crown colony regime and by royal letters patent of 1906 achieved responsible government without going through any intermediate stage. The Orange Free State, at first loosely connected with the *voortrekker* government in Natal, became a British crown colony in 1848. In 1854 it was disannexed and its independence recognized by the Bloemfontein Convention. Like the Transvaal it became a crown colony after the Boer War and attained responsible government in 1907. The two Boer republics presented certain interesting characteristics. The Orange Free State, the less adventurous of the two, was governed under a rigid constitution as compared with the flexible constitution of the Transvaal. Both had for the greater part of their existence unicameral legislatures. In the South African Republic the executive was quite unique and the original settlers,

forming one of the most thoroughgoing democracies of modern times, constituted a close oligarchy, which ruled the newer settlers and the native population.

Economic difficulties, including especially the questions of the customs union renewal and railway rates, led to the calling of a thoroughly representative National Convention, which met in 1908 and 1909. The constitution drafted by this body was approved by the four colonial parliaments as well as by a popular referendum in Natal and formed the basis of the South Africa Act (9 Edward VII, c. 9) passed by the British Parliament in 1909. On May 31, 1910, exactly eight years after the signing of the peace treaty which ended the Boer War, the Union of South Africa came into being.

The constitution of South Africa is, except for three reserved sections, wholly flexible. The South Africa Act is a creative not a restraining document. The act, it has been said, merely aimed at setting up a sovereign Parliament and making provision for certain matters until that Parliament decided otherwise. The idea of a sovereign Parliament unfettered by constitutional restrictions is deeply rooted in the traditions of the country, the South African Republic having developed it no less than the British colonies.

The Parliament of South Africa consists of the king, a Senate and a House of Assembly. The Senate consists of forty members: eight, four of whom are to represent native interests, are nominated by the governor general in council; the remainder are elected, eight in each province, by electoral colleges made up of the representatives of the province in the House of Assembly and the members of the Provincial Council sitting together and voting according to the single transferable vote system of proportional representation. Senators must be over thirty years of age and elected senators must possess immovable property amounting to £500. The maximum duration of the Senate is ten years, but it may be dissolved at any time simultaneously with the House of Assembly or within 120 days after the dissolution of the House of Assembly. In 1926 the term of the nominated senators was limited to the life of the government. The House of Assembly consists of a maximum of 150 members elected in the ordinary way by single member constituencies. Its maximum duration is five years. Legislation other than money bills may originate in either house. Disputes between the houses are settled by a joint sitting, a system which in normal circumstances operates so as to

give the Senate a suspensive veto for a period of from twelve to eighteen months. The Senate has not hitherto proved a great success. Perhaps its failure is partly accounted for by the fact that there was nothing corresponding to it in the old republic tradition. Despite the provision that four of the eight nominated members of the Senate are to be chosen to represent the interests of the natives the Senate has never inspired native confidence. Recently proposals have been made to use it for giving representation to the voteless natives of the northern provinces and to make it a kind of specialist House in Native Affairs, thereby attracting to it men of talent. The House of Assembly, by reason of the single member system, does not always adequately express the will of the electorate. Diffused minorities are largely unrepresented. The fact that for all practical purposes non-Europeans are disfranchised (except in the Cape of Good Hope) and are totally excluded from membership of both houses is a great weakness in the eyes at least of non-South African critics.

The union executive follows the usual British dominion model. The maximum number of ministers in the cabinet is eleven. The English system of a permanent departmental head (secretary) under the political departmental head (minister) prevails in South Africa. Permanent boards and commissions have been set up for the administration of the railways and harbors, all of which are publicly owned and operated, native affairs, the tariff and minimum wages and for the development of the electrical supply and the iron and steel industry. A Public Service Commission of three members, nominated by the governor general in council, exercises a general supervision over the personnel of the administration. Although there have been individual cases of political patronage, nothing in the shape of an organized spoils system exists.

The administration of justice is entirely in the hands of the union; there is no separate provincial or municipal judiciary. The constitution established one Supreme Court for the entire union; the preexisting superior courts in the provinces were made divisions of the Supreme Court of South Africa. An Appellate Division of the union Supreme Court serves as the court of final appeal. There is no appeal as of right to the Judicial Committee of the Privy Council, but the king may on petition grant leave to appeal. The courts have no check on the constitutionality of legislation.

In the light of the history and peculiar difficul-

ties of South Africa it is surprising that the form of government set up was not federal. One of the first acts of the convention was to vote down federalism. Among the variety of individual points of view contributing to this result were unfavorable interpretation of the functioning of federalism in Canada and Australia, a conception of the union as a continuation of the Cape of Good Hope's process of annexation and a feeling that the disunion after the Boer War necessitated heroic measures to secure effective co-operation. Certain concessions to federalism were made, but in all essentials the government is a legislative union. The provinces set up by the South Africa Act, although in geographical boundary and (with one exception) in name identical with the previous colonies, have no legal continuity with them. They can be abolished at any time by the union Parliament; their legislation can be vetoed by the union government and, if in conflict with union acts, is void to the extent of the conflict. They have no exclusive legislative powers. Concurrently with the union Parliament (which in general allows them a free hand within these narrow limits) they may make laws on education, hospitals, agriculture, roads, local government, poor relief, shop hours and a few minor points. Higher education is exclusively a union matter. Financially the provinces are limited to certain direct taxes and assigned revenues and depend upon subsidies from the union government for approximately half their income.

In each province there is a unicameral legislature known as a provincial council, which elects by proportional representation an executive committee of four members sitting, like the council itself, for a fixed period of three years on the Swiss model. An official nominated by the union government for a term of five years and known as administrator presides over this committee and over the province generally. His powers and status resemble those of the French prefect and he combines somewhat incongruously with the very differently formed executive committee. The provincial councils have not been an unqualified success. The attempt to create non-party executive committees has only resulted in transferring the wrangles of the council chamber to the committee room. Widely criticized in every province except Natal, where they are considered a guaranty of the rights of this English speaking province, their early disappearance is nevertheless improbable for various reasons.

Local government was not changed by the act of union. Municipal government, carried on by elective councils, is generally satisfactory; many of the towns provide a wide variety of public services. One of the greatest governmental defects of the union is the lack, except for the divisional councils in the Cape of Good Hope, of an effective system of rural local government. The burden of taxation falls on the towns (which are under-represented in Parliament) and rural communities have not been taught self-help or responsibility.

The internal development of the union has been marked by bitter party feuds and unhealthy symptoms of political patronage. Industrial disputes of an acute character took place in 1913, 1914 and 1922, but since then liberal labor legislation and administration have done much to conciliate European workers. From this legislation the native Bantu worker, who supplies most of the labor of the country, has been generally excluded. The future status of the native is the most important problem of the union. A uniform native franchise of all provinces has been mooted and various types of communal representation have been discussed. Besides objections of principle the chief difficulty toward realizing such schemes is the vested interests of Cape native voters, whose rights are specially entrenched in one of the three rigid clauses of the constitution. The outbreak of the war in 1914 was a crushing disaster for South Africa, arousing great inter-racial bitterness and preventing the early attainment of national unity. A rebellion broke out in parts of the Transvaal and Orange Free State, and a strong Nationalist party grew out of its repression.

The presence of neighboring British territories raised hopes, which have not materialized, for an extension of the union's boundaries. In 1922 Southern Rhodesia definitely rejected entrance into the union; it became a self-governing colony in 1923. Until 1930, the governor general of the union was also high commissioner for Southern Rhodesia and for the native protectorates of Basutoland, Bechuanaland and Swaziland. As a result of the imperial conferences of 1926 and 1930 these two offices have been separated. The governor general is now the personal representative of the king (not the British government) in the union and the formal head of the union government, while the high commissioner in addition to supervising the territories mentioned is also the representative of the government of the United Kingdom in the Union

of South Africa with semi-ambassadorial functions. Customs union arrangements still tie the union to the territories but the renewal of the agreement with Southern Rhodesia in 1930 was consummated with great difficulty. The Appellate Division of the South African Supreme Court has jurisdiction over appeals from the court of Swaziland and the High Court of Southwest Africa as well as from the High Court of Southern Rhodesia, which, like the union, is governed by Roman Dutch law. In 1925 Southwest Africa, which the union administers as a Class C mandate under the League of Nations, was granted a measure of self-government with institutions somewhat similar to those of the provinces; it will probably ultimately be incorporated in the union.

South Africa is a land of dualism. A special South African nationality exists in law within the wider field of British nationality and a special South African flag is recognized side by side with the Union Jack. In addition to Bloemfontein, which is the home of the appeals court, there are two capitals, Cape Town being the seat of the legislature and Pretoria of the administration. Finally, there are two official languages, English and Dutch, the latter term including the South African form of Dutch—Afrikaans—which has almost entirely replaced the Dutch of Holland for state purposes. No feature of its institutions mirrors the history of South Africa more clearly than this dualism.

EDGAR BROOKES

Irish Free State. The "Articles of Agreement for a Treaty between Great Britain and Ireland," drawn up in 1921 after years of civil war and much rancor (see IRISH QUESTION), provided that the new Irish Free State was to have "the same constitutional status in the Community of Nations known as the British Empire as the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand, and the Union of South Africa." The status of Canada was agreed upon as the criterion of the relations of the Free State to the empire. Northern Ireland exercised the right granted it in article XII of the treaty and withdrew from the Free State on December 7, 1922. A constitution, which came into operation December 6, 1922, was drafted by a committee which took the constitution of Great Britain as a basis but instituted important changes drawn from those of the United States, Switzerland and Germany and from their own experience. Many of the

provisions proved quite unworkable under Irish conditions and amendments have been frequent. Constitutional changes have been easily accomplished as a result of the important provision (itself amended so as to extend its operation for an additional eight years) that for eight years amendments could be made by simple legislative act.

All the committee members were suspicious of party government and party organization, an attitude derived from intimate and often painful personal experience in Ireland and the United States with the power of the party boss and the baleful influence which he may come to exercise. They had been subjected to personal abuse and occasionally to maltreatment because of the heterodoxy of their political creed, and they knew that a strong party organization inevitably led to the suppression of independent political thought. They knew also that in its earlier stages the greatest requirement of the Irish Free State was independence of political thought and opinion. Consequently in addition to specific guarantees of freedom of person, conscience and expression the constitution embodied every known device for the subjection of political parties.

The constitution provided for a legislature to be known as the *Oireachtas* and to consist of the king and two houses, the Chamber of Deputies (Dail) and the Senate (*Seanad*). A unicameral legislative system would probably have been adopted had there not been an agreement to provide seats in the upper house for representatives of the old "loyalist" classes; the *Fianna Fail*, or Republican party, aims to abolish the Senate as soon as possible. All citizens over twenty-one years of age, regardless of sex, can vote in Dail elections, and all voters are eligible to membership in the Dail. The legislative term, originally four years, has been limited to six by constitutional amendment and fixed at five by legislation; the Dail may be dissolved on the advice of the Executive Council, and in such a case new elections must be held within thirty days.

The mode of selecting the Executive Council followed rather the example of Switzerland than of Great Britain. The president was to be elected by the Dail; he was then to nominate from five to seven ministers as his Executive Council, to be elected en bloc. Certain extern ministers, not members of the council, were to be elected directly by the Dail on the basis of peculiar fitness for particular posts. The total number of ministers was limited to twelve. In practise this

divided responsibility did not work; an amendment in 1927 therefore increased the maximum number of ministers in the council to twelve, thus making possible the elimination of the extern ministers. As a result all ministers are now members of the Executive Council; each except the president is responsible for an administrative department. By an amendment of 1929, one member of the council may be a senator. The constitution provided for vocational councils to advise the ministers, but aside from a more or less sporadic and unconvincing agitation nothing has been done to call them into being.

The same council, under the presidency of William T. Cosgrave, has been continuously in office from the first. Its supporting party, *Cumann na nGaedhal*, had almost uncontested domination of the Dail during the first five years because of the absence of the *Fianna Fail* members, who were unwilling to take the oath of allegiance required. Only when the oath was made a condition of nomination in 1927 did the followers of De Valera take their seats. When they immediately thereafter attempted to remove the oath through the referendum and the initiative, Cosgrave used his slight governmental majority to eliminate these features from the constitution. In the early years the opposition of the Labour party, under the leadership of Thomas Johnson, aided in crystallizing the legislative processes. Since 1927 De Valera has been leader of the parliamentary opposition, which includes the vast mass of Republican opinion. Party discipline in the Dail is very strong.

While the Dail has undergone only the process of party solidification so abhorrent to the spirit of the original constitution, the Senate has been radically altered. It consists of persons who have "done honour to the nation by reason of useful public service" or who represent important aspects of the nation's life. There were temporary provisions for the constitution of the first Senate; every three years thereafter one fourth of the seats were to be vacated, and the eligible voters (those over thirty years) were to elect the new members from a panel prepared by the Dail and the Senate. One election was held under this system, in 1925; it was boycotted by *Fianna Fail*, only about one fourth of those qualified voted and the system was generally adjudged undesirable. In 1928 the constitution was amended to reduce the Senate term from twelve to nine years, one third of the members retiring every three years; the age limit for eligibility was reduced from thirty-five to thirty,

years; and the full power of election was given to the two houses voting together under a system of proportional representation, an arrangement which has brought the party system into the Senate as well as the Dail. The length of time for which the Senate may postpone the operation of an act passed by the Dail was extended from nine to eighteen months, with a possible additional two months if the Dail re-passes the same measure.

The single transferable vote system of proportional representation was provided for in the constitution. While most people profess to be satisfied with its continuance there are demands for a change, principally to the alternative vote system with smaller constituencies. It is agreed that proportional representation carried the new state safely through a civil war and much political disturbance, but it is argued that under stabilized conditions the system is unduly ponderous for a small state.

The judicial system of the old British regime has been completely displaced by a system of courts which is still in its experimental stages. At its head as a court of final appeal is the Supreme Court, while a High Court, circuit courts and district courts are provided as courts of first instance. The Supreme Court and the High Court are given express power to pass on the constitutionality of laws. Constitutionally there is still a right of appeal to the Privy Council, but this right has proved futile in practise. The judicial system works well on the whole, but there is serious discontent at the delays in procedure.

The entire system of internal administration has been radically altered toward greater centralization. Of the older British system of local government only the county councils remain. The small rural district councils, the boards of guardians and many other petty local authorities have been abolished and their functions transferred to the county councils under the direction of the Ministry of Local Government and Public Health. In the larger cities city managers acting with an elected advisory council have been appointed as chief executives. This system will be adopted for the county councils in the very near future. Another departure is the system of state ownership with delegated control of public utility service, such as the Electricity Supply Board operating the Shannon hydro-electric scheme; this has been adapted to such services as fisheries and home industries through a system of state control with commercial management.

Because of the backward industrial state of the

country and the absence of industrial initiative and confidence the initiative in nearly every industrial advance has had to be taken by the government. In addition to actual ownership of certain projects the state has granted subsidies to the beet sugar industry and has provided loans for agriculture and industry. A permanent Tariff Commission, set up to pass upon applications for tariffs, has granted nearly every application. The land problem has been the subject of a series of acts since 1923 the effect of which has been to break up more and more of the large estates. The 1931 act is calculated finally to solve the problem. In the interest of economy the government has been backward in the provision of social services. That the public finances have been rather well handled is indicated by the fact that during the wave of financial difficulties which overtook country after country in 1931 the credit of the Irish Free State stood very high.

While the Free State is not yet a properly functioning democracy, there is every indication that it soon will be. Except for the early years of internal conflict and for such restrictions as are due to the continued existence of armed revolutionary organizations, civil liberties have been consistently maintained. Political interest is evidenced by the fact that over 75 percent of the electorate generally votes in elections. The educational system has been remodeled and the press is active. While the censorship of films and books may assume serious political significance at any moment, its present aim is moral rather than political. The influence of the Catholic church is strong and will probably increase with the passage of time.

ANDREW E. MALONE

See: LEGISLATIVE ASSEMBLIES; PARTIES, POLITICAL; DOMINION STATUS; COLONIES; COLONIAL ECONOMIC POLICY.

British Commonwealth of Nations. The British Commonwealth of Nations is the term, now sanctioned by many official acts, used to describe the metamorphosis of the old imperial relations between Britain and her dominions into a new constitutional structure based upon equality of legal status. In official usage it is interchangeable with British Empire, but it is applied only to the relations of the United Kingdom and its dependencies with the six fully autonomous dominions in which equality of status is admitted. Even here Newfoundland has not been admitted by other powers to an international parity with

the other dominions—Canada, Australia, New Zealand, the Union of South Africa and the Irish Free State—since it has not been admitted to membership in the League of Nations. On the other hand, even though India by an international anomaly occupies a seat in the League Assembly as an original signatory of the Treaty of Versailles it is not a full member of the commonwealth and appears at imperial conferences by grace. Although promised eventual dominion status it is still legally and in fact subordinate to the will of the British Parliament.

The Act of 1649 created the first British Commonwealth—without a crown. In the modern British Commonwealth of Nations the crown is almost the sole bond of unity. This revival of the term commonwealth owes its adoption to the school of imperial statesmanship that produced the term diarchy to describe the rule over the provinces in India. It is an effort thoroughly Platonic to create a state of fact by a myth—through the power of a word; or, viewed from another angle, to disguise an existing state of fact by calling it something quite different. Lionel Curtis and the Round Table disciples of imperial federation had attempted to create a true commonwealth that could tax its federal members and legislate on defense and high policy through a federal (imperial) legislature. Although federation failed to come about even under the welding influence of wartime sentiment, the term commonwealth was nevertheless adopted. It was given wide popular sanction by the speeches of British and of dominion ministers, particularly General Smuts, during the imperial war conferences in the last two years of the war. Its first really official use was in the oath of allegiance included in the so-called Anglo-Irish Treaty of 1921 and given legislative currency by the Irish Free State Constitution Act of 1922. The treaty itself also spoke of the "Community of Nations known as the British Empire."

The expression British Empire continued to be used even in the League of Nations for official purposes and the expression British Commonwealth of Nations enjoyed only a propagandist usage until after the Imperial Conference of 1926. The Balfour Report of 1926, as the famous formula on equality of status came to be known, was a model of reconciling through a happy formula unity with diversity and equality of status with the functional hegemony of the mother country. But it merely recognized facts; the remaining legal and diplomatic unity of the empire depended on dominion cooperation.

Indeed, by persuading the dominions to accept a formula of signature in which the king stood as the sole high contracting party under the Heads of States formula, the British negotiators at this conference succeeded in suppressing for the time internal difficulties which had been raised at Geneva and elsewhere by the Irish Free State over the *inter se* application of treaties and multilateral conventions. Since the king's name was used to group all the signatures for the dominions and Great Britain as well as India, the international practise indicated that the great seal appeared on the final authority of the king as the head of a single state—the British Empire. However, whereas the United Kingdom of Great Britain and (since 1922) Northern Ireland had previously been represented by the signature of a plenipotentiary who signed for the British Empire as a whole, exempting from the binding force of his signature all those territorial units that were separate members of the League or such colonies as desired to be left out, under the new form of signature the United Kingdom appeared as a unit of the British Empire along with the dominions, *primus inter pares*. From 1927 onward the powers issued to the plenipotentiary for the United Kingdom no longer included the dominions, although they did include the dependent empire with the exception of India.

The separate international personality of the dominions may be said to have been recognized by other states to the degree that ministers plenipotentiary have been exchanged with all but Australia and New Zealand by one or more of the most important foreign powers, including the United States. There is at least one dominion minister in the capital of each first rate power except Russia. The Irish Free State has even been granted a special seal by the king himself to be applied to all international documents in place of the great seal of the United Kingdom. There is therefore apparently nothing left to prevent separate international action by any dominion except a constitutional understanding really of international character. This entente is limited to maintaining "consultation" on matters of common interest and a common person as the bearer of the crown, which is responsibly and separately advised by the ministers of every member of the commonwealth through a governor general, who is now purely viceregal in his capacities and subject to actual choice by the dominion concerned. The use of British diplomatic channels is left available to the dominions,

and the primary category of citizenship in the British Commonwealth of Nations, through agreement on basic laws and allegiance to a common king, is retained.

The Imperial Conference of 1930, accepting the report of the Conference on the Operation of Dominion Legislation of 1929 and recommending the Statute of Westminster, gave a legal basis to equality of status (*see* DOMINION STATUS). The royal signature to this statute in December, 1931, removed all the bars to a dominion's changing any imperial law. Although the preamble contains an agreement that "any alteration in the laws touching the Succession to the Throne or the Royal Style and Titles shall hereafter require the assent as well of the Parliaments of all the Dominions as of the Parliament of the United Kingdom," it has no enacting force of its own and is merely a statement of international agreement in the light of the rest of the document. In strict law perhaps the right of disallowance and reservation still remains and is admitted for any dominion act which in the judgment of the British Treasury violates the terms of the Colonial Stock Act of 1900. But this right as well as much of the right of appeal which still remains to the Judicial Committee of the Privy Council might be presumably altered by any dominion except in so far as its constitution prevented it. And after agreement by the proper dominion authorities these constitutions might themselves be altered. The limiting of dominion legislative competence to their own territories and to conformity with British acts (through the Colonial Laws Validity Act of 1865) disappeared along with the limitations under the Colonial Courts of Admiralty Act of 1890 and the Merchant Shipping Act of 1894.

It must be admitted by those who claim that the Statute of Westminster and the Irish Free State's seal taken together complete the juristic conditions of a personal union foreseen by J. S. Ewart of Canada that the vestigial control over the constitutional acts of the federal dominions and New Zealand by the Parliament of the United Kingdom still constitutes a formal bar to complete independence of dominion action. And if constitutional understandings are held to render this of no effect, then constitutional understandings at the same time still preserve some aspects of a confederation for the commonwealth. For instance, the laws governing the throne require unanimous consent to change; meanwhile they remain British laws. Similarly there has so far been constitutional

agreement to retain a common basis of imperial citizenship which extends further than even the old doctrines of allegiance would have pushed such community under a personal union [*see* Calvin's Case, 7 Rep. 1 (1608), and *Isaacson v. Durant*, 17 Q.B.D. 54 (1886)]. British treaties so far cover all British subjects in the advantages which are claimed, although there is a growing tendency for foreign states to dispute this blanket clause and the application of the adjective British to all dominion shipping.

International usage also indicates that the British Commonwealth of Nations has not yet achieved the complete recognition of the separate state personality of the dominions that is accorded to independent states. It has been acknowledged that the dominions are entitled to seats on the Council of the League of Nations and to the election of their nationals as judges to separate seats on the Permanent Court of International Justice. Canada and the Irish Free State have sat upon the Council, but no dominion has yet had one of its nationals upon the World Court. Indeed the Committee of Jurists engaged in revising the Statute of the Court in 1929 seemed almost unanimously opposed to or suspicious of the claim advanced by Sir Cecil Hurst that in cases where they were parties at interest to a dispute the dominions have the right to have separate dominion judges added to the Court even if a British judge is sitting. A more convincing evidence that foreign powers do not yet concede independent state personality to the dominions on the personal union basis appears in naval conferences. The dominion delegates succeeded in the London Naval Conference of 1930 in being treated as the heads of delegations. But the British Commonwealth of Nations—so termed in the resultant treaty—must accept a quota as a single unit, as if it were only one state.

A confederate character of indivisible statehood inheres in the privileges claimed by the members of the commonwealth to extend mutual tariff preferences *inter se* without violation of the most-favored-nation clauses of commercial treaties. The *inter se* exemption from the operation of such international conventions as those on copyright, customs formalities and transit are still claimed under the shelter of the indivisible character of the crown *vis-à-vis* foreign states. No doubt the *inter se* reservation attached to the signature of the optional clause of the World Court's Statute and to the General Act of 1930 is primarily of constitutional concern only to the members of the British Com-

monwealth. Yet it does indicate a peculiar relationship which has international significance. The refusal of the Irish Free State to insert the reservation is probably in its immediate bearing of only academic interest to foreign states. But it raises the logical issue of whether a full member of the League of Nations can or should stand in a juristic relation to a group of other states which might prevent independent action.

So long as consultation on matters of high policy results in a degree of unanimity, of which the only serious breach so far is the main Locarno Pact, foreign powers are justified in regarding the potential neutrality of the dominions as a strategic rather than a juristic possibility. If defense forces are freely exchanged and naval bases open to the British fleet are maintained in the dominions, their freedom from attack would depend on sufferance rather than on right. Only General Hertzog has claimed neutrality for a dominion in any official pronouncement. And he has not been willing to face the question of what the status of the British admiral in South Africa would be. Probably neutrality would involve a formal right of secession—also claimed by the general but merely “noted” by the last Imperial Conference.

Although in these various respects the commonwealth remains a confederation of states rather than a league of states under a personal union, the inherent political power to treat the crown as a divisible body no doubt exists in the dominions. They might treat it as a crown acting as separately for their separate kingdoms as once it did for Scotland and England (to 1707) or for Great Britain and Hanover up to the accession of a female ruler of England, Victoria.

The present organization of the commonwealth therefore continues to defy exact juristic classification, even though all tendencies point to the completion of the personal union status with a purely symbolic crown, which permits and encourages consultation with a view to joint action but which does not enforce legal unity. The sanctions against a violation of this constitutional unity, which depends upon the use of the Imperial Conference to secure unanimous agreement and joint legislative activity, are now almost wholly extralegal and could be made entirely so if any dominion persistently desired it.

But the bonds of empire even on this basis are by no means so tenuous as their legal statement would seem to imply. Only the Union of South Africa was able in 1931 to remain on the gold standard after the British relapse in September.

Even on a dominion in the strong economic position of the union with its gold exports the pressure has been increasingly heavy to follow Britain in order that South African producers should not be competitively penalized in shipping into their best market—the British. The banking structure of all the dominions except Canada is intimately connected with that of Great Britain. Ireland is an economic adjunct of England in every sense. Only Canada is substantially outside the British market's orbit. And if the tariff antagonism between the United States and Canada continues, even Canada despite the overwhelming preponderance of American capital invested in its industries may be forced increasingly back within the imperial system.

Except for Canada's steps toward an economic rapprochement with the West Indies the dominions are as yet uninterested in the dependent empire either as a market or as a source of raw materials. They rely upon England mainly as a steady market for their commodities under increasing tariff preferences in 1932 generalized by Britain's 10 percent basic tariff; and as a stabilizing influence in a world in which large scale wars are all too possible. British emigration to the dominions still more than the shipment of British goods has been brought to a standstill by the growth of dominion nationalism. Allowing for the abnormal character of the depression, this development is a marked feature of the post-war period. Cultural attachments of certain types in education and literature flourish, but even here nationalism plays a limiting role.

It is to the organization of a type of machinery like that of the League of Nations, but infused with more intimate sentiments, that Britain must look for the future of imperial cooperation. The machinery of direct consultation or of periodic conferences for all sorts of expert as well as political purposes has so far proved to be more feasible in securing cooperation than has the erection of any sort of secretariat or permanent advisory body in London. It is true that the dominions maintain high commissioners in London, but their functions are primarily economic and ceremonial and not constitutional or even really diplomatic. On important matters the governments consult directly or through visiting cabinet ministers. The experiment of cabinet ministers resident in London undertaken just before and during the war by Canada and by New Zealand has hardly afforded hopeful results. Liaison officers, like the Australian official who cooperates with the Imperial Defence Com-

mittee and the cabinet secretariat, may be increasingly employed.

Although the meetings of imperial forestry, metallurgical, surveying and similar conferences in London and occasionally in the dominions seem to produce more propaganda than concrete cooperation they are nevertheless both useful and necessary. The few imperial bodies on which the dominions are equally and permanently represented do not as yet have very important functions. The Imperial Economic Committee and the Imperial Shipping Committee have been mainly useful in intelligence work and scientific surveys. The Empire Marketing Board has been dependent on the secretary of state for dominion affairs and on the British Parliament for its funds and in the main for its guidance. At the Imperial Conference of 1930 its control was turned over to a trust and its funds guaranteed for a period, but these funds were ruthlessly slashed in the 1931 British economy program.

Uniform legislation to implement what amount to international conventions goes somewhat further in the British Commonwealth of Nations than in general international treaties. Laws on nationality are thus arrived at after conferences. The 1930 conference adopted a draft agreement on merchant shipping which it was hoped that the dominions might accept and carry into effect. The Statute of Westminster is to be passed by three dominions—Australia, New Zealand and Newfoundland—before it becomes operative for their laws. Although the way is left open for the use of legislation from Westminster, to apply to the dominions only at their own request, the form of concurrent legislation will no doubt be more usual as being more in conformity with the dignity of the dominions. In strict legal theory no Parliament of Westminster can bind its successors: the Statute of Westminster might therefore be repealed. But this is pushing theory into the realm of palpable fiction.

The constituent organ of the commonwealth, the Imperial Conference, has so far shown more ability to achieve constitutional changes than has the Council of the League of Nations. But it has done so only because it constantly tended to strip the central government at London of imperial powers. Whether it will be equally effective for construction of new ties or organs of the commonwealth still remains to be seen. Certainly the embryonic organs of an imperial secretariat in London are not yet as articulated or as useful as are those of the League. Perhaps

in the improbable event of any sweeping degree of success for the movement toward closer economic union within the empire these imperial organs of a permanent secretariat might develop. Any common tariff or currency policy would create a need for them.

The colonial conference and the colonial empire are the responsibility of England alone and do not concern the dominions. The colonial secretary is now separate from the secretary of state for dominion affairs, as their permanent civil service staffs have been formally since 1925 and in fact since about 1910. The Dominions Office itself is a purely British department, although like the Foreign Office and the British consular and diplomatic service it is at the disposal of all the dominions for consultation and other services.

It has as yet proved no more possible to organize a central imperial court of judicature than a secretariat or a representative federal council of a permanent character. The Judicial Committee of the Privy Council retains some powers of hearing appeals from the dominions. It includes a few dominion judges, who attend irregularly, but they are appointed from England. Its popularity as a court of final appeal from the dominions has never been great, and it is as at present constituted an anomaly from the constitutional point of view. The Irish Free State has taken the extreme position of practically nullifying the few appeals which the Judicial Committee has allowed from the Free State under the Treaty of 1921 and the Constitution Act of 1922, section 66. Its announced intention to abolish the right of appeal after the passage of the Statute of Westminster is held in abeyance by negotiations to secure first a modification of the Treaty of 1921, a procedure on which the British government seems to have insisted. The government of the Union of South Africa seems similarly antagonistic to the Judicial Committee and the other dominions are restive.

Special ad hoc arbitral tribunals, chosen in the usual manner but from within the British Commonwealth, have been proposed by the report of the Imperial Conference of 1930 to hear justiciable disputes between the governments. It is significant that recourse was rather to arbitration tribunals than to a type of court analogous to the Permanent Court of International Justice or even that of Arbitration, with its permanent panels. It is also noteworthy perhaps that for the first time in an official document sanctioned by the British government the members of the

commonwealth are spoken of in this connection in the Imperial Conference Report of 1930 as "*States members . . .*" (author's italics).

The significance of the British Commonwealth of Nations for political theory is highly disputable. Traditionalists will see in its juristic evolution the working out of the logic of national sovereignty to the ultimate conclusion of independent statehood for the dominions. Pluralists will point to the indeterminate character of its present unity as an illustration of the victory of factual complexity over juristic categories. Proponents of an international order based on a voluntary and contractual but workable regime of international law will see in it the model of a new legal order. Even believers in a world super-state will probably regard its existence as prophetic of the retention of unity in the face of nationalism.

Because of its juristic anomalies it may be made to serve all these theoretical causes. But if political theory be an attempt to understand facts and to derive from them both scientific descriptions of a present order and a clue to ideal tendencies, the British Commonwealth of Nations must be presented as an order of fact that is indeed *sui generis*, since its members have succeeded so far in having the best of two possible worlds: the status of independent contracting parties for privileges and exemptions or the status of parts of a single international unit—whichever is the more useful at the moment. From the point of view of other states this may eventually present objections. At present its convenience in stabilizing international peace is stronger than any harm it does to international practise through conflict with traditional juristic concepts.

Nevertheless, it must be admitted that the existence of a permanent or apparently permanent constitutional basis of legal uniformity on certain matters raises for juristic theory in a more acute form the problem presented by the League of Nations and other international legal and political machinery. Granted that the dominions in fact now judge the limits of their own commitments and responsibility in international matters, does not the degree of unity remaining in the commonwealth force from the classic theory of sovereignty the admission that an area of uniformly observed and enforceable law so binding in its character as to restrain legislatures to its observance may transcend the boundaries of nationalism and create an international legal order as effective in controlling conduct as con-

stitutional law within the state? Where does self-limitation by the state end and reciprocal limitation by a total world context begin?

To the hardened Austinian the answer will be, "Where self-interest lays down the ultimate limits of national advantage and survival." But the answer to this, in turn, may be that precisely those factors dictate the continuance of the community of nations called the British Commonwealth in its present hybrid form. May these same forces not cause a reorientation generally of political theory, if suicidal national egotism does not destroy the whole structure of international controls?

FRANCE. The essential organs performing the functions of the government of France are the Chamber of Deputies, a body of popular representatives, which is in fact all powerful, and the civil service, subordinated to the former. These two features characterize the French government and account for the differences which despite superficial similarities exist between it and the British or the American government.

The tradition of highly centralized administration is firmly rooted in the history of the French people, on whom the Latin political genius left a deep impress during the four centuries of Roman rule in the province of Gaul. Submerged in the early stages of the feudal period, the Roman ideas of imperium and *auctoritas*, of a central government guarding the peace by a policy of intervention and authoritarianism, were revived by the crown when it became the bulwark of the common people against the lords. The French people willingly exchanged their whole hearted allegiance for assurance of internal order and defense against external aggression. During eight centuries with their support the kings continued to extend their territorial boundaries to the limits of present day France, encountering ever decreasing opposition as they successively transformed their realm from a feudal state (987-1461) into a limited monarchy (1461-1610) and finally into an absolute monarchy (1610-1789).

When the *ancien régime* broke down in 1789, the various elements in the nation although united were, however, still unsubordinated to a common law. The highly centralized and actively functioning administrative system revealed wide discrepancies in different localities. All statutes,

taxes, justice, administrative regulations, varied according to social class and economic status. Basically it was a system of privilege controlled by the king, who was himself the head of the privileged hierarchy, with the aid of the privileged classes and corporations. Nor did any class whatever its position in the social scale enjoy a modicum of freedom. In the absence of a procedure like habeas corpus guaranteeing personal freedom and of even the embryonic traces of such freedom of speech and of the press as were to become sacred in England with the passage of Fox' Libel Act of 1792 all alike were dependent upon the wisdom, the justice and the mercy of the sovereign and his agents.

By 1789 the bourgeoisie grown numerous and wealthy could no longer tolerate a regime which condemned them to inequality at the same time that it permitted them no more significant political role than passive acquiescence. The result of their disaffection was the French Revolution and the transference of legal sovereignty by the Declaration of the Rights of Man and the Citizen of 1789 and by the constitution of 1791 from the king to the nation. But the revolutionary assemblies failed completely to launch a permanent constitutional government. Having no knowledge of the rules of political debate they allowed themselves to become embroiled in factional disputes or succumbed passively to the tide which swept France in ten years from a constitutional monarchy (1789-92) to the revolutionary government of the National Convention (1792-95), thence to the constitutional republic of the directorate (1795-99) and finally to the quest for authority and order culminating in the establishment of the Napoleonic consulate and empire. The liberty temporarily achieved by the revolution was extinguished by Napoleon; nevertheless, the important concrete gains of its assemblies, such as the abolition of inequalities before the law and the complete revision of private law, owed to him their consolidation and perpetuation. Napoleon reorganized the administrative system, completing the work of the kings of the *ancien régime*. Symmetrical, uniform, centralized in the extreme, the system he established assured the expeditious enforcement of all laws in the remotest regions of the country. The division into local units, of which the most important are the department and the commune, all provided with identical machinery and guarded by the principal local officer, the prefect, who is the head of the department acting at once as the agent of the central government

which appoints him and as the chief administrator, is still in force today. Occasional outcries for decentralization or deconcentration in the nineteenth and twentieth centuries have resulted in relatively slight modifications.

The question of what authority was to create the laws thus to be administered occupied Frenchmen for sixty years after the fall of Napoleon in 1815. Joining in the struggles were the proponents of two conflicting currents of ideas: those who desired an authoritarian government in the hands of a sovereign open to discreet advice from representative assemblies of limited power and those who advocated government by opinion through the medium of powerful assemblies and resting on a foundation of extensive political liberties. An invitation to the frequent seizure of power by a new group was extended by the centralized nature of the administrative system. The slightest blow aimed at its head could paralyze the whole system. Whatever contingency subjected the ministers in Paris to a new master simultaneously made that person master of the whole nation. On the other hand, few of the governmental changes in nineteenth century France deserve the title of revolution. None of them touched the social and administrative institutions; they involved a simple transfer of authority from one individual, dynasty or class to another while the nation looked on passively, more predisposed to obey than to protect its liberty. Between 1815 and 1830 the Bourbons and the aristocracy attempted to revive the monarchy founded on divine right; from 1830 to 1848 Louis Philippe and the bourgeoisie maintained a constitutional monarchy; between 1848 and 1851 the democrats tried their luck, yielding to Napoleon III, who for the next nineteen years tried his. In the end the only profit from these transient experiments was won by the nation, which received a political education. From 1815 to 1848 it was initiated into the practices of parliamentary government. By instituting popular election of members of the municipal councils in 1831 and of the councils of the *arrondissements* and of the departments in 1833, the July Monarchy taught the people to take part in local government. Universal suffrage was introduced by the republic of 1848. When the government of Napoleon III, originally founded on authoritarian principles, developed without the application of violent external pressure into the liberal empire, which lasted from 1867 to 1870, it indicated the true direction in which the French nation was moving.

The Franco-Prussian War and the collapse of the empire in 1870 marked the decisive turning point. For the first time in fifty-six years a political crisis found no individual or dynasty appearing to take over the government and begin a new experiment. The desperate condition of France frightened the aspirants for power and the field was left clear for the slow, deliberate working out of a permanent form of government. This task was performed by the National Assembly of 1871-75. The majority in the Assembly were royalist, but because they were divided into Legitimists, supporting the elder branch of the house of Bourbon, and Orleanists, whose allegiance belonged to the younger, they were unable to concert in establishing a monarchy, although they made such an attempt in 1873. In this deadlock the Republican minority, gradually strengthened through by-elections, was able to secure the adoption of a series of constitutional laws which except for slight modifications are in force today.

These laws, three in number, were passed on February 24, February 25 and July 16, 1875, and deal respectively with the organization of the Senate, with that of the public powers and with the relations between the public powers. In striking contrast to the elaborate texts of earlier French constitutions the laws which have acquired the name of the constitution of 1875 are extremely brief; only essential points are explicitly treated, the rest being ignored or vaguely implied. The difference may be explained by the fact that the constitution of 1875 was a compromise between radically differing factions. They agreed to establish a parliamentary republic with the legislative function vested in two assemblies and the executive in a president. As a concession to the republican group the Chamber of Deputies, or lower house, was elected popularly. The royalists obtained in compensation an upper house, the Senate, and a president whose nature and attributes they expected would permit an easy transition to a monarchical form of government. The president was to be elected by the Chamber and the Senate convened in joint session as a National Assembly, or congress, for a term of seven years; since seven years allowed ample time for the appearance of a royalist majority in both houses, the National Assembly might then, before a presidential tradition had been established, create a throne for the prince of its choice. This prince would find legal sanction for all the prerogatives of a monarch in the constitution, for according to the compromise

of 1875 the executive was endowed with the right to initiate legislation, to grant pardons, to fix the length of the period during which the legislature should sit, to suspend it during sessions and to dissolve the Chamber of Deputies with the consent of the Senate. There was no doubt in the minds of the royalists that the Senate would support the monarch. They had carefully designed an upper house which would necessarily be a stronghold of the Right. Out of the three hundred senators 225 were to be elected for nine years by a special electoral college in each department, consisting of the deputies for that department, the members of the General Council of the department and of the councils of the *arrondissements* and of a delegate from each municipal council. In this college the small communes and the rural element, traditionally conservative, would have a preponderant influence. The other seventy-five senators were to be chosen for life by their colleagues.

The factor with which the royalists failed to reckon was the strength of the lower house and the prestige it might acquire. In actual fact it is the Chamber of Deputies which has had the guiding hand in the development of the present form of the French government. The Chamber is elected for four years by universal manhood suffrage, the electoral procedure having vacillated between the *scrutin de liste*, according to which each party presents to the voter a list of candidates for the whole department, and the *scrutin uninominal*, or *d'arrondissement*, with the elector voting for a single deputy. Except in rare instances public opinion since 1875 has manifested a continuous trend toward the left and under its aegis the Chamber has progressively developed its power at the expense of the other governmental branches. Scarcely two years after the establishment of the constitution President MacMahon put the presidential prerogative to the test by dismissing the premier and subsequently dissolving the Chamber. These events, centering about the so-called crisis of May 16, 1877, had important consequences. When the nation in the ensuing election of deputies returned a republican majority, which withheld supplies until the reactionary ministry was dismissed, the presidency suffered a permanent blow and subsided into what it has since remained, at least ostensibly—the office of the recognized representative of the French nation. The direction of policies and executive responsibility passed to the premier and the cabinet, whose existence had been only vaguely implied

in the constitution by such indirect references as the provision that "the ministers are collectively responsible to the chambers." But substantial and final power devolved upon the Chamber. Since the crisis of 1877 the Chamber has been assured of surviving for the full extent of its four-year term. Secure from the menace of dissolution by either president or minister, it holds the fate of the government in its own hands, for the principle has become firmly established that the cabinet must retire on a hostile vote of the Chamber but not of the Senate. Since the multiple party system prevails in France and division is into numerous groups representing a wide variety of subtle or finely shaded difference, the average life of French cabinets has been short. The cabinet is composed of political leaders recruited from a number of groups which have united for the time being to form a majority; it can last only so long as its program or actions retain the support of this none too reliable majority. It is the strategy of the opposition to use the procedure known as interpellation, which has so often proved fatal to cabinets; a debate is precipitated on a question upon which the groups in the majority cannot possibly agree. Too much significance should not, however, be attached to the instability of the French ministerial system. The cabinets following each other in this rapid succession reveal strong points of similarity; all of them depend upon approximately the same majority. There is indisputable continuity in the parliamentary history of the Third Republic, and "upsets" in policy have been less frequent in France than in other nations.

Thus the fragmentary and ambiguous constitution of 1875 has served as a practical instrument. Its most profound deviation from original intention, the arrogation of preponderant power by the Chamber, occurred as a simple matter of evolution and adaptation, necessitating no change in the constitution itself. Textual alterations have been made only in matters of detail; the most important of these was effected in 1884 when life members were eliminated from the Senate and the constituency of the electoral college choosing the senator was modified to give the municipalities a representation proportional to their importance. One of the notable lacunae of the constitution of 1875 was the definition of civil liberties, and some contention has arisen particularly with regard to freedom of association. By degrees, however, freedom of assembly, of the press and finally of association has been

recognized, although even today the personal liberty of the citizen is not safeguarded by a specific and definitive statute.

The civil service is divided into a central service at Paris and a local service in each department working under the direction of the prefect. Each branch of the central service is connected with a definite ministry and functions under the supervision of the cabinet member at the head of the ministry. The *fonctionnaires*, as the employees of the civil service are called, are recruited through competition, enjoy the advantage of stable positions and are entitled to a pension on retirement. As yet, however, no comprehensive law has been passed to define their general status. The unions which they have frequently formed sometimes engage in bitter disputes with the supreme authority, thus weakening the old traditions of corporate discipline.

The counterpoise against *la tutelle administrative* and the centralized nature of the French government is to be found in the minute segmentation of public opinion apparent in the Chamber. What formal changes have been introduced since 1871 into the uniform, symmetrical administrative system inherited from Napoleon have been on the whole illusory. But through the medium of the Chamber the spirit and interests of the localities have become a vital influence upon the policy of the central government. A close bond exists between the department and its deputy. Members of the Chamber as a rule sit in at least one local council of their constituency and often in many. As a result of this constant contact the deputy in Paris unless he belongs to one of the extreme factions is seldom inclined to sacrifice local interests to the demands of a party group, particularly in view of the ease with which he can transfer from one group to another or at any moment vote against an impatiently tolerated leader. The narrow margin by which the ministry usually retains its power gives the deputies an opportunity to act as a check upon the prefects, who in their turn depend upon the ministry for retention in office. It has been said that the real heir of Napoleon is not the prefect but the deputy. Thus the old framework of administration has become an instrument commodiously adapted to the political ideas and forms of the Third Republic at the same time that it satisfies the French love of tradition and preserves the harmony between the government and the inveterate predilection of the nation for order, equality and moderation. The administrative courts, the *conseils de préfec-*

ture and the Conseil d'État (*q.v.*) keep constant watch over both the prerogatives of the state and the rights of the citizen and provide a valuable safeguard against possible excess.

BELGIUM. Although the provinces of the Pays-Bas which comprise present day Belgium became united as an independent state only in 1830, the political traditions of the nation had their inception in the Middle Ages. While the feudal system was still firmly implanted in neighboring lands, the region developed into a flourishing center of economic, intellectual and artistic activity. It had rich soil and an intelligent, industrious population; but its most striking advantages were its location at the crossroads of the commercial routes of western Europe and its easily navigable rivers, which provided a natural corridor for trade. Then as now the population was divided linguistically into two elements, the Flemish, speaking a Germanic tongue, closely akin at the present time to Dutch, and the Walloons, a French speaking people. In a stimulating competition each of these elements established powerful and before long wealthy local guilds and associations for advancing their interests. Great towns like Ghent, Bruges, Ypres, Liège and Louvain sprang up in all of the nine districts which are roughly coterminous with the nine provinces of modern Belgium. From the twelfth century onward the burghers of these towns frequently found themselves in a position to curb the power of the feudal lords. Thus there grew up a tradition of local autonomy which retained its vitality throughout the vicissitudes of the coming centuries. In the late Middle Ages the house of Burgundy gained feudal suzerainty over most of the region as the result of a series of inheritances; the Spanish Hapsburgs controlled it from 1555 until 1713; Austria governed it as the Austrian Netherlands from the Treaty of Utrecht until 1795. The spirit of the towns survived these regimes and remained strong enough to withstand the more insidious influence of French domination from 1795 to 1815, although during this period the Napoleonic regime left an indelible impress upon the public and private law, the administrative and judicial systems, of the future Belgian state. During the union with Holland from 1815 to 1830 the urge toward local

autonomy gathered fresh strength as a reaction against the irksome Dutch hegemony.

In 1830 the Belgians revolted against Holland and the following year promulgated, through a National Congress summoned for the purpose, the constitution which is in effect today. The constitution consecrated tradition by establishing a delicate balance between the central and local authorities. In its clear provisions for civil liberties also there may be traced a connection with the charters of the mediaeval communes; but more immediately perhaps these provisions were derived from the stock of ideas bequeathed by the French Revolution. The Belgian constitution was drawn up in the atmosphere of liberalism permeating Europe in 1830. Like the revolution which preceded it, it was created through an alliance of the Catholics with a liberal group whose effective influence was assured because the Catholics needed its support to win freedom from Protestant Holland. Since English parliamentary institutions were during this period at the height of their vogue among continental liberals, it was natural that the Congress should seek to import them into Belgium; for such a move they had before their eyes the recent example of the French Charter. A hereditary monarchy was established with the house of Saxe-Coburg and Gotha, still regnant today, occupying the throne. But in fact by the machinery which it created for parliamentary responsibility the constitution made the king only the nominal head of the state and entrusted executive authority as well as the direction of policies to the cabinet, which was to be answerable to the legislative body, consisting of the Senate and the Chamber of Representatives.

Since its establishment the Belgian constitution has been revised twice, the first time in 1893 under pressure of the rising socialist faction, the second time in 1921 following the World War. The chief changes have concerned the composition of the Senate and the question of suffrage and mode of election. It is chiefly with regard to the latter question that Belgium has demonstrated the capacity for political innovation which has won her the title of the "land of experiments." In 1893, after having maintained a rigorously limited suffrage since 1830, it adopted universal suffrage for men over twenty-five, with a system of plural voting for propertied, educated and certain other classes, and made the exercise of the electoral right compulsory; in 1899 it introduced proportional representation; in 1921 it established universal suffrage, with-

out plurality, for all men over twenty-one and extended the vote to women for all local elections and to certain defined classes of women in national elections. In accordance with the amendment of 1921, the Senate consists of three classes, which as listed in descending numerical importance are those elected by direct popular vote from candidates qualifying in one of twenty-one "categories of capacity," those chosen by the provincial councils and those coopted. The members of the Chamber of Representatives are elected directly by the whole national electoral body. Both houses sit for four years unless earlier dissolved.

Actual supremacy rests with the Chamber of Representatives. The crown while at times exercising great personal influence has abstained from overt interference and never exercises its power of veto. The Senate has as a rule passively accepted the role of a subordinate house, although its constitutional powers are virtually equal to those of the Chamber. At present the complex pattern of its composition on the one hand prevents serious disagreement between the two houses, since three fifths of the senators are elected on the same occasion by approximately the same voters as the representatives, and on the other enables the Senate to perfect the details of bills by considering them in the light of superior technical knowledge and experience. The latter is the particular function of the coopted senators, among whom have been included many eminent individuals. Since 1857 the tradition has been firmly fixed that the cabinet is responsible only to the Chamber and not to the Senate. Although the Belgian parliamentary system differs from the French in that the Chamber is subject to dissolution by the executive, the cabinet is nevertheless kept in hand by the constant danger of being itself overturned. The system of proportional representation has tended to give each party a relatively constant strength in successive chambers; and since the adoption of universal suffrage the safe preponderance of the Catholic party has been replaced by a distribution of the three parties, Catholic, Liberal and Socialist, which necessitates a none too stable coalition to form a government. Another disrupting factor is the mutual antipathy which still manifests itself in the Chamber between the Flemish and the Walloons. As in France and because of a similar faith in the doctrine of the separation of powers the supremacy of the Chamber is further augmented by the lack of judicial review for legislative acts.

The National Congress of 1830 included local government as a fourth power comparable to the legislative, executive and judicial branches and provided for the "attribution to the provincial and communal councils of all that is of provincial or communal interest." The power of the provincial government is in fact not extensive. Its legislative body, the provincial council, which is popularly elected every four years, has slight actual jurisdiction, and its activities are further curtailed by the right of the king to annul any act not conformable to the general welfare. A governor, appointed by the king and directly responsible to the minister of the interior, acts, like the French prefect, to whose powers his own are, however, much inferior, at once as the chief provincial executive and as the representative of the central government. Belgium has developed to a unique degree the institution of the Permanent Deputation, a group of six councilors meeting frequently in the presence of the governor. Exercising a wide variety of functions, including the preparation of material for the council's discussions, the execution of certain of its acts and the supervision of the communal authorities, the Permanent Deputation has become one of the most important and independent of Belgian local institutions. It is, however, the commune which has preserved in its greatest vitality the mediaeval tradition of local autonomy. According to the common continental practise all of the 2630 communes of Belgium, whatever their size or importance, are organized on the same plan, each having a communal council popularly elected for six years; a burgomaster appointed from the members of the council nominally by the king, but in reality usually upon the council's recommendations; and a body of *échevins* elected by the council from their own midst to act with the burgomaster as the chief executive. A spirit of deference pervades the attitude of the central and provincial authorities toward the communal governments. By law the councils are assigned jurisdiction over all that is of communal interest; and in contrast to the narrow interpretation given the similarly vague jurisdiction of the provincial councils there is little limit on their activity so long as it does not conflict with the specific provisions of national laws.

MAURICE CAUDEL

See: PARTIES, POLITICAL.

ITALY. The present constitution of Italy had its beginnings in the Statute granted by Charles Albert, king of Piedmont, in the revolutionary

days of 1848. Like its prototypes, the French constitution of 1830 and the Belgian constitution of 1831, its purpose was to introduce representative institutions and safeguard the elementary rights of the individual but at the same time to serve as a curb on democracy. Hurriedly drafted, it was little better than a bundle of constitutional maxims, badly thought out and badly pieced together. Legislation was entrusted to the crown and two houses of Parliament. Apparently it was intended that except in matters of finance the three should be equal in power. The Senate was appointed by the king from certain categories of high officials, ecclesiastics and men of intellectual rank or large incomes, all of them to be over forty years of age. The Chamber of Deputies was elected on a restricted franchise; no man under thirty and, implicitly, no woman could be elected, and there was no payment of members. The king could dissolve the Chamber, whereupon new elections had immediately to be held; but apart from this there was no statutory provision for meeting cases of disagreement among the three legislative powers. Nor was there any serious attempt to define the relations of legislature and executive. The king nominated and dismissed the ministers; under another article of the Statute ministers were made responsible, but there was nothing to show to whom the responsibility was due. Implicitly the king could choose his cabinet without reference to party, and there was no provision and perhaps no intention that it should correspond with the political composition of the Chamber.

The Statute called itself "the perpetual and irrevocable fundamental law of the monarchy." This reads as though it were intended to form a rigid constitution, and there is no provision for amendment. But the omission was perhaps due to careless drafting, and it is more likely that the aim was to guard against any withdrawal of the crown's concessions, to stereotype the joint rule of crown and Parliament and to establish for all time certain elementary rights; it was for these reasons that the Statute required each succeeding king to swear to observe it. At all events the practise of the constitution was silently but steadily modified in the direction of complete parliamentary rule. Ministerial responsibility to Parliament became unchallenged, and the cabinet was generally chosen from the parliamentary majority, although in the absence of strongly defined parties the full implication of this was only gradually understood. The financial supremacy of the Chamber was on the whole

established, although the Senate retained its right to amend the budget. The Statute limited parliamentary approval of treaties to cases involving a territorial change or new financial liabilities, but Parliament tacitly assumed its right to be consulted on all treaties. It came to be accepted that a provision of the Statute which had ceased to be observed, lapsed. But until 1922 Parliament was very reluctant to make any formal change in the Statute; obsolete provisions were not repealed, and no laws were passed to give effect to the new constitutional principles which had silently asserted themselves.

While parliamentary government thus evolved on the lines of modern democracy, there had been a corresponding development of the rights of the individual citizen. The Piedmontese electoral law of 1848, effective in Italy until 1882, gave the franchise to those males who paid forty lire in direct taxation or half that amount if they possessed certain educational qualifications. Cavour intended it to "bring the suffrage down to the shopkeeper who had a little competency of his own and a good pot-au-feu every day"; in Piedmont, a land of small holdings and a fairly diffused education, it included the great mass of rural householders. But when the rest of Italy was annexed, the south with its large estates and its illiteracy had few electors, and in 1874 only 2.2 percent of the whole population possessed votes. It needed a whole generation to bring about any extension of the franchise. Not until 1882 was it extended to all males who had passed through the elementary school. As elementary education had become compulsory, at least in name, in 1877, this would in time have meant universal suffrage. But the process was likely to prove too slow; in 1900 the electors barely exceeded 7 percent of the population. In 1912 the vote was given to all males of age except illiterates under thirty, and in 1919 the disqualification for illiteracy disappeared. Voting was by *scrutin de liste* from 1882 to 1891 and proportional representation was introduced in 1919. The absence of a parliamentary tradition, the fact that the constitution had come from the educated middle classes rather than from the masses, the ignorance of the south—all combined to make a large part of the population indifferent to their citizenship. The influence of government was extensively used to control the elections; in most constituencies of southern and middle Italy the candidates were the nominees of the government or their local agents. The election of 1921 was the only one

in which voting throughout the country was really free. None the less, as the Socialists and Christian Democrats became strong parties at the end of the century, popular interest in Parliament grew very rapidly; and after the World War the non-governmental parties were able to return more than half the deputies.

The Statute guaranteed most but not all of the elementary rights of the individual. All citizens were made equal before the law and after 1850 could be tried only in the king's courts; all financial privileges were abolished; there could be no arbitrary confiscation of property; a man could live and move where he pleased and his home was made inviolable. A few years later the postal act (1862) and the penal code secured the secrecy of correspondence. There were, however, some serious limitations to personal freedom. The press was freed from censorship (an ecclesiastical censorship over books of devotion soon became a dead letter), but a vague and dangerous proviso sanctioned a law "to restrain its abuses" and an act of 1848 penalized attacks on king or Parliament and provocation of class hatred. The right of meeting in public places was subjected to police regulations, and under the strict wording of the Statute meetings could be forbidden by the police. This, however, was very rarely acted on and a subsequent law of 1889, which required the conveners of a meeting to give previous notice to the police, seemed implicitly to recognize the freedom of assembly, although the police still possessed the right of breaking up meetings under certain circumstances. The Statute was silent as to the rights of combination and association, but in practise full liberty was recognized and the penal code by punishing criminal and dangerous associations admitted the lawfulness of all others. In the short reaction of 1898-99 the government introduced a bill which empowered the prefects to forbid meetings in public places and allowed the government to suppress any association whose object was to "subvert social order by overt acts." When the bill was shipwrecked in the Chamber, the government enacted it by royal decree; but after the fall of the reactionary ministry the fullest liberty was allowed to trade unions and all other associations down to the revolution of 1922.

Royal decrees (*decreti-leggi*) such as this were flatly contrary to the Statute, which laid down that "the King . . . makes the decrees and regulations necessary for the execution of the laws, but without suspending or dispensing with their

observation," thus plainly excluding any action contrary to the existing law. But even before 1898 some not very serious attempts to legislate by decree had been made; and the precedent of that year threatened the whole constitutional structure, until the Supreme Court pronounced that a *decreto-legge* had only the status of a bill before Parliament. Vague as the ruling was, it quashed any recourse to decrees for the time being. During the World War decrees were revived again, partly of necessity, and they became dangerously common. But in 1922 the Supreme Court again intervened, and no more were issued in the brief interval up to the days of Fascist rule.

Under the Statute and amending legislation judges and magistrates were appointed by the government under strict rules as to qualifications—in some cases after an examination. Judges of the Supreme Court were appointed by the cabinet itself, other judges and magistrates by two special committees. There were no unpaid magistrates. The Statute and supplementary legislation enacted in 1856 made all magistrates irremovable after three years' service. Since 1873, a commission of magistrates has been consulted upon transfers of magistrates from one district to another, but the decisions of the commission are not binding upon the government. More serious penal cases and all cases of a political character come before juries which are drawn only from the educated middle classes.

The Statute left the somewhat amorphous local government of Piedmont unaltered, and it was not until 1859 that all communes, large and small alike, were placed on the same footing, with fairly extensive powers; provincial government was left a mere skeleton. After the annexation of the middle and south the question became acute between the quasi-autonomists of the new provinces and those who believed that only a centralized state could mold the divergent parts into a whole. For a time the latter had their way, but in 1878 mayors (syndics) became elective, a few years later government control was curtailed, and in 1903 the powers of the councils were much extended. The compulsory powers of the communes extend over streets, communal roads (which are more than half of all roads), lighting, sanitation, elementary and some secondary education, relief of the poor, local police and prisons. The permissive powers, which, however, are subject to the prefect's veto, cover all "services or offices of public

utility," which may include such matters as theaters, municipal music and museums. There was much complaint even before Fascist days that the prefects, who are government officials, used their power to check useful developments. The Communal Council meets twice a year and in the meantime the work is done by a junta, which carries out the resolutions of the council and drafts the budget and by-laws. There are no intermediate bodies between commune and province. The provinces, which have an average population of about 450,000, control provincial roads, rivers, most secondary and technical education and the care of lunatics and have certain supervisory powers over elementary education and charities. Their councils meet once a year, nominally at least for a month's session; they appoint deputations corresponding to the communal juntas.

Thus by the close of the World War the constitution, originally confined to Piedmont but extended to the whole of the peninsula as Italian unity was gradually achieved, between 1859 and 1870, had traveled far from Charles Albert's Statute. The king's position was nominally unaltered, but in practise he had come precisely as in England to be a symbol and an influence, not a power. The Senate, still a nominated body, had almost gone into oblivion and had tacitly surrendered its right to amend the budget. The Chamber of Deputies had practically absorbed all legislative power and—at least in principle—controlled the administration; the powerful bureaucracy, however, still often evaded its orders. General manhood suffrage existed; and although government still used its influence in many of the constituencies and although in parts of the south apathy paralyzed public life, the electorate was free and active in the large towns and throughout the north. Individual rights had broken through the restrictions and silences of the Statute and were now amply secured. But changed as was the constitutional structure, the new developments only translated the spirit of the Statute into fact. They had come about more by custom than by law, and the frame of the Statute remained hardly impaired. It was a peaceful, silent movement, untouched by any constitutional upheaval.

This development was roughly reversed by the Fascist revolution of 1922. The main constitutional results of Fascism have been to replace democratic government by the rule of a single political party or in actual practise by that of an individual autocrat; and to nullify

most of the personal rights which characterize popular government.

After eight years of change the Chamber of Deputies remains but is elective only in name. The electoral plan, which effectively cancels all contact between the Chamber and the voters, is based on the "corporative system," which now regulates the industry of the country. The committees which control each group of employers or workers, and which are strictly subordinated to the government, nominate 800 persons, double the number of the Chamber; certain non-industrial units nominate a further 200. From these nominees the Grand Council of Fascism selects 400 but can go outside the nominated lists to any extent. The 400 names are submitted to the electors, who can vote Yes or No only for the list as a whole. To secure even more thorough obedience the Grand Council can remove any deputy. It is the boast of Fascism that it has subordinated the legislature to the executive and has made Parliament a "technical institution" to advise on details only.

All power is centered in the "chief of the government." No measure can come before Parliament except with his consent. He can override the law in any matter that pertains to institutions of public utility, and this gives him unbounded authority over the economic and social framework of the country. The vicious system of *decreti-leggi* has returned in full force; and although they must subsequently be approved by the Chamber, the Chamber is too completely in the chief's hand to refuse consent. The cabinet consists of officials who are merely his executive agents and have no collective responsibility. He (no longer the king) commands the army and navy; he can dismiss judges and magistrates who are suspected of views contrary to those of the government; all government posts are occupied by Fascists, who as such are bound to obey him; the Court of Accounts, which audits the state's finances, is directly dependent on him. In practise no one is placed on the bench unless he can prove his adherence to Fascism, and the bench thus becomes the monopoly of one party. No possible focus of opposition survives. Free local government has disappeared and all communes are ruled by *podestàs* appointed by the ministry. The king retains his nominal right to refuse consent to a law, but he is as impotent to act as before. The Senate still exists, but it may only debate such matters as the chief permits. Overshadowing Senate and Chamber is the Grand Council of Fascism, con-

sisting mainly of high officials of the Fascist party, who are nominated by the chief and meet only at his summons. Apart from some major constitutional questions it discusses only such matters as he allows. Subject to this veto it supervises the whole discipline of the Fascist party; and as that party is the only one recognized by the state, the chief through the Grand Council controls the life of the country.

The Italian constitution has thus changed from a democracy to a virtual autocracy. There is a corresponding revolution in the rights of the citizen. All security for personal freedom has disappeared. All charges of a political nature (and political charges often cover a very wide field) come not before the ordinary courts but before special tribunals, composed mainly of Fascist officials and officers of the Fascist militia, from which there is no appeal and which may hear cases in camera. Juries have been displaced by "assessors" who are appointed by officials of the government and in consequence are taken from the ranks of the Fascists only. No lawyer or journalist or doctor or teacher can practise without the approval of a Fascist committee, and in effect all but Fascists—at least nominal Fascists—are barred. Workers have no legal status in respect of their wages unless they join a Fascist "syndicate." Every association or union of whatever nature must submit for approval its rules and list of members, and the prefect may dissolve and seize the property of a society which in any way opposes the government. No meetings—not only political meetings but even meetings for charity or sport—can be held without the consent of the police or the prefect. The prefect may confiscate any newspaper which criticizes the government, and as a consequence the opposition press has ceased to exist except clandestinely. It is a crime punishable by not less than three years' imprisonment to express ideas contrary to those of the government, and the police are the sole judges of the offense. Under the penal code of 1930 any person suspected of disaffection may be required to live in an appointed place under police supervision or he may be sent to a penal settlement. A man's home is no longer secure against the police, the secrecy of the post is systematically violated and espionage is universal. There is little personal liberty left to Italians.

BOLTON KING

See: FASCISM; FUNCTIONAL REPRESENTATION; NATIONAL ECONOMIC PLANNING; PAPACY; CATHOLIC PARTIES.

GERMANY. Politically, Germany is one of the oldest countries in the world, with a tradition of sovereign imperial government extending, except for a short break during the nineteenth century, over more than a thousand years. The German people as a race is composite, with strong Slavonic intermixture in the east, a sprinkling of Jewish blood almost everywhere and many ties of consanguinity with Rhaetians, Italians and French in the south and west; it has, however, a firm conviction of being aboriginal, "von der Maas bis an die Memel, von der Etsch bis an den Belt." Many Germans believe that they are descended from the people who defeated the Romans in the time of the emperor Augustus and that they would still be a free nation with a clannish form of tribal government if they had not succumbed to the violent imposition of Christianity by Charlemagne and to the subtler influences of Roman law and statecraft in the early Middle Ages. Others, of a less romantic disposition, cling to the tradition of the Holy Roman Empire with its unparalleled richness of town life and the conception of a natural alliance between the ideas of empire and citizenship which underlay the policy of the imperial chancelleries before Vienna became the capital and the seat of a cumbrous bureaucracy. Still others look to the rise of Prussia and the War of Liberation against Napoleon or to Bismarck's empire as the true foundation of Germany. All of these, however, rely on proved past merits which are to be conserved rather than on an ability to do new and better things in the future.

The fact that Germany, with natural frontiers toward north and south, has had no fixed boundaries toward east or west is of primary concern in foreign policy; nevertheless, it has considerable importance for internal politics and government. The conflict between "westerners" and "easterners" has been an ever recurring problem to German politicians, who have to steer a path between the opposing points of view of the two parts of the country. In the east as much as 80 percent of the land is in large estates tilled by a kind of serf labor; in the west as much as 90 percent is in small farms cultivated by the owner and his family. The east is conservative, the west liberal. In the former human life is governed by a strange mixture of determinism and individual obstinacy; in the latter life is easy. In the west tolerance and long suffering patience, by no means irreconcilable with a shrewd sense of a good bargain, count for as much as, in the east, a severe obedience to duty

and a profound conviction that life means ruling or being ruled. The loss of Germans in the territories ceded under the Treaty of Versailles is slightly greater in the east than in the west. The western frontier districts moreover still have direct contact with French, Franco-Swiss and Dutch civilizations, contacts which even in periods of acute conflict such as 1923-24 or 1931 help form national character and build up an intelligent public opinion concerning government. In the east contact with Russia has been artificially severed by the provisions of the peace treaty; and the bitter struggles among Poland, Lithuania and Germany, while fanning nationalist feeling, have weakened the influence and reduced the share of the frontier provinces in the domestic policy of their countries. Such factors explain a slight but unmistakable predominance of the west and southwest over the east in the German government in the last decade; the comparative prosperity of such cities as Stuttgart, Mannheim, Ludwigshafen, Frankfurt, Hanau, Cologne or the Ruhr towns as against Munich, Plauen, Leipsic, Breslau and Königsberg and the rapid growth of such a typically western industrial combine as the I. G. Farbenindustrie (Dye Trust) are partially related to this governmental balance.

Two far reaching governmental changes have taken place since the outbreak of the World War. In accordance with the constitution of the empire the outbreak of war transferred the civil power of government to the military authorities; administration consequently became highly centralized and the war bureaus went far in the direction of state socialism. The very fact that the Parliament kept its constitutional functions during the war and even strengthened its influence during the last stages only tended to emphasize the overwhelming importance, as opposed to local government, of the political center of government in Berlin and its more or less socialist tendencies, only thinly veiled by the semblance of military power. The breakdown of the monarchies, sudden and violent in Bavaria, Prussia, Brunswick and elsewhere, peaceful in certain other states, notably Württemberg and Baden, brought another great change in form and substance. While most civil servants served the new government loyally, the influence of the army in public life disappeared with the monarchy. The personal relation between the sovereign and every member of the *Offizierkorps* (including officers of the reserve and therefore almost all civil servants of higher grade) had

meant much more to the general spirit of government in the German states than the monarchic form of government itself. The full effect of these changes did not appear at once; on the contrary, a superficial study of German government during the years of consolidation after the restoration of the currency in 1926 might have led foreign observers to conclude that, except for the outward signs and emblems of the republic and the stronger hold of the central government on finance (since Erzberger's reform of finance), the government of 1929 was not essentially different from that of 1913. Only the crisis of June and July, 1931, fully revealed the transition which had taken place from *Rechtsstaat* to *Wirtschaftsstaat*, the transfer of governmental power from the public services—the bureaucracy—to the party organizations and the economic interests behind them.

While constitutional lawyers differed as to whether Germany under the constitution of 1871 was a federation of sovereign states or a federal state with strong reservations in favor of state sovereignty, it was evidently not a centralized state like France, Italy or Great Britain. The component states were sovereign, free to choose their own form of government—whether a republic like Hamburg, a parliamentary monarchy like Württemberg or Bavaria or a more or less feudal monarchy like Prussia or the Mecklenburgs. The governments of the states governed the Reich through the Federal Council (*Bundesrat*, *q.v.*), the members of which voted according to instructions from their governments. The council had the deciding voice not only in legislation but also in directing domestic policy. Special provisions were made to protect the smaller states against a possible *Majorisierung* by Prussia, which, however, had seventeen votes in the council, enough to veto any constitutional amendments. Patronage remained almost wholly with the states. The Prussian governmental departments, for instance, wielded a much greater influence than the corresponding departments of the Reich. The Reich had the paramount power of taxation, but taxes were assessed and collected by the states.

Under the Weimar constitution of August 11, 1919, the substance of sovereignty rests with the Reich. The states became *Länder*, or provinces, and most of the state assemblies, for one reason or another, lost their former standing and influence. The Reichsrat, which replaced the powerful Bundesrat and in which the governments of the *Länder* were represented according to popu-

lation, was made distinctly subsidiary to the Reichstag, elected by universal, equal, direct and secret vote of all men and women over twenty. The Reichsrat may object to measures passed by the Reichstag, but if the latter repasses them by a two-thirds vote they become law unless the president within three months submits them to a popular referendum. The federal constitution may be amended by a two-thirds vote of the Reichstag (two thirds of the members being in attendance), even though the Reichsrat may disapprove, but the latter has the power of demanding a referendum in such cases. The constitution enumerates specifically the powers of the federal government. These include various exclusive and concurrent powers as well as a broad optional power over social welfare and public order and safety and the power to establish general principles to be observed by the *Länder* in dealing with certain questions, such as education, religious associations and land law. All powers not assigned to the federal government remain with the *Länder*, but under the so-called principle of *Kompetenz-Kompetenz* the national government can extend its own powers by national legislation. The fundamental supremacy of federal over provincial law is generally assumed to follow from the statement in the constitution that "Reichsrecht bricht Landesrecht."

The constitution goes so far as to prescribe the broad outlines which must be followed by the *Länder* in their own constitutions; it provides that every *Land* must have a republican form of government, with a unicameral assembly elected on the same basis as the Reichstag and controlling the provincial government (*Landesregierung*). Of the sixteen *Länder* only Prussia has a second chamber (*Staatsrat*), consisting of representatives of its subsidiary provincial legislatures (*Provinziallandtage*) and possessed of practically the same rights with reference to the Prussian Landtag as the Reichsrat with reference to the Reichstag. At the time of the framing of the constitution various attempts were made to restrict the power of Prussia in the Reich. Although it possesses over half the nation's population, its vote in the Reichsrat was restricted to two fifths of the total, with the further provision that half of the Prussian votes must represent the subsidiary provincial governments in Prussia rather than the Prussian government itself. The provision in the constitution which permits the Reich to change the boundaries of a *Land* on the basis of a plebiscite of the people

concerned and without reference to the wish of the *Landesregierung* looked to a possible future partitioning of Prussia.

Various other constitutional provisions and practises have contributed to centralization. Among these is the system of election on the basis of proportional representation by party lists throughout the Reich. Patronage has gone from the states partly to the government of the Reich, partly to the parties forming the government, partly to big business. Taxes are assessed and collected by the Reich; a percentage of certain revenues is assigned to the *Länder*; in addition, certain grants and subventions are paid by the Reich to the provinces. Even military command is more strictly centralized than it was under the imperial constitution, a fact of great importance in connection with article 48 of the new constitution, which authorizes the president in case of need to take coercive measures against a *Land*. Political centralization has proceeded side by side with economic centralization, both in banking and in the more important industries. Decentralized local industries and agriculture have again and again had to apply to the central authorities for financial assistance. Centralization will to all appearances proceed still further, although the inability of both government and industrial leadership to cope with the increasing burden of nation wide activities became manifest during 1930 and 1931.

The constitution provides for a president to be elected by direct popular vote for a term of seven years. He is given extensive powers, but all his political acts require ministerial countersignature. He appoints and dismisses the chancellor, who forms his cabinet with the consent of the president and Parliament. The chancellor practically directs the policy of the Reich; this means, under the republic as under the empire, that he controls not only the administration but also the general trend of legislation and the holding of the balance between the conflicting interests of industry and labor, agricultural and municipal policy, producers and consumers. The government in Germany furthermore assumes direct responsibility for health (state hospitals, control over the medical profession) and social welfare (compulsory state insurance, factory inspection, slum clearance and so on), for public entertainments and sports and above all for education up through the university.

General experience seems to indicate that bureaucracy thrives on centralization, while federal and local government favor the participation

of voluntary lay functionaries in public administration. The German development shows a different trend. The federal state before the war relied mainly on the efficiency and probity of the civil service, which in spite of the complaints of the commercial interests about the overstaffing of government departments and municipal offices created a feeling of security more than worth its financial cost. During the first years of the republic the civil service by the sheer force of its numbers contributed very materially to the maintenance of orderly government. During the period of inflation, since civil servants received approximately the value of their normal salaries and since almost every family group included at least one or two civil servants, they were the means of supporting millions of persons throughout the period of inflation. As late as 1928 or 1929 they seemed to be the mainstay of the German state against the political radicalism and the economic class hatred which through communism and trade union bureaucracy, on the one side, and through the National Socialist and Stahlhelm movements and the growing restlessness of the large commercial employees' organization, the *Deutschnationaler Handlungsgehilfen-Verband*, on the other, threatened to destroy all government. Since then, however, this stabilizing power of the civil service has been shattered. With increased unemployment, with almost 100 percent of the youth who before the war would have joined the army now swelling the ranks of the storm troops (*Sturmabteilungen*) of the radicals and with big business getting an ever stronger hold on the central government the Reich has not been strong enough to protect itself through protecting its servants. A policy of curtailing salaries, restricting appointments to higher posts and taking away security of tenure and pensions has set in and has lowered the status of the civil service and sensibly impaired its efficiency.

Centralized Germany tries to govern itself without a strong civil service. The federal government has no complete civil service of its own for the administration of internal affairs. In general the execution and in some cases the details of federal legislation are left to the state administration. The departments of the central government exercise a certain supervision over the state administration of federal laws; article 48 gives the federal government an ultimate agency of control over the states. Considerable reliance is placed upon the functioning of trade union, guild or Fascist organizations (*Bünde*). This in

turn works to the detriment of democracy; for representation, according to the new conception of the state, is to be understood as belonging not to individual voters on the principle of equal rights, but to groups in accordance with their importance for the commonwealth and, until this relation has been fixed by law, to the strongest group. It is no longer the ability, the sense of responsibility and the independent mind of an expert that are wanted for the public service; it is the loyalty of the greatest number of followers, respect for the badge and for orders issued from headquarters, which carry those groups to power.

In a country which for half a century at least has been informed about public affairs by newspapers serving the cause of no less than five (now seven) large parties and about a dozen smaller ones, public opinion can hardly be expected to find a strong, clear expression. During the years immediately preceding the war Germany went through two or three crises in which popular feeling became so violent as to influence the attitude of the imperial government, notably after the *Daily Telegraph* affair and a few other acts of supposed or real political interference on the part of the emperor. No very marked influence of popular will or public opinion on the government is to be noticed since 1919. The formal right of referendum or initiative (constitution, art. 73, sect. 2, 3, 76; cf. Prussian constitution, art. 6) is robbed of much of the educational value it has in Switzerland or some of the Scandinavian countries by the severe conditions prescribed. In the Reich the initiative has been tried twice between 1919 and 1931, both times unsuccessfully. Since an absolute majority of all those on the voting registers is required for constitutional amendments, the vote is practically public. Those who go to the polls on such an occasion are expected to vote for the measure. The opposition exhorts its followers to abstain from voting but "to have a good look at those who vote and to remember." Elections can hardly be said to express the will of the people. They must vote for parties instead of individuals; and proportional representation excludes byelections, which in England do so much to provide opportunities for criticism or support of the government.

The influence of the government on public opinion has increased through the monopoly which it exercises in broadcasting and the more or less direct control it enjoys over the programs of German radio stations. But even in critical

times governments have been very slow to wield this power. A recent emergency decree authorizing the government to demand from any newspaper the publication, without comment, of any governmental proclamation or declaration has remained a dead letter. Theaters and cinemas are remarkably unfettered by government censorship. Today not a single large newspaper is an out and out supporter of the government, much less its official mouthpiece.

Both civil and criminal courts enjoy full independence, and nominations for judgeships are generally free from party interference. In a few cases the old tradition of appointing high court judges exclusively from the ranks of the judiciary (including public prosecutors) has been forsaken and barristers have been appointed, but as a rule a judge's career leads him, after he has passed his state examinations, successively from his first office as an assessor to district court, appellate court and high court judgeships. The system of special administrative courts had been inaugurated long before the war and works to general satisfaction. The *Staatsgerichtshof*, created by article 13 of the Weimar constitution to decide conflicts between state and federal law, has thus far found few opportunities to show its usefulness. It does not possess the right of judicial review over the constitutionality of federal legislation. A national system of labor courts, paralleling the ordinary district and appellate courts and possessing its own final court of appeals, the National Labor Court (*Reichsarbeitsgericht*), was instituted in 1927 (see COURTS, INDUSTRIAL).

Like the courts the *Reichswehr* (the small voluntary military force permitted under the Treaty of Versailles) and the small navy have been kept out of party politics. As in the case of his colleagues the minister for defense must resign on a vote of no confidence directed against him. Minister for Defense Dr. Otto Gessler, during whose period of office the German *Reichswehr* practically came into being, was a civilian and a member of the democratic left.

The second part of the constitution contains an elaborate statement of the rights and duties of the individual. Among these is a provision (article 165) for the establishment of a hierarchy of workers' councils in individual establishments, economic districts and the country as a whole. These were to cooperate with employers and other classes of the population in the creation of district economic councils and a federal economic council. The latter body was to be

consulted by the government on all proposed economic and social legislation. The system of councils in individual establishments has been functioning vigorously, but in the absence of the intermediate structures only a provisional federal economic council has been created (see NATIONAL ECONOMIC COUNCILS).

The constitution expressly provides for the separation of church and state; a series of concordats between the German states and the Holy See or the Evangelical Synod make for a better relation than would a closer union involving the appointment of ministers by the head of the state. Prussian Protestants complain about the increasing influence of Catholicism in public life. The Catholic Center is the only party which since February, 1919, has never been out of the frequently changing government coalition; most of the time in fact it has led it, at least in domestic affairs. This record corresponds to the real strength of a party which has the supreme merit—in a democracy—of embracing all orders and classes.

SWITZERLAND. In the course of the last half century the government of Switzerland has attracted a measure of attention quite disproportionate to its size. Before the World War the interest of foreign observers was due mainly to the fact that it was a European republic and an Old World democracy. As a republic it was almost unique and as a political unit that had never been anything but a republic it was entirely unique in Europe. Furthermore the continued use in some cantons of the *Landsgemeinde*, an annual meeting of all the voters to elect the executive, adopt the budget and discuss and pass on new legislation, and the novel political devices of the initiative and the referendum, which are attempts to infuse the spirit of the *Landsgemeinde* into modern representative institutions, made Switzerland a democracy in spirit as well as in structure.

Now that the World War has so vigorously republicanized Europe, that the Swiss system of direct democracy has been so extensively copied elsewhere and that Switzerland herself has so steadfastly refused to extend the suffrage to women, the persistent interest which Switzerland still arouses abroad as a political experiment

seems due to causes that are different but hardly less significant.

In the first place, it is more and more frequently pointed to as having alone succeeded in solving the so-called minorities problem which has come to loom so large on the European horizon. It is to this aspect of Swiss policy that Woodrow Wilson had already alluded when long before the war he wrote: "The Cantons . . . having allied themselves, went on to show the world how Germans, Frenchmen and Italians, if only they respect each other's liberties as they would have their own respected, may by mutual helpfulness and forbearance build up an union at once stable and free" (*The State*, rev. ed. Boston 1901, p. 300-01). The secret of this success, which the World War at first seemed to threaten but finally confirmed, is to be found in two distinct institutions: national federalism and international neutrality. Until the Napoleonic period Switzerland was a very loose confederacy of sovereign cantons. In 1848 after a brief civil war she became a federal state by adopting what was a conscious and deliberate imitation of the bicameral constitution of the United States. In spite of the closer union thus realized and in spite of the growing centralization which modern industrial civilization has brought with it the Swiss cantons remain their own masters in all such vital matters as public instruction, church organization, judicial procedure and direct taxation. Internally, linguistic and religious minorities govern themselves in accordance with their own wishes. Externally, they are protected against any violation of their international preferences by the policy of permanent neutrality which Switzerland with more political wisdom than logical consistency has succeeded in maintaining in spite of her membership in the League of Nations.

The Swiss military system may be said to constitute the second governmental feature which awakens most interest abroad. It is based on the principle of general compulsory service but it differs from the system of conscription prevailing among other European nations in that it does not provide for a large standing army nor give rise to a numerous and influential class of professional soldiers. In many respects the Swiss army is the most distinctive characteristic and the most typical product of the governmental system of the country. It would doubtless be the most difficult to introduce elsewhere because it is based on ancient and peculiar traditions of what might be called conservative national de-

mocracy. Unless restrained by such a tradition the armed and trained masses which it organizes and places under the command of officers drawn solely from their own ranks would constitute a permanent menace to the state. And unless disciplined and inspired by such a tradition the army would be a mere rabble unfit to face a technically superior foe. As it is, the growing importance of the pacifistic Socialist party, on the one hand, and the increasing mechanization of modern warfare, on the other, constitute a double challenge to the future of the Swiss military system.

The third outstanding feature of political Switzerland is that even among those states in which democracy is neither estopped by open or disguised dictatorship nor frustrated by corruption Switzerland may be said to stand alone in that its conception of democracy is not limited to electoral equality. The latter is essentially a conquest of the nineteenth century, but its basis had been laid long before in the economic structure of the country. The early abolition of serfdom, the importance of communal lands, the prevalent practise of equal distribution among direct heirs of personal and real property and the example of direct political democracy in the primitive *Landsgemeinde* cantons had limited social inequality to an extent quite unknown in the neighboring monarchies, long before political democracy was formally and universally established. As a result democracy, which elsewhere triumphed defiantly and remains aggressive and even revolutionary, in Switzerland became or rather continued moderate in its demands and conservative in its temper. Its ideals are those of the social average and its standards those of liberal mediocrity. It is suspicious of all who rise above and generous toward all who fall below. But even if impatient of superiority in all its forms it deprecates violence as a means of restoring equality. Although about a fourth of the electorate are enrolled in a party which calls itself socialistic, even this minority is truly revolutionary in its aims only if and when in the opposition. When saddled with governmental responsibilities it readily conforms to the standards of the majority, which may be defined as liberally conservative and firmly national.

These general characteristics of the political temper of the Swiss people have found expression in the fundamental features of their political institutions in both the cantonal and the federal spheres. These institutions are devised to assure continuity of policy and to prevent any dramatic

outbursts of leadership. The executive, generally a committee of from five to nine members, usually representative of both majority and minority, is seldom if ever headed by an outstanding personality. The members of these collective governments are in most cantons elected by the people; in the confederation they are chosen by the legislature. Once put into office they remain there practically for life although they are subject to periodic reelection. In their general outlook as in their administrative efficiency they therefore resemble permanent officials more than politicians. As a body they are correspondingly strong, but as individuals they count for relatively little. They dominate the rather amateurish legislatures but whenever even their most important measures are rejected by the electorate at the polls, as not infrequently happens, they humbly submit to the will of their masters.

The federal legislature, the Federal Assembly, is composed of the National Council and of the Council of States. In the former the cantons are represented according to population. To the latter body the cantons send two members each; these members are now generally elected by the voters themselves, but in a few cantons they are still chosen by the cantonal legislatures. One outstanding characteristic of the Swiss federal legislature is the absolute equality of the two houses; neither enjoys any special prerogative or even any priority. The federal budget, for instance, may be first discussed in one house or in the other, as seems most convenient. All the cantons and municipalities have only one law-making body.

In the confederation, as in all cantons and towns, the right of final legislative decision is vested in the voters themselves. This right is so freely exercised in some cantons and cities that the functions of the legislature appear more advisory than truly legislative. In the confederation, in most cantons and in all the more important municipalities popular control of legislation is exercised by means of the referendum. In five of the oldest and smallest cantons it is still exercised at the *Landsgemeinde*; the same institution also exists in many municipalities. Not only the referendum, which is nothing but a right of popular veto, but even the initiative, by means of which the people themselves can introduce new measures, have in actual practise served only as conservative safeguards.

Neither in the federal nor in the cantonal sphere has the judiciary the exalted position it enjoys in Anglo-Saxon communities. The judges

are very numerous, not very well paid, often chosen for political rather than professional reasons and do not enjoy the social prestige of the most successful lawyers. The federal tribunal has never been given the right to reject federal legislation on constitutional grounds, despite various proposals to that effect. According to Swiss political theory the federal legislature is the sole judge of the constitutionality of any legislative action it may take.

Thus the governmental system of Switzerland works slowly, timidly, honestly and on the whole not ineffectively. Compared with the parliamentary systems of all surrounding countries it inspires confidence but hardly enthusiasm. It is bound to disappoint lovers of the heroic; but it both satisfies the needs and faithfully expresses the character of a small, prosperous, unimaginative but peaceful, laborious and solid people whom both their historical experience and the geographical propinquity of their great and more adventurous neighbors have rendered doubly cautious.

THE NETHERLANDS. The soil of the Netherlands is a product of the sea and the great rivers that find their mouths at the coast of Holland: the Rhine, the Meuse and the Scheldt. As Napoleon said, Holland is a "deposit" of these rivers. The Rhine takes its course through the main part of Germany; the Meuse flows through Romanic speaking regions. Descending the streams of those rivers tribes of Germanic and of Romanic origin met in Holland. Throughout the centuries foreigners from many countries immigrated into Holland, particularly Jews and Huguenots, who fled from the Portuguese, Spanish and French inquisitions and whose influence on the development of Dutch trade and industry has been very great. Like the United States, Holland has thus been a melting pot in which immigrants from very different origins have blended together into one nation fused mainly by the fire of eighty years of war for liberation from Spain.

At the beginning of the sixteenth century the Low Countries (Holland and Belgium, then called Flanders) were a part of the Holy Roman Empire. Charles v as emperor gave new privileges to the Low Countries by constituting them a unit within the empire in return for an annual contribution. His son and successor, Philip the

Second, increased the taxes and tried to halt the growth of Protestantism by introducing the Inquisition into Holland. The resulting revolution and war lasting from 1568 to 1648 was a struggle for religious and political freedom. These principles were laid down in 1579 in the Union of Utrecht, which marked the separation of Belgium from the northern provinces and presaged the independence of the latter in the Republic of the United Provinces of the Netherlands. It was in the same period that Grotius wrote his famous *Mare liberum* (1609) to prove that the Hollanders were allowed to find their own way to the Indies. There is in the history of Holland a close connection between the ideas of religious and political freedom and those of freedom of the seas and free trade.

The republic was a federation in which the power of the provinces was generally greater than that of the union. Executive power in each province was vested in a stadholder, or governor, a title which was carried over from the days before independence and implied the existence of a sovereign ruler in some foreign land. The stadholder, who might be the same individual in several or all of the provinces, was generally chosen by the provincial states, although at times several of the provinces vested the office hereditarily in the house of Orange. The extent of the stadholder's influence over public affairs depended on his personal qualities. Thus the influence of William III in Holland was so great that although he was at the same time king of England it has been said that in reality he was stadholder in England and king in Holland.

The invasion of Holland by the French in 1795 forced the stadholder William V to flee to England, and Holland became a part of the French Empire. After the defeat of Napoleon Belgium, which before the French Revolution had been under the control of the house of Austria, was joined with Holland to constitute the Kingdom of the Netherlands; the rulership was made hereditary in the house of Orange and the son of William V ascended the throne as King William I. In 1830 the ties of union, which had never been very strong, were broken by a Belgian revolution; and in 1839, all attempts at maintaining the union having failed, Belgium was permitted to secede as a separate kingdom.

The constitution of 1814, which set up a hereditary constitutional monarchy, drew largely upon the structure of the Republic of the Netherlands and upon the English Parliament. It has been revised many times—in 1815 and in 1840

to take account of the accession and the secession of Belgium; in 1848, 1887, 1917 and 1922 to provide for a steadily broadening democracy. Ministerial responsibility to parliament was established in 1848. In 1917 universal suffrage for all men and women on the basis of proportional representation was provided for in elections of members of the municipal councils, the provincial states and the lower house of the national legislature. There is an explicit stipulation that every representative shall vote according to his own conscience and shall not be required to consult his constituents, a reaction from the tradition during the republic that the deputies to the States General were merely the mandatories of their constituents.

Legislative power rests with the crown acting through the ministers and with the legislature, the States General. The lower house, or Second Chamber, consists of one hundred members elected directly by the people. It is the more powerful of the two chambers: government measures are submitted to it first for consideration and it has the power to initiate legislation. The upper house, or First Chamber, is elected by the provincial states on the basis of their importance; it has no power to initiate legislation and can only reject measures submitted to it or accept them without amendment. Executive power rests with the crown acting through the ministers. There is a council of state (*staatsraad*) which is appointed and presided over by the crown and which is consulted on legislative and executive matters. The spoils system does not exist in the Netherlands and the integrity and independence of the judiciary have been effectively maintained.

The country is divided into eleven provinces, each of which has its own assembly, or states, elected for a term of four years. The states meet only twice a year, but it chooses from its own members a permanent commission of six (four in Drenthe) which is in charge of the administration of the province. The chief executive officer of the province, however, is the commissioner, who is appointed by the crown and presides over both the states and the commission. The provincial states are entitled to pass ordinances for the general welfare of the province and to raise taxes subject to certain restrictions; provincial ordinances are subject to approval by the crown.

Subordinate to the provinces geographically are the communes, or municipalities. These have considerable power of local self-government, a

reminder that the origin of the democratic institutions of the Netherlands is to be found in the rise of the power of the cities. At the head of the municipality is a council which is vested with local legislative power and with the administration of local government. Each council chooses from two to six aldermen, who assist the burgomaster in the day to day administration. The burgomaster, who is nominated by the crown, has the double and accordingly difficult task of being the head of the municipal council and of representing the central government in the municipality. In order to maintain the principles of democratic government and at the same time secure greater efficiency in the practical administration of the growing tasks of the councils a large part of their business is delegated to special institutions, primarily mixed (private and public) companies, which are controlled by the municipal council and by the burgomaster and aldermen.

A peculiar feature of the local administration is the *waterschappen*, which arise from the necessity of building and maintaining dikes in those sections which are not protected from the sea by natural dunes. They are associations charged with the special task of maintaining the dikes; membership in them is compulsory and they stand on the same constitutional basis as the provinces and communes. The administration of the entire system of dikes rests with a special ministry (*Waterstaat*).

The legislature of the Netherlands is at the same time the supreme legislature for the colonies. In recent years, however, important steps have been taken in the direction of self-government for the Netherlands East Indies. A legislative assembly (*volksraad*) with its seat in Batavia on the island of Java was established in 1916 and met for the first time in 1918. Originally intended as a purely advisory body, it was converted by the Netherlands India constitution of 1925 into a legislative assembly whose assent must be asked for all ordinances presented by the governor general. The assembly is empowered to deal with internal affairs subject to the constitution and to statutes passed by the Netherlands legislature. The crown and in emergencies the governor general himself may override decisions of the assembly. The members of the *volksraad* are partially nominated and partially elected on the basis of three groups—Europeans, natives and foreign orientals.

See: LEGISLATIVE ASSEMBLIES; PARTIES, POLITICAL.

SCANDINAVIAN STATES. *General.* The three principal Scandinavian countries—Denmark, Norway and Sweden—are so closely related racially, culturally and linguistically that the prospect of political union between them inevitably suggests itself. As early as 1380 Norway had joined Denmark in a personal union and in 1397 there was actually effected a similar union between the three countries, which lasted with considerable difficulty and strife until 1523, when Gustavus Vasa set up an independent national government in Sweden. Norway gradually came to be administered as a province of Denmark and in 1814 it was ceded to Sweden, with the understanding that it was to be a separate kingdom joined to Sweden by a common ruler. The Norwegian people refused to acknowledge this cession and on May 17, 1814, adopted their own constitution as a free and independent kingdom. After a brief war with Sweden a compromise was effected under which Norway accepted the personal union with Sweden in return for the right to retain its own constitution with only such changes as the common crown required. The union went through many conflicts and crises before it was finally dissolved in 1905 on the initiative of Norway.

Since then the three countries have been distinct political entities, but the cooperation which they practised even before 1905 has taken on an increasingly important aspect. Since 1907 annual conferences of members of the parliaments of the three countries have been held for the discussion of matters of public law and economic policy of special interest to the three countries. In late years delegates from Iceland and Finland have taken part in these conferences. In the World War, as in previous wars beginning with the Crimean, the three countries jointly announced their neutrality. Various conferences of foreign ministers, of prime ministers and even of the kings themselves were held to deal with the problems of neutrality and of economic and financial adjustment entailed by the war. The three countries have adopted essentially uniform legislation on a wide range of subjects in the civil law and family law fields, including the laws of marriage and divorce. Their central banks and governments cooperate on questions of monetary policy. A movement for a closer cultural and educational association between the countries took formal shape in the organization of *Norden* societies in each of the three countries in 1919. Branches of the society were organized in Iceland in 1922 and in Finland

in 1924. Political union as such, however, is still very far away; to it the history of past unions, the conscious nationalism that has developed in each of the countries and the different problems of foreign relations oppose apparently insuperable obstacles.

KNUD BERLIN

Denmark, Iceland and Norway. Denmark. Denmark possesses an area of about 44,300 square kilometers (including the Faroe Islands) and a population of about 3,600,000. For nearly two hundred years, from 1660 to 1849, it was governed autocratically; under the impulse of the revolutionary events of 1848 the king granted a very liberal constitution on June 5, 1849, in accordance with the proposals of a popular assembly which he had summoned. This constitution was modeled most closely after that of Belgium but with more liberal suffrage rights. It introduced responsible ministers and a bicameral national legislature, consisting of two houses—the popular assembly (Folketing) and the national house, or senate, (Landsting), both chosen by vote of all male citizens over thirty. The constitution also created independent courts, guaranteed the usual civil rights and liberties and abolished all class privileges. In general the governmental structure created in 1849 still exists, but the constitution has been steadily developed in accordance with the usual European parliamentary practise.

This development, however, did not take place without a protracted political battle. In 1866 the composition of the Landsting was changed so that half of the elected senators were chosen by the large taxpayers, while the government appointed a certain number of life members. When a majority in the Folketing then demanded the resignation of the government and the introduction of a purely parliamentary rule, the Landsting opposed this demand as unconstitutional. Beginning about 1875 the conflict between the two houses was so bitter as to threaten the finance bills; and for nine years, from 1885 to 1894, the Estrup ministry governed by means of provisional financial decrees promulgated by the king alone. In 1894 there was a reconciliation; but in reality the Folketing won, although its victory was not complete until 1901, when a distinctly Left cabinet succeeded the earlier Right governments. Since that time parliamentary rule has prevailed in Denmark. Since none of the principal parties has had an absolute majority in the Folketing, which is the control-

ling house, the various parliamentary governments have generally been minority governments which have been able to count on more or less reliable support from other parties.

In 1915 thorough constitutional changes were effected. The suffrage rights for both chambers were made more democratic; the voting age for the Folketing was reduced to twenty-five years, that for the Landsting was raised to thirty-five years and woman suffrage was introduced for both.

For purposes of local government Denmark is divided into twenty-two counties, each of which is administered by a governor (*amtmand*) appointed by and responsible to the minister of home affairs and automatically chairman of the county councils. Local government in urban centers is largely in the hands of the municipal councils. In rural communities the parish councils are in charge of administration, subject to control by the county council.

The judiciary consists of about a hundred lower courts, usually composed of one judge; two courts of appeal (*landsretter*), which also serve as courts of first instance for major civil and criminal cases under certain conditions, in collaboration with a jury of twelve members; and a Supreme Court consisting of a president and twelve judges.

The government has not, except in the case of industrial accident insurance, entered into the administration of national systems of social insurance. It has, however, effectively subsidized and closely supervised the voluntary insurance organizations which provide protection against sickness, invalidity, accident and unemployment. The highly efficient cooperative system was evolved almost entirely without government aid.

Iceland. Iceland was first settled about 874 A.D. chiefly by immigrants from Norway; in 930 the Althing was established as the highest governmental authority. For the next 300 years Iceland continued as an independent republic, celebrated in its rich saga literature. The contest for power, however, among the leading chieftains' families gradually created such anarchy that in 1262 the island was made a dependent tributary under the kings of Norway. When Norway joined Denmark in 1380, Iceland followed as a Norwegian dependency; as Norwegian independence lapsed, it came to be governed from Denmark as a Danish tributary or colony. Together with the Faroe Islands and Greenland it stayed in Danish hands when Norway was transferred

to Sweden. The Althing, which had gradually degenerated to the position of a court of justice, had been entirely abolished in 1800 and Iceland had practically no local independence. In 1843 the Althing was revived, but only as an advisory body. After 1849 vain attempts were made from the Danish side to introduce the new Danish constitution into Iceland, where the independence movement had become more and more powerful. In 1874 Iceland was granted a free constitution with a large measure of self-government and a legislative Althing. But these concessions did not satisfy the demands of the Icelanders. Of equally little avail was it that in 1903, after the parliamentary form of government had been introduced in Denmark, Iceland received a special cabinet minister, responsible only to the Althing—a grant equivalent to a parliamentary form of government. In 1918, during the World War, a compromise was effected in the so-called Danish-Icelandic Union Law; by which Iceland was recognized as an independent country with, however, the same king as Denmark and with Denmark in control of its foreign affairs and of the fishing in its waters. The union agreement is to run for only twenty-five years, after which it can be denounced by either party.

The present fundamental law is the Constitution of the Kingdom of Iceland of May 18, 1920. In general it is modeled after the Danish constitution, with the important difference that the Althing consists of a single chamber. The Althing, however, follows the procedure of the Norwegian Storting and divides itself into two sections, called the upper and lower; in case of disagreement between these two sections over any legislation except financial appropriations a decision can be reached only in a joint session of the entire Althing and by a two-thirds majority. There are three ministers. The regime is of a decidedly parliamentary character. The system of local government differs from the Danish in that these are no county councils; the local and parish councils function directly under the central government. Neither are there any courts of appeal, but appeals go directly from the lower courts to the Supreme Court.

Iceland, whose population exceeds 100,000, has in recent years undergone a marked development, particularly in its fisheries. Having declared itself permanently neutral, it has no military establishment except three fishery inspection ships under the Icelandic flag.

Norway. Norway covers a territory of about 325,000 square kilometers and has a population

of about 2,800,000. The Norwegian constitution of 1814, which is still the country's basic law, provides for a peculiar single chamber system, which in course of time has undergone a remarkable change to a parliamentary type quite opposed to the type originally intended. Like the Swedish form of government adopted in 1809 and the American constitution of 1787, which were its most immediate models, it intended in accordance with Montesquieu's doctrine of the division of powers to create a sharp distinction between an independent executive power, exercised by the king, and an equally independent legislative body, the Storting, or General Assembly. The king was therefore to choose his own ministers, who were not to have seats in the Storting or even access to it. The power to legislate and to impose taxes was given to the Storting alone; the king could only propose measures and exercise merely a suspensive veto; he had no right to dissolve the legislature, which was elected for three years.

The Storting originally, however, had the right to remain in session only for two months every three years; the right to suffrage was practically restricted to the owners of real property; and the assembly, although chosen as a single chamber, divides after the election into two sections, a larger, the Odelsting, and a smaller, the Lagting, which in all legislative matters had the power of veto against each other, so that when they disagreed final decision could be made only in a joint session of the entire Storting and by a two-thirds majority. This was intended to assure the balance between the executive power of the king and the legislative power of the assembly. Further assurance was contained in the provision that constitutional changes could be made final only by a new Storting after new general elections and by a two-thirds majority, and that these constitutional changes should never alter the principles or spirit of the original law.

Nevertheless, in the course of time the constitution has been changed almost entirely, chiefly in its spirit and principles rather than in its structure: the independent executive power of the king has all but disappeared and the Storting has become the sole decisive agency which, as in other parliamentary countries, practically determines the formation or resignation of the cabinet. The chief contributing cause to this development has been the fact that during the union with Sweden the Norwegian king was also the king of Sweden and that consequently the struggle for separation from Sweden had to be carried

on against the royal power. To this was added the gradual democratization of the Storting, which culminated in 1898 with the introduction of general suffrage. As early as 1869 moreover an annual Storting had been introduced and in 1884 the Storting had despite the king's repeated veto forced through an amendment which made possible the personal attendance of the ministers at legislative sessions.

Although the main features of the constitution of 1814 still remain, the form of government is now decidedly parliamentary except for the fact that the king is still unable to dissolve the Storting. The Norwegian parliamentary governments, however, are usually, because of the sharp party divisions in the Storting, purely minority governments, which function only because and so long as the opposition parties cannot overturn them.

Local government is largely decentralized. There are popularly elected district and town councils, which elect an administrative committee from their own membership. These councils send representatives to a county council, presided over by a governor who is appointed by the crown but administers county affairs in accordance with the decisions of the county council. The units of local government have large powers in connection with such matters as taxation, education, health, housing and poor relief.

All judges are appointed by the king and may not be removed except by legal judgment. In the county and town courts, in both civil and criminal cases, two lay judges generally sit with the trained judge and participate in the decision not only on the facts but also on the law of the case. Criminal cases which may involve sentence of more than three years are heard by a *lagmandsret*, composed of three legally qualified judges and a jury of ten. The jury passes only on the question of guilt, and seven votes are required to convict. In criminal cases the Supreme Court acts only as a court of cassation and may not reverse a case on other than legal grounds. An interesting feature of the Norwegian and also of the Danish judiciary is the system of conciliation councils, elected for three years by the municipal councils. No case can be taken to the courts until after an attempt at settlement has been made through these councils.

KNUD BERLIN

Sweden and Finland. Sweden. The national code of laws, which was built up about 1350, contains what is probably the first written consti-

tution for the whole of Sweden. It provides the broad outlines for the government of a unitary state ruled by a single monarch elected by delegates from the self-governing provinces. In 1191 an aristocratic assembly (Herredag) was summoned for the first time to deal with national affairs; after 1435 it occasionally included representatives of the burghers and the peasants. With the national Vasa dynasty (1523-1654) succession to the throne became hereditary. The new demands of the "age of greatness" led to a marked development, reflected in the Constitution Act of 1634, in national organization and administration. The Riksdag had already become consolidated into four estates (nobles, clergy, burghers, peasants), which cooperated through common standing committees.

Beginning with the end of the seventeenth century, when the crown with the cooperation of the lower estates established a royal dictatorship, Sweden witnessed a succession of changes in political power and constitutional provisions with now the king, now parliament, dominant. The royal dictatorship never developed into a royal absolutism; the kings obeyed the law not from choice but from duty. But the Riksdag was gradually thrust aside, especially during the reign of Charles XII, with whom the dictatorship ended. With the constitution acts of 1719 and 1720 as a foundation there developed a strong parliamentary autocracy mainly supported by the bureaucracy, which through the officials in the capital controlled the nobles, through the increasing worldliness of the priesthood gained power in that estate and through the mayors of the cities and their councilors became a force in the estate of burghesses. This bureaucratic parliamentarism was overthrown with the coup d'état of Gustavus III in 1772, and a new constitution gave more power to the king. The constitutional changes of 1789 increased his power even more. The son of Gustavus III, mentally weak but stubborn, was unable to withstand the political storms of the Napoleonic era and was overthrown in 1809 by a revolution headed by officials and the military. A new constitution, which is still in force, was hastily drawn up in the midst of raging warfare.

Under the constitution of 1809 the Riksdag became more powerful, but the monarch retained much of his former authority in accordance with the constitutional ideals of the age and the need for a strong government. Eighteenth century experience with the misuse of parliamentary and monarchical power, and the current theories of division of power are reflected in the

balance set up between the legislative and executive powers. Since the old Riksdag of estates no longer had any basis in the structure of society and the prevailing points of view and had become a serious obstacle to needed reforms it was supplanted in 1866 by a bicameral system. Partly as a result of the influence of American models described by de Tocqueville competence and authority were equally divided between two chambers of different origin. The First Chamber was chosen for a term of nine years (since 1921, eight years) by the newly created county councils, which were based on fairly plutocratic suffrage rights and, in towns not represented in these councils, by the town councils; the Second Chamber was elected directly for a three-year term (since 1919, four years) on the basis of a more democratic suffrage. General suffrage for men was introduced for the Second Chamber in 1909 and for the electoral bodies for the First Chamber in 1921. Suffrage for women on the same basis as for men was established in the latter year. The democratic Riksdag, equipped with a number of standing committees common to the two chambers and provided with large secretariats, has proved exceedingly powerful. The personal prerogative of the king, which included the right of absolute veto, has been gradually replaced by a parliamentary regime which has strong support in a widespread democratic point of view and in a social order which includes a self-conscious, prosperous industrial working class and a large and important group of property owning farmers.

The king selects the prime minister after conferences with the Riksdag party leaders and the speakers of the two chambers. The prerogatives of government are exercised by the king in council, but the advice of the ministers carefully conforms to the expressed wishes of the Riksdag. The Riksdag supervises the work of the ministers and their advice to the king in council through the inspection of the cabinet records by one of the standing committees and through the continuous contact with the foreign policy of the government maintained by one of the Riksdag boards. The Riksdag can also secure the removal of a minister who does not respect its wishes or does not possess its confidence, although the constitution does not specifically provide for this. The central administrative departments are relatively independent of their respective ministers, but they must obey the orders of the government so long as these are in accord with specific laws.

Elections to the Riksdag, within the Riksdag and to the communal assemblies are since 1919 based on proportional representation. This makes the formation of stable majorities difficult. Since general suffrage came into effect, no individual party has succeeded in securing a majority in either Chamber. With a single exception all governments since 1905 have been minority governments.

The country is divided into twenty-four counties (*län*) and the county corporate of Stockholm. The governors, who are the heads of the county administration and the police, are centrally appointed. Each county has its council, the members of which are elected by the communes in the county. The counties are subdivided into rural and urban communes; each parish, borough or town forms a commune. The very comprehensive communal self-rule, based on legislation beginning in 1862 but placed on a purely democratic basis in 1918 and revised in 1930, is the predominant feature of local government. The towns although subject to the authority of the governor are governed by elected town councils or by assemblies of all electors formally supervised by the magistracy, consisting of the mayor and other members of the town court elected by the people. The rural communes are governed by an assembly of all electors and an executive committee or communal board of five to eleven members elected by the assembly. All communes having over 1500 people must and all other communes may transfer the greater part of the responsibility of administration from the assembly to a town or parish council.

The system of courts is collegial, with the exception of the rural district courts. The latter consist of a judge and twelve unpaid jurors, elected for six years by the people of the locality. The unanimous decision of the jurors both as to law and fact is the decision of the court; where the jurors disagree the judge decides. Appeals are permitted on all cases, except that since 1915 minor civil and criminal cases cannot be carried to the High Court of Justice. There is a supreme administrative court and various special courts, including since 1929 a court with final jurisdiction over labor agreements.

Finland. The constitutional history of Finland parallels that of Sweden until 1809, when Finland was separated from Sweden and joined to Russia under a common ruler but with its own constitution, which consisted of the Swedish constitutions of 1772 and 1789. From 1899 to 1905 Russian oppression of Finland became ac-

centuated and the revolution of 1905 in Russia was accompanied by similar action in Finland, marked by the establishment of so-called Red Guards and by a general strike. As a result the Finnish parliament received a new organization in 1906. The existing four-estate organization was replaced by a single chamber, created by general suffrage and proportional representation. The Russian Bolshevik Revolution of 1917 was followed by a declaration of the independence of Finland in December, 1917. Bitter civil war between the government, supported by the bourgeois classes and soon allied with Germany, and the radical social democracy, which was actively supported by Russian Bolshevik troops, finally ended in the triumph of the former. The Constitutional Law of July, 1919, converted the country into a democratic, parliamentary republic. In January, 1928, a new legislative charter was prepared.

The president of the republic is chosen for a six-year period by indirect popular suffrage; he has very widespread authority, which must generally be exercised, however, in cooperation with a minister. Among other matters he has independent constitutional powers in certain questions and suspensive veto power. Through constitutional changes in 1930 his power has been further increased, principally to strengthen the established order in case of danger from threatening Communist influences. The members of the cabinet must, according to the constitution, enjoy the confidence of parliament. Because of the number of parties most cabinets have been minority governments or bureaucratic administration ministries of no definite political color and of short duration.

The national assembly consists of a single chamber elected by general suffrage and proportional representation for three years; since 1930 Communists cannot be elected. Constitutional questions must after having been approved by parliament be postponed until a new assembly meets after new general elections, unless a five-sixths majority agrees that the measure is urgent and a two-thirds majority favors its adoption. Ordinary legislative proposals must on request of a third of the members of the Riksdag be postponed to the first session after new general elections. Certain financial measures, such as loans and new taxes, can be passed only by a two-thirds majority.

The principal administrative division is the province, whose administration is under the control of a governor appointed by and subordinate

to the Council of State. The provinces are divided into communes, administered by boards controlled by the central government but nominated by the popularly elected councils. The scope of local self-government has expanded, especially in municipalities, and now includes among other matters poor relief, health, fire protection and education, especially elementary education. The Swedish speaking Åland Islands group enjoys a comprehensive autonomy, and Swedish, like Finnish, is a recognized national language throughout the country.

The administration of justice is in the main organized as in Sweden.

RUSSIA. *Imperial Russia.* The Russian Empire became a constitutional monarchy only as late as 1905, when as a result of the revolutionary movement following the war with Japan Emperor Nicholas II granted his subjects civil liberty and the right to elect a representative legislative body. The Fundamental Laws of May 6 (new style), 1906, served as the basis for the new constitutional monarchy.

They provided that the legislative power should be shared by the emperor and the two houses of parliament—the State Duma and the State Council. Half the members of the latter were appointed by the emperor; the other half were elected by various electoral classes, or curiae: the clergy, the zemstvo provincial councils, the nobility, the academies and universities and the representatives of commerce and industry. The First and Second Dumas, chosen under the relatively liberal electoral laws of December 24, 1905, had majorities opposed to the government and were almost immediately dissolved. In 1907, contrary to the explicit provisions of the Fundamental Laws, the franchise was changed by imperial decree. Members of the Duma were thereafter elected by provincial electoral conventions consisting of representatives of the following electoral curiae: landowners, city inhabitants of the first and second taxpaying classes, peasants and industrial workers. The method of voting in the conventions coupled with the changes in the franchise assured a large majority in the Duma for the rich landowners and for the Russian as opposed to the non-Russian elements in the population.

Both houses dealt with legislation and the budget and had the right of interpellation; the army and navy, however, remained under the

direct control of their special councils with legislative functions and ministers responsible only to the emperor. The Duma's power over the budget was very limited. The emperor possessed an absolute veto over all legislation, and he alone could initiate changes in the Fundamental Laws. His power to prorogue the sessions of both houses or to dissolve the Duma was frequently used to dispose of the necessity of consulting it when it was unsympathetic. For when the Duma was not in session the ministerial council with the consent of the emperor was empowered to issue temporary laws. Such laws, however, could not change the Fundamental Laws or the statutes or election laws of the two houses and had to be submitted to the Duma within two months after the resumption of its sessions.

Full executive power, including complete control of the administration, rested with the emperor, who was still termed the autocrat-ruler in the Fundamental Laws. He had absolute control over foreign affairs; he appointed all government officials including the ministers, who were responsible to him alone. Responsibility was individual, not collective. The cabinet did not represent a cohesive unit and even the resignation of the prime minister did not entail similar action on the part of the other ministers. A vote of non-confidence by the Duma had no political consequences whatever.

The Fundamental Laws of 1906 thus created a dual constitutional monarchy, with the executive power completely separated from and independent of the legislative authority. The split between the two branches of government became very acute during the World War. The "progressive bloc," including the majority of the members of the Duma, tried in vain to induce the emperor to form a "ministry of general confidence." Instead, the Duma was brushed aside and complete and open control of the government assumed by the emperor and his ministers. The dissolution of the Duma on March 11, 1917, only a few days after it had assembled, was one of the immediate causes of the revolution.

For administrative purposes the empire was divided into ninety-eight large administrative units consisting of seventy-eight provinces, eighteen territories and two regions. Administration was effectively centralized through the provincial governors appointed by the emperor and responsible to the emperor and the minister of the interior. The governors controlled the police as well as all the officials and organs of government, including those of zemstvo and municipal

self-government in the forty-three provinces in which they existed. In Poland, Lithuania, the Caucasus and other sections a number of provinces were grouped under a governor general with powers greater than those of a governor. Finland, which had its own diet, was excepted for a short period after the 1905 revolution effectively controlled by a centrally appointed governor general. Central control was an important agent in carrying out the strong policy of Russification pursued by the central government in all areas where non-Russian elements were large. The larger cities were independent of the provinces but were administered by centrally appointed city captains (*gradonachalniki*), who had powers similar to those of the provincial governor.

The emancipation of the serfs in 1861 had been followed by far reaching governmental reforms. Zemstvo self-government was provided for sections of Russia proper in 1864 and town self-government in 1870. Legal reforms in 1864 provided for public trials, the use of juries in criminal cases and judicial independence. Elective justices of the peace were created to serve as courts of first instance for petty criminal and civil cases; appeals in such cases lay to district conferences of the justices of the peace. More serious cases came under the jurisdiction of district courts, in which juries were used; the courts of appeal were the judicial chambers (*sudebnie palati*). Two departments of the Governing Senate served as the final courts of cassation for civil and criminal cases respectively. In 1889 the justices of the peace were replaced in rural districts by land captains (*zemskie nachalniki*), appointed by the minister of the interior to perform administrative as well as judicial duties; not until 1912 was the system of elective justices restored in these districts.

The members of the zemstvo district councils were elected on a curia basis which assured control by the landowning nobility. The district marshal of the nobility, elected by an assembly of the nobility of the district, was chairman of the council, which elected an executive committee (*uprava*) from its own members. The zemstvo provincial councils consisted of representatives elected by the district councils and of the district marshals and the chairmen of the district executive committees as ex officio members. The provincial marshal of the nobility, elected by the district marshals, was chairman of the provincial council, which also elected an *uprava*. The control of the nobility was even stronger in the pro-

vincial than in the district councils. The councils could legislate with respect to education, health, roads and public welfare in general, but their power and effectiveness were greatly curtailed by the legislation of 1890, under which the approval of the provincial governor was required for their acts and their choice of officials. City councils, elected on the Prussian three-class system of representation, and their executive officers and committees were subjected in 1892 to the same control as the *zemstvo*. Nevertheless, the *zemstvo* and municipal councils did much to advance education, public health and general economic well-being and to develop a valuable type of public official.

Peasant self-government functioned through the village community (*q.v.*), which owned the village land and allocated it to individual householders, retaining the right of redistribution. An assembly of all the peasant householders of the village elected the elder and the village representatives to the assembly of the canton (*volost*). The cantonal assembly elected an elder and the members of the *volost* court, composed entirely of peasants who applied customary law. The powers of the *mir* and *volost* organizations were strictly limited and were subject to close control by the central bureaucracy, which used them as effective agencies for the collection of rents and taxes and the performance of other local tasks.

The emperor was the head of the established Orthodox church. The Holy Synod, at the head of which was a collegium of high ecclesiastics appointed by the emperor, controlled the church and was in turn supervised by the chief procurator, a layman appointed by and directly responsible to the emperor. In the hands of K. P. Pobiedonostsev this office was for twenty-five years a notorious agency of reaction.

Personal liberty was guaranteed in the reforms of 1905, but special permission was still needed to publish a newspaper, to hold a public meeting or to form an association. Declaration of martial law was frequently used to suspend even these rights. Trade unions were closely supervised; strikes were criminal offenses and the police and the troops were used to suppress them. As the revolutionary movement became stronger in the 1870's, repression by the government became increasingly severe. Under Alexander III political cases were removed from the jurisdiction of the district courts, where juries were required, and tried by the judicial chambers, which co-opted representatives of the nobles, merchants

and peasants to serve as juries. Arbitrary arrest was theoretically prohibited but the corps of gendarmes and the secret police (*okhrana*) were empowered to arrest, prosecute and send into administrative exile all persons "politically unreliable." Under this power great numbers of revolutionaries and other elements of opposition were expelled from the capitals and university towns and sent into exile.

PAUL GRONSKI

Soviet Russia. The government of Soviet Russia, the first country to put into practise the ideas of revolutionary socialism, holds a unique place among the governmental systems of the world. Not only does it provide a working illustration of the state as dictatorship of the proletariat but it also represents a synthesis of national cultures and international ideals. It is a government which by its very principles must eventually cease to exist; in form as in idea it is transitional, having as its ultimate aim the realization of Engels' conception of the withering away of the state.

The drastic nature of the revolutionary upheaval made necessary as well as desirable a complete change in the governmental structure and personnel of this state covering somewhat less than one sixth of the surface of the globe and including a population in 1931 of about 161,250,000. No constituent assembly wrought out the constitution of the new state; it took shape in the midst of external war and internal need. The constitution of the Russian Socialist Federative Soviet Republic (R.S.F.S.R.) was adopted by the Fifth All-Russian Congress of Soviets on July 10, 1918; on December 30, 1922, the union with the other constituent republics took place; in the summer of 1923 the draft of the constitution of the Union of Soviet Socialist Republics (U.S.S.R.) was adopted; this constitution was put into force on July 6, 1923.

Two of the most important problems which required immediate solution were the question of the basic form and structure of government and the problem of nationalities. The ideology for the solution of the latter problem—autonomy and federalism—had been prepared long since in the ideas of Marx and Engels and also with special application to Russian conditions in those of M. P. Drahomanov. The border nationalities had taken advantage of the Communist policy of self-determination and the protection of other powers to set up independent governments. The diversity of nationalities still remaining within

the borders of Soviet Russia led to the organization of the new state on a federal basis. The U.S.S.R. thus consists of seven constituent republics—Russia, White Russia, Ukraine, Transcaucasia, Turkmenistan, Uzbekistan and Tadzhikistan—which in turn contain a varying number of so-called autonomous republics and territories. The principle of federation on a national basis is followed throughout, the constituent members having the right to withdraw (article 4 of the constitution). National autonomy is thus guaranteed in theory and largely in practise as well; there is no legal discrimination between the races of the Soviet Union, and recognition of national languages and cultures has provided a great stimulus to their development. A satisfactory solution has thus been found to the difficult question of nationalities, a problem with which Stalin has particularly concerned himself. Nevertheless, the sovereignty of the federation over the constituent republics is uncontested. The same holds true of the dictatorship of the proletariat over the non-proletarian sections of the population as well as of the predominance of the Great Russian element. The latter predominates overwhelmingly in the R.S.F.S.R., which comprises nine tenths of the area and two thirds of the population of the entire Soviet Union.

Control of this gigantic federal state is centralized to the utmost degree through a system of administration which has preserved many of its old features as well as through the army and police (Cheka, later GPU), the dominance of the Communist party, the reorganized system of communications and the unified and centrally planned economic administration, similar in its state building character to the mercantilism of the seventeenth and eighteenth centuries and to the imperialism of the nineteenth and twentieth centuries. Federalism in Russia is not a mere sham; on the other hand, it is unable to assert itself freely and completely against the strong centralizing forces emanating from Moscow.

Regarding the actual machinery of government the Communist platform offered only general ideas. But there was already available the idea of the soviet (*q.v.*), which had been quickly improvised during the abortive revolution of 1905 and which, extended to include workers, soldiers and peasants, played a very crucial part in the series of events which brought the Bolsheviks into power in 1917. The new constitution adopted the soviet as the unit and instrument of government and provided that the state "is a republic of workers' and peasants' soviets."

The government functions through a hierarchy of soviets, the lowest of which, the village soviet and the city soviet, are elected annually by direct open vote of all citizens of both sexes who have reached the age of eighteen and who "earn their living in productive or communal work." Workers, officials, peasants and soldiers are thus permitted to vote; all others, particularly the remnant of the bourgeoisie and nobility, are excluded from the franchise. The lower soviets elect representatives to the next higher congress of soviets in regular succession. Greater weight is given urban than rural population by the fact that a smaller population per representative is prescribed for city than for rural areas: one representative for every 25,000 voters in the former and for every 125,000 in the latter.

The soviet principle thus results in a parliamentary democracy functioning on the basis of indirect representation, but exclusively for the proletariat. Although the elections are subject to the pressure of Communist dictatorship, this workers' democracy is not entirely a fiction. Moreover, while the power of Joseph Stalin as a controlling and directing force is tremendously far reaching it is not unlimited and is dependent on the party.

The old threefold czarist administrative division (*guberniya*, or province; *uyezd*, or county; *volost*, or district) is being replaced by a new twofold division drawn with a view to the natural economic unity of the different sections. The country is divided into economic districts coordinated with the requirements of the central economic plan and at the same time assuring dominance by the workers over the peasants. This fundamentally new division or "regionizing" is nearly completed. The R.S.F.S.R. now consists of twenty-two large administrative units (*oblast*), such as the Northern region, the Moscow Industrial region, the Central Black Soil region, the Ural region, the Lower Volga region and the Siberian region. Immediately below the *oblast* now comes the *rayon*, of which there are 3221 in the entire union, and the autonomous cities, of which there are 125 in the entire union. Below these are the other cities and the village soviets.

At the top of the hierarchy of soviets is the Congress of Soviets of the U.S.S.R., the supreme legislative power of the union. It convenes only once in two years and for a comparatively short time; between sessions its functions are vested in the Central Executive Committee (TsIK), which holds three sessions a year. The TsIK

consists of two bodies chosen or confirmed by the Union congress, the Union Council and the Council of Nationalities, consisting of representatives of the constituent and autonomous republics. The TsIK elects a Praesidium consisting of twenty-seven of its members, which is the supreme governmental organ of the U.S.S.R. when neither the TsIK nor the All-Union Congress is in session. The TsIK chooses the Council of People's Commissars (Sovnarkom), the cabinet of the Soviet Union. It consists of a president, three vice presidents and fourteen commissars. The constituent republics also have their people's commissariats; in the case of the R.S.F.S.R. these are in part identical with those of the union. Attached to the Sovnarkom are the "executing committees," the Council for Labor and Defense (STO) and the State Planning Commission (see GOSPLAN).

The Supreme Court of the Soviet Union, which stands at the apex of the judicial system, hears cases of exceptional political importance, explains the constitutionality of judicial decisions and serves as a court of final appeal. There are provincial courts functioning as courts of appeal from the lowest, or people's, courts, which hear ordinary petty civil or criminal cases. The Unified State Political Administration (OGPU or, more commonly, GPU), which uses both uniformed and non-uniformed police, in practice has charge of much of the administration of justice. The GPU, successor to the Cheka, or "extraordinary commission to combat counter-revolution, speculation and sabotage," is attached to the Sovnarkom. The GPU makes arrests, conducts trials, which are for the most part secret, and passes sentence. While there is no appeal for retrial from a decision of the GPU, yet those convicted may call upon the TsIK for clemency.

The Soviet state may be said to be identical with the Communist party of Russia (see COMMUNIST PARTIES), which although it has on the whole not over 2,600,000 members (including the so-called candidates but not the youth organization Komsomol, which has about 3,000,000 members) fills all important government posts and increasingly rules the country by regulations and orders which may take effect directly and independently of the government and even upon the government itself. Every other party is illegal and only Communists or "non-partisans," who figure mainly in the lower soviets, are eligible for election. The press is exclusively Communist and rigidly censored.

While the Soviet administrative system has many features in common with that of czarist Russia, especially its looseness and the relative independence and far reaching autonomy of the village, it should be noted that the governmental structure is complete. It has been planned with a view to economic productive unity, and the shortcomings caused by the looseness of the system are offset by the control exercised from above as well as by the predominance of proletarian interests and their solidarity, which were given strong support even in the villages through collectivization.

The system of administration requires an enormous bureaucratic machine, the number of government officials exceeding two million. The personnel consists partially of officials of the old regime, the so-called specialists, but in the main of a new administrative force developed by the Soviet educational system. The bureaucracy is controlled by the central government and is dependent on the party, but it includes a great many who are not party members. A civil service law and a pension law protect the status of the bureaucracy.

The whole machinery functions unevenly. The old failings of overorganization and irresponsibility are accentuated by the new shortcomings in the training and caliber of the administrative personnel. The press and the congresses are filled with discussions as to whether control is efficient and whether proper financial and business methods are being used. Particular attention is given to the problem of the village soviets, for it is on these that the proper functioning of the administration and much of the success of the Five-Year Plan depend. The village soviets are assigned administrative tasks of great importance in such matters as agricultural production, budgeting, control, road building, education and mass propaganda.

While the satisfactory solution of all these problems still lies far in the future, the system reaches each individual throughout the entire country, particularly with regard to taxation and military service, drawing him into its circle and educating at least the worker, to whom it opens a path of advancement in the administration, for participation in the work of state and self-government. The impact of the socialist ideal and the gigantic economic plan upon the individual is tremendous as far as the development of broad socialmindedness is concerned. Also tremendous, however, is the economic pressure which hampers the satisfactory solution of administrative

tive problems. The freedom of the bureaucracy and the police continues to be far greater than that of the people themselves under this dictatorship which seeks ultimately to insure the safe existence and normal functioning of a proletarian socialist state.

OTTO HOETZSCH

See: GOSPLAN; SOVIET; RUSSIAN REVOLUTION; BOLSHEVISM; COMMUNIST PARTIES.

BALTIC STATES. The territory now comprising the republics of Estonia and Latvia was acquired by Russia by the Treaty of Nystad of 1721, under which the duchies of Estonia and Latvia became *gubernii* of the Russian Empire. Most of what is now Lithuania and much of present day Poland were secured by Russia through the triple partitions of the kingdom of Poland and grand duchy of Lithuania in 1772, 1793 and 1795; the territory so acquired was reorganized into ten *gubernii* and the provinces of Congress Poland. To Austria there fell, through the dismemberment of Poland, the whole of Galicia—the sole foyer in which Polish nationalism was later vouchsafed any effective opportunity for political expression—while Prussia obtained the territories, including the now famous corridor, necessary to connect East Prussia with her other domains. Prussia also acquired a small part of Lithuania proper in the hinterland of the city of Memel. Austria found it politically imperative, especially after 1867, to link Polish nationalism in so far as possible to the fortunes of the Hapsburg dynasty. After purchasing the loyalty of Polish representatives in the Austrian parliament through the extension of autonomy to Galicia the Vienna government followed a *laissez faire* policy and attempted no conscious denationalization. Prussia, finding the Poles singularly unassimilable, resorted to divers measures intended to effect linguistic denationalization but relied primarily on economic pressure, such as the expropriation of Polish owned lands for the establishment of German settlers. These measures sufficed neither to check the Polish language nor to break the strength of Polish economic organizations; they served, however, to create lasting resentment and to fuse all Poles into solidarity against their German masters. In Russian Poland after the insurrection of 1863 even the name of Poland disappeared from the map and the western portions of the Russian Empire were officially designated as the Baltic provinces, northwestern provinces and the Vistula region. The czarist government continually

sought to efface in the western borderlands all traces of ethnic consciousness.

But while ruthlessly repressing manifestations of native nationalism Russia dealt leniently with the upper classes of magnates, merchants and noblemen, particularly in Estonia, Livonia and Kurland, which were aptly described as aristocratic German republics in Russian territory governing native non-Russian and non-German peasantry. Within the framework of official imperial administrative machinery in the three *gubernii* diets of the nobility ruled by historic right and imperial permission the private life and activity of the subject populations; in Lithuania and Poland the leaden hand of a Russian bureaucracy weighed heavily upon both bourgeoisie and peasantry. Deliberate retardation of the western borderlands was a cardinal principle of the old autocracy.

With the outbreak of revolution in Russia in 1905 the border provinces were particularly restive and insistent on forcing their demands upon the government at St. Petersburg, but restored liberty through revolution came to the Balticum only fragmentarily. Linguistic and literary repression and denationalization ceased and strong nationalist movements, previously illicit, emerged. For a brief season, while the Duma was on trial as an instrument for the reformation of Russia, the border nationalities had the opportunity to voice their demands for wide cultural autonomy on a quasi-democratic basis within the legal framework of the Russian state. But with the reduction of their representation in the Duma by the electoral manipulations of Stolypin in 1907 hope of effective representation of national movements within the political institutions of the Russian Empire quickly faded.

To the border nationalities the outbreak of the World War meant the opportunity to alter the major relationships of power in eastern Europe so as to permit the acquisition of autonomy—possibly independence. Although the Poles were the first to take action, the other nationalities were not long in seeking ways and means of establishing contacts abroad and working on public opinion. Even before the collapse of czarism volunteer citizens' committees covertly organized national councils. But to no nationality was freedom given before the house of Romanov fell. With the March revolution centrifugal tendencies immediately made themselves manifest in the borderlands. To only one of these, Estonia, did the provisional government

concede home rule—on April 12, 1917. Similar demands by Lettish and Lithuanian nationalist leaders were refused, while Poland was early promised an independence which the provisional government was unable to make effective.

After the Soviet government assumed control the border provinces were not long in drawing the implications of Bolshevik theory. The Declaration of the Rights of the Laboring and Exploited People enunciated the doctrine of the right of peoples to self-determination, even to separation from the state of which they form a part. Finland on December 6, 1917, Lithuania on February 16, 1918, Estonia on February 24, 1918, and Latvia on November 18, 1918, declared their independence of the Russian Empire, while Poland acted on the assumption that the policy outlined by the provisional government had given a priori consent to resumed independence of a Polish state. In the treaties of peace eventually signed by each of these countries with the Russian Socialist Federal Soviet Republic the formula of self-determination is given explicit confirmation.

In attaining full status as independent states the republics passed through four distinguishable stages. The first was a period of striving for autonomy, dating from the March revolution to the declarations of independence. It was characterized by meticulous and incessant quarreling with Petrograd, indicative of the progressive dissolution of legal and constitutional ties. The second embraces the struggle for independence, from official severance of connection with Russia to effective establishment of the authority of the provisional government in each instance. It was in the main a period of foreign war, intervention and blockade followed by peace making. The third was the stage of constitution making, accompanied by far reaching social reforms, a period of political and social stock taking, marking the endeavor to cast apparently plastic peoples into the democratic mold. It closed with the adoption of permanent constitutions, which opened the fourth period, indicative of the beginning of a new era of normalcy in the life of each particular country. The actual framework of government has in each instance resulted from a conscious adjustment of institutional machinery to the requirements of a new social order still in process of change.

Estonia. Political authority in Estonia lies, according to the constitution of June 15, 1920, in the hands of the people acting either directly

or through the State Assembly. The Assembly is a unicameral legislative body of one hundred members chosen by universal, equal, direct and secret suffrage of all citizens over twenty years of age under a list system of proportional representation. The term is three years, but the Assembly may be dissolved following the rejection by referendum of the people of a bill enacted by it. In addition to its legislative functions the Assembly elects the head of the state, confirms cabinets and accepts their resignation, controls public finances through a State Control, elects the members of the State Court of Justice, ratifies treaties with foreign powers and makes fundamental decisions respecting mobilization, declaration of war and conclusion of peace. Since the people can impose their will only through initiative and referendum and no other agency may influence the Assembly's decisions, it is evident that the power of the Assembly is very extensive. A referendum has been invoked only once in the history of the republic.

Executive power is vested in a head of the state, or minister-president, chosen by and from the State Assembly and holding office so long as he enjoys the confidence of that body. His position as the chief mandatory of the people fuses in a single person titular and actual executive authority. For all practical purposes, however, the government is collegial and the cabinet, of which the head of the state is chief, is responsible for the administration of the country. The Estonian Constituent Assembly expressly rejected a separate titular presidency and fused two offices into one for reasons both of principle and economy, creating thereby a distinctive situation intermediary between the fully collegial executives of Russia and Switzerland and the less powerful chancellorships of the German and Austrian republics. By a law of March 19, 1929, the head of the state was specifically vested with the prerogatives which international law accords to a chief of state. The actual administration is confided to the State Chancery and the different ministries.

To guard against such oppression as the people had suffered under baronial rule and czarist administration the constitution enumerates an elaborate bill of rights, including special guaranties of cultural autonomy to racial, religious and linguistic minorities. These have been amplified by subsequent legislation, particularly for German and Jewish minorities. The enforcement of the bill of rights is primarily entrusted to the courts.

The Estonian judiciary comprises one State Court of Justice, located at Tartu (Dorpat) and organized into civil, criminal and administrative divisions, a Court of Appeals at Tallinn and four courts of peace, which act as courts of first instance on more serious cases and as courts of appeal from the justices' courts found in every district of the country. Judges of the highest court are elected by the State Assembly; those of subordinate courts are appointed by the highest court, which also exercises disciplinary functions over the judicial personnel.

For purposes of local government Estonia is divided into eleven provinces, each with its elective legislative council and a president chosen by that body. The provinces are further subdivided into large towns, boroughs and rural communes, each with a democratically elected council and an executive selected by it—a mayor in the towns and boroughs, a sheriff in the rural areas. Estonian law does not differentiate between the functions of local and state administration: all local government bodies are regarded as branches of the state government, enjoying extensive ordinance power on matters of general administration, finance, education, sanitation, labor, social welfare and communications. Within this system of extreme decentralization a very appreciable degree of intermunicipal and interprovincial administrative cooperation has been attained.

In general the Estonian governmental system attempts to adopt and carry into effect among a highly literate, democratic people many of the conceptions of political democracy found in America and Switzerland, thus supplanting the tradition of czarist centralization and baronial domination. In more than a decade of actual operation no formal changes have been made in the constitution, although a strong demand for a separate presidency has been voiced.

Latvia. Unlike Estonia, whose provisional regime was quickly liquidated, Latvia took a longer period to enact its constitution. Not until February 15, 1922, was its fundamental law sanctioned by the Constituent Assembly. The instrument followed in its main lines the pattern of the Estonian constitution, save that it instituted a presidency. It was thought by the Constituent Assembly that an independent presidency with ample moderative powers for use in emergencies would form the most adequate safeguard against the abuse of power by a potentially tyrannous assembly. In the Latvian constitutional system titular executive power is

exercised by a president of the republic, elected by the majority vote of the members of the Saeima for a term of three years and once re-eligible, while actual executive authority is exercised by the prime minister and his cabinet, who are both individually and collectively responsible to the Saeima and must resign if that body withdraws its confidence. The president is endowed with power to propose legislative measures on his own initiative; to suspend temporarily for reasons given in writing the operation of a law with which he does not agree, subject to overriding or acceptance of his views by the Saeima; to defer the operation of a statute pending a referendum; and to propose the dissolution of the Saeima. In the latter event the people must decide between the president and the legislature: if the president is upheld the Saeima is automatically dissolved; if his proposal is defeated he must forthwith resign. In actual practise the president, being elected by the parliament, has been able to keep sufficiently in harmony with the legislature to avoid an open conflict. In most other respects the presidential office and the prerogatives attached to it harmonize with typical western European constitutions. The cabinet system is likewise similar to that of most democracies. The actual work of administration is entrusted to the nine ministries and to the state comptroller, who is elected by the parliament for a term of three years.

The Latvian Saeima is a unicameral body of one hundred members elected under a list system of proportional representation by equal, direct and secret suffrage of all citizens over twenty years of age in full enjoyment of civic rights. Its term of office is three years unless dissolved earlier by the people at the instance of the president. The Saeima has the usual prerogatives of a parliamentary body, legislative, fiscal, electoral, inquisitorial, together with some control, through twenty permanent commissions, over foreign affairs, the declaration of war and the making of peace and the appointment of judges.

In organizing its judiciary Latvia closely followed Estonian models. It abolished the distinction between local and national judges and instituted an integrated judiciary with justices of the peace as magistrates of first instance for most matters; four collegial district courts for more serious offenses, both civil and criminal, and for the revision of judgments of the justices' courts; a Court of Appeals at Riga to deal with complaints from the district tribunals; and a

judicial Senate, sitting at Riga, as a final court of cassation and supreme administrative court. Despite constitutional provision for the use of juries implementing legislation has not yet been enacted. No separate administrative courts exist, as both justices' and district courts consider ordinary and administrative cases.

For purposes of local government Latvia is divided into four provinces—Kurland, Zemgalia, Livonia and Latgalia—which are further subdivided into nineteen districts, each including a principal city, and 524 communes. There are elective district and town councils.

Lithuania. In establishing its permanent constitutional structure under an instrument of August 1, 1922, Lithuania followed closely the examples of its immediate neighbors, Latvia and Germany. Choosing from the former the presidential republic, the unicameral legislature, the system of state control over expenditure, the initiative and referendum and the principles of local self-government and judicial organization, it consciously selected from the Bill of Rights and Duties of the Weimar constitution the principles it found most applicable in relation to the organization of agrarian democracy.

From 1922 to 1926 this constitutional regime functioned under an elective Seimas, responsible ministries, freely elected presidents and an autonomous local government administration. Having guaranteed in the constitution the minority rights to which it subscribed at Geneva, Lithuania gave to its Jewish, White Russian and Polish populations full representation in parliament. After the elections of 1926 a government of the Left parties (Socialist and Populist), supported by the minority groups, replaced the Christian Democratic and Nationalist factions theretofore dominant. After six months of minority government a coup d'état was effected by the army and the extreme Nationalists in December, 1926. The president was deposed, a government commanding a majority in the Diet was evicted, a rump Diet was forced before its dissolution to accept a Nationalist cabinet, and the government of the country was left in the hands of Augustinas Voldemaras, a rabidly anti-Polish Nationalist leader.

In the course of a three-year personal dictatorship without benefit of legislature Voldemaras reshaped certain of the basic institutions of Lithuania, the changes being crystallized in the new constitution of May 15, 1928. Foremost among these were the substitution of popular for parliamentary election of the president, the

lengthening of the term to seven years as in Germany and the endowing of the president with power to issue decree laws during the intervals between sessions of the Seimas. With the resignation of Voldemaras in 1929 the period of personal dictatorship passed, but in contrast to the power given to the Seimas under the original constitution the new instrument heavily favors presidential government. At the present time the president issues laws drafted by an appointive Council of State, approves the budget and ratifies treaties. In the absence of a Seimas he and the ministers, whose acts are technically his, hold the totality of state power. In actual working there has been little incursion of the personal will of the president into the administration of the affairs of state. Independence of any legislative body, but not autocracy, has been the guiding consideration of the Nationalist dictatorship. If Seimas elections are eventually ordered they will take place under universal, equal, direct and secret suffrage with proportional representation—a feature left intact by the coup d'état and the dictatorship; only citizens above twenty-four years of age may vote and only persons over thirty may be candidates for the Seimas, whose term has been lengthened to five years. While provision is made in the 1928 constitution for both initiative and referendum, the absence of a legislative body makes organized political activity rather futile. In Lithuania in default of parliament newspapers play an unusually great role in molding public opinion.

Lithuania is divided into twenty administrative districts, which conduct the local activities of the state administration. The district and communal assemblies, freely elected on the same basis as the Seimas, did not undergo legal change as a result of the coup d'état, and local government functions normally throughout the republic.

The courts have likewise been unchanged by the dictatorship. Following the passage of the constitution of 1922 a Supreme Court, the highest civil, criminal and administrative tribunal and a court of impeachment as well, was created to pass on appeals from both the district and justices' courts. Justices of the peace are provided in every district and town of more than 20,000 inhabitants. Jury trial has not been introduced. Pending the elaboration of new codes by the Council of State the pertinent parts of the old Russian codes apply unless they have been expressly modified by statute or constitutional provisions.

By action of the Conference of Ambassadors on February 16, 1923, in pursuance of the Treaty of Versailles, the territory of Lithuania Minor, formerly a part of East Prussia, with its administrative center at Klaipeda (Memel) was assigned to Lithuania. Under the terms of the so-called Memel Convention of May 8, 1924, and its annexed statute the territory is administered as an integral but autonomous part of the republic subject to safeguards for the pre-vaillingly German population. The administration consists of a governor appointed by the president of the Lithuanian Republic, a Directory of five members and a subordinate staff. There is a democratically elected territorial Diet of twenty-nine members, to which the Directory is responsible.

Poland. Following the reunification of Poland a Constituent Assembly passed in February, 1919, the Little Constitution, both short and obscure, regularizing pro tempore the relations between itself, the government and the chief of state, Marshal Pilsudski. On March 17, 1921, it passed a permanent constitution establishing a democratic republican regime with a weak presidency, noteworthy parliamentary ascendancy, rigid control by the Sejm, or Diet, over the cabinet and judicial enforcement of individual guaranties under the Bill of Rights. A septennial presidency based on election by the joint meeting of both chambers acting as a National Assembly, a centralized system of local administration through voivodes (prefects) and starosts (subprefects), an elective Senate and an omnipotent lower house and a complex set of ordinary and administrative tribunals all indicate the borrowing of Poland from the constitutional practise of France. The system of multiple, rapidly disintegrating parties in a Diet of 444 members was an inheritance characteristic of the divided mentality of thrice partitioned Poland. Chronic ministerial crises, budgetary instability, dubious loyalty of minority groups, characterized the operation of the parliamentary system. The first president, elected by a fortuitous coalition of the Left parties and the national minorities, fell victim of a Nationalist assassin's bullet in December, 1922; his successor, a man of more conservative stamp, maintained his position largely by capitulating to the intrigues of parliamentary leaders. By 1926 Poland seemed on the verge of permanent parliamentary instability.

It was under these circumstances that Marshal Pilsudski, emerging from political retire-

ment, marched his legions on Warsaw and evicted the constitutional government. In its place a chastened Parliament confirmed in office a hand picked following of Pilsudski and elected to the presidency Professor Ignacy Moscicki, an intimate friend of the marshal. Shortly thereafter the Diet gave constitutional effect to the coup by amending the instrument of 1921 to enhance markedly the powers of the president over the legislative body, granting him rights to dissolve the Diet at discretion and issue decree laws between its sessions. This stabilized the situation, and Poland continued under Pilsudski to function as a parliamentary republic in appearance, although in fact the Diet was drastically curtailed in its powers and government was a veiled dictatorship by the marshal. In August, 1930, the long smoldering constitutional quarrel between the dictator and the Diet broke out anew and Pilsudski, assuming the premiership, dissolved a Diet with which he could not cooperate and contrived to procure the election in November of a much more submissive body.

In March, 1931, proposals were laid before the new Diet to amend basically the 1921 constitution by providing for direct election of the president, the people being limited to a choice between a candidate named by the Diet and one named by the outgoing president. In addition the president would be endowed with a far reaching ordinance power, with the right to convoke and dissolve Parliament, veto laws passed by it, appoint ministers, judges and one third the members of the Senate and sign and ratify treaties without the consent of Parliament. He would thus become a constitutional autocrat, centralizing executive authority in his person and dominating both legislative and judicial branches. A compromise between a responsible ministerial system and true presidential government stipulated that the cabinet would be responsible to the president, not the Diet, although the Diet would be able by majority vote to force the resignation of the government. Although differing appreciably on paper from the constitutional regime of 1921 the changes proposed appear to do little more than sanction the existing relations between the principal public authorities in Poland.

The proposed amendments in no way touch the local governmental system or the courts. Despite official constitutional provisions local government is still largely based on preexisting local legislation—Austrian in Galicia, Prussian

in Poznań and Pomerania, Russian in Congress Poland and the eastern districts. The country is now divided into sixteen voivodeships, each subdivided into districts, which are again subdivided into urban and rural communes. In former Prussia and Congress Poland communal and district local government is symmetrically developed, democratic elective councils and local magistrates having comprehensive powers over local administration; in former Austrian Poland, with large Ukrainian populations, an antidemocratic four-class system has supplanted the three-class electoral system of Hapsburg days; in the eastern districts no communal assemblies exist and district assemblies are made up of delegates of the communes. Assemblies for the voivodeships have not yet been fully introduced, hence only the central administrative authorities actually function. Municipal administration is more developed and closely approximates western European standards.

Judicial administration, left by the constitution to legislation, is wholly the product of presidential ordinances representing a high development of modern juridical practise. An ordinance of February 6, 1928, establishes elective justices' courts in the countryside and appointive police courts in the municipalities to care for minor cases, district courts as tribunals of first instance for both civil and criminal cases, eight courts of appeal and a Supreme Court at Warsaw, whose members are named by the president of the republic. The latter court has final power of cassation, a wide latitude in judicial discipline and a limited power of constitutional interpretation. Poland thus far is the only one of the Baltic countries to introduce the jury system.

SUCCESSION STATES. The succession states are those which were created or materially enlarged through the dissolution of the Hapsburg monarchy after the World War. The term generally includes Austria and Hungary, which were entirely within the monarchy; Czechoslovakia, which was almost entirely carved out of the monarchy; and Yugoslavia and Rumania, of whose present areas 61.6 percent and 42 percent respectively were included in the Dual Monarchy. The considerable territory obtained by Poland through the dissolution had belonged to the monarchy for a relatively short period of time, and the territory obtained by Italy was relatively insignificant in area.

The common characteristic of the succession states is not racial or linguistic but historical. The countries and peoples placed between Germany and Constantinople have since the development of the Byzantine Empire been influenced mainly by two quite divergent cultural currents. From the northwest the German-Roman state offered German and western Christian culture; from the southeast Byzantium provided a Grecian and Orthodox Christian culture. The former used the Latin language for its legal and church communication and the Latin alphabet for writing; the latter in its proselytizing work used the old Bulgarian language and the Cyrillic alphabet. Byzantine culture spread as far west as what is now Czechoslovakia, and Hungarian Christianity is full of its traces. The effect of this struggle of cultures is found in the present distribution of the religions of the peoples of the succession states. In the west the Roman Catholic and Protestant religions predominate; in the east the Greek Orthodox and Mohammedan.

The great influence of Byzantine culture lasted until the fall of Constantinople; before that event the culture of the peoples of southeastern Europe was measured by proximity to Constantinople. After the successful advance of the Turks the situation was reversed. The direct influence of Byzantine culture ceased, but its importance remained and it was forced into the background only by the nationalistic ideas set in motion by the French Revolution. The historic mission of the Hapsburg monarchy was the protection and extension of western Christianity. At the head of the Holy Roman Empire, it led the west in its struggle against the east; under its sway papal influence was successfully extended during the eighteenth century to many of the peoples of the eastern territories. When the military power of Turkey had shrunk to such insignificant size that the people of the Balkans could successfully oppose it unassisted, as they did in the first Balkan War of 1912-13, the historic mission of the Hapsburg monarchy was fulfilled.

When there was no longer any danger of the penetration of Turkey into Europe the Hapsburgs undertook the unification of the peoples—ethnographically, culturally and religiously different—whom they had gathered under their sway in the course of their activity as the protectors of western civilization. The dynasty, the army, the aristocracy, the Catholic church and the bureaucracy all contributed to this strong centralizing, unifying movement. But it had

been begun too late. Nationalist feeling had already grown to conscious power, which rendered assimilation and unification impossible. The defeat of the empire in the World War finally loosed its unifying bonds.

The government of pre-war Austria-Hungary was based upon the *Ausgleich*, or Compromise, of 1867. Under it the monarchy was composed of two equal states, Austria and Hungary, each with a separate Parliament and government. The symbol of their union was a common ruler, called emperor in Austria and king in Hungary, who was required to be a Catholic of the Hapsburg-Lorraine family. Such mutual matters as foreign affairs and the army and the finances to cover their common expenses were arranged through delegations elected by each Parliament for one year and meeting alternately in Vienna and Budapest. The delegations deliberated and voted separately, communicating their decisions to each other in writing; in case of continued disagreement after three such interchanges a common session was held to vote but not to discuss. Three joint ministers, not members of either delegation, were appointed by the emperor to administer the joint affairs of the two countries. These ministers were required to be in general harmony with the delegations. The quota which each country was to contribute to the joint budget was to be decided every ten years; at the same time the customs and commercial agreement of 1867, which provided for free trade and a unified currency and excise tax policy throughout the area, was to come up for renewal. The charter of the joint bank of issue was also for the same limited term. Although these various arrangements were almost always regularly renewed until the advent of the World War, the time for renewal was frequently the occasion for considerable disagreement and bargaining for advantageous concessions.

The parliaments of both countries had two chambers. The upper house was composed of certain members of the aristocracy and the clergy and certain members appointed for life by the crown. The lower house was elected: the *Abgeordnetenhaus* in Austria, after 1907, by equal and secret ballot of all men over twenty-four; the *Képviselőház* in Hungary by open ballot, at which as late as 1912 only 24.9 percent of the men over twenty could vote. Election districts in Hungary proper were often very unevenly arranged. The non-Magyar population, fully half of the whole, was in 1910 represented by only eight members. The peasants and indus-

trial proletariat were not represented at all in the Hungarian Parliament. In both states the lower house had very limited power. The upper house held an absolute veto and the question of the monarch's consent was more than a mere formality. The government had to consult the monarch before proposing any measures. The monarchy was thus essentially absolute.

In the hierarchy of local government units in Austria the most vital and powerful were the seventeen provinces, which had preceded the state historically and which had the power to make and administer their own laws. Their sphere of authority was not clearly differentiated from that of the state and clashes were frequent. These conditions made Austrian public administration very chaotic. Austria had a very well trained and disciplined civil service. In Hungary the most important unit of local government was the *comitatus*, or county, which functioned for centuries as an almost autonomous republic of the lesser nobility or freemen possessing the hereditary franchise. This aristocratic institution has kept the spirit of local self-government alive, so that in the power of its local government Hungary exceeds many countries economically and culturally superior to it.

Social stratification differed in the two countries. The Austrian aristocracy was to be found among many nationalities and in many professions—the army, the diplomatic corps, the civil service and industry. In Hungary the aristocracy remained unified as the large landowning class. The Austrian middle class was richly differentiated and split up nationally; in Hungary it was much smaller and weaker, while a non-Hungarian middle class was merely embryonic. The peasants in Austria had no political independence, but their strength counted politically, which was not the case in Hungary. The industrial proletariat was larger and better organized in Austria, but even in Hungary it was the only social group which did not accept the social valuation established by the nobility. Religion was a much more important factor in Austria than in Hungary, where the proportion of Catholics was much smaller. In Austria all nations were equally accorded educational and linguistic rights; not so in Hungary. From 1867 the rights of nationalities increased in the former and decreased in the latter.

The kingdom of Croatia-Slavonia occupied a separate position in Hungary from the time of its annexation in 1102. The head of the administration in Croatia-Slavonia was the ban, who

was appointed by the king on the nomination of the prime minister of Hungary. Croatia-Slavonia had a separate government consisting of departments of the interior, religion and education and justice. The government was responsible to the Croatian Diet (*Sabor*) which, however, hardly represented public opinion. The Croatian people hated the alliance with Hungary as much as the Hungarians hated that with Austria.

With the break up of the monarchy each of the constituent states faced the problem of political and economic readjustment. All but Hungary proceeded to adopt written democratic constitutions, but only Austria and Czechoslovakia are real functioning democracies. In the latter country, however, as in Yugoslavia and Rumania, the existence of neutral or hostile national minorities who are opposed to the prevailing policy of centralization seriously hampers the functioning of the parliamentary system. Treaties and international agreements to which the states are a party control somewhat the treatment of minorities. Most of the states adopted far reaching measures for agrarian reform; large estates were broken up and the growing importance of the peasants was recognized and stabilized by giving them shares in the land. In the Little Entente states the compensation given the landlords came very close to being confiscatory; in Hungary the rights of the landlords were hardly changed.

Austria is now a federal republic composed of eight provinces and the city of Vienna, which has the status of a separate province. The government rests upon the constitution of 1920, modified and revised in 1925 and 1929. The legislature consists of two houses. The lower house (*Nationalrat*) is elected by vote of all citizens over twenty-one on the basis of proportional representation. The ministers are separately and collectively responsible to it. The upper house (*Bundesrat*) is elected by the provincial diets, the provinces being represented according to population. It has limited power. It can propose new laws only through the government. It cannot veto any measure passed by the lower house but it can suspend its operation for a period of eight weeks, after which if the same measure is re-passed by the lower house it becomes a law. The constitutional revision of 1929 proposed the conversion of the upper house into a body representing functional groups as well as the provinces, but the necessary constitutional amendments to effect this have not yet been passed.

The executive power has been increased through the various constitutions, so that from a purely parliamentary republic Austria has been changed into a semipresidential republic. The election of the president by direct popular vote, provided for in the changes of 1929, was abandoned in 1931 because of the expense involved; he is still elected by a majority vote of the two chambers, sitting together as the Federal Assembly. His term of office is six years but he is subject to popular recall on the basis of a proposal to that effect by a majority of the legislature. If the people defeat the recall proposal the legislature is dissolved, new elections are called and the president is considered to have been reelected for another six years. The president can serve only twice in succession. He summons the legislature and can dissolve it, but only once for the same reason. New elections must then be held within ninety days. He appoints the chancellor and on the latter's advice the other members of the ministry, and he dismisses the government. With the approval of the government he can issue emergency decrees, which become inoperative if not ratified by the legislature within certain definite time limits.

The constitution provides for a compulsory referendum for complete constitutional changes; for modifications only a two-thirds vote is necessary, but a referendum can be demanded by one third of the members of the *Nationalrat* or *Bundesrat*. The referendum can also be invoked on any law passed by the legislature. There is a provision requiring that any measure recommended by 200,000 citizens or one half the voters of any three provinces must be acted upon by the legislature.

Every province has its own diet (*Landtag*), which elects a provincial commission (*Landesausschuss*) corresponding to the ministry of the federal government. The provinces have strongly developed their powers and individuality. As in the United States, all powers not specifically granted to the federal government are retained by the provinces; agriculture, education and charity among others are thus retained. Vienna occupies a peculiar position as the largest province in population (it possesses almost one third the total population of the country) and as the capital city. Its uniqueness is aggravated by the fact that it has a very strongly developed socialist administration, which has entered actively into certain socialist legislation; for example, heavy taxes, the proceeds from which are used for the construction of huge garden housing projects

for the workers, have been levied on rents. The other provinces—conservative rural areas—are trying to restrict the governmental powers of Vienna; this attempt is hampered by the requirement of a two-thirds majority for constitutional changes and by the fact that the socialists are too powerful to be reduced to less than one third of the house. The power of Vienna was somewhat curtailed by the constitutional changes of 1929. The sharp difference of points of view has resulted in the development by both Right and Socialist parties of large armed semi-military forces, pledged respectively to the overthrow and the protection of the republic by force.

The citizens show "an amazing lack of will power to struggle along as an independent state" (Crane, John O., *Little Entente*, p. 133). The desire for *Anschluss* with Germany is very strong, although not equally powerful among all groups. The interest of any particular group in union varies with the dominance of different groups in Germany and the probable effect of *Anschluss*, under the existing dominance, upon the particular Austrian group. Article 88 of the Treaty of St. Germain as well as the terms of the pact with the League of Nations of October 4, 1922, for the financial reconstruction of the country forbids a union between Austria and Germany. In 1931 the World Court, by a five to four vote, ruled that the prohibition applied to the proposed customs union between the two states.

Hungary passed through two stages: a democratic republic under Michael Karolyi in 1918; and a Communist dictatorship under the leadership of Bela Kun in 1919, before reaction and counter-revolution brought into power the present forces—the aristocratic landowners and wealthy peasants, the financiers and industrialists, the bureaucrats and the antisemitic petty bourgeoisie. The new government did not evolve a new written constitution but restored the thousand-year old constitution and kingdom. Since it was not possible to restore the king to his throne, the National Assembly in 1920, following a fifteenth century procedure, elected Admiral Nicholas Horthy as regent. Legislation passed upon the insistence of the Little Entente, after the two vain efforts by King Charles to regain his throne in 1921, bars the return of the Hapsburgs as rulers of Hungary.

The Parliament consists of two chambers. The upper chamber, which was restored in 1926, is composed of hereditary and ex officio mem-

bers, delegates elected for varying terms by the former aristocracy, by the counties and cities and by scientific and economic institutions, and life members appointed by the regent. Since 1925 the franchise for the lower house is open to all men over twenty-four and all women over thirty, subject to educational qualifications which are more stringent in the case of women voters.

The free expression of the will of the people in elections is hampered by a number of devices and by government manipulation. Out of a total of 245 electoral districts only forty-six (including Budapest and the other cities) have the secret ballot. The signature of 10 percent of the voters in small districts or of 1000 voters in large districts is necessary for nomination. The wartime restrictions on civil liberty still prevail; the leaders of the radical groups consequently live outside Hungary. As a result of all these the same party and the same prime minister (Count Stephen Bethlen) remained in power from 1922 to 1931; a change of prime ministers in the latter year did not indicate any change in the ruling group. The political power of the large landowners is still stronger in Hungary than anywhere else in the world. The small peasants and agricultural laborers, comprising the majority of the population, are absolutely unorganized. The pressure of the state on the one hand and the lure of Bolshevism on the other weaken the economic and political organization of the industrial proletariat. Antisemitism has made headway among the city bourgeoisie, which with the landholders of all classes supports the government. The bureaucracy—state, county and village—belongs organically to the ruling class, as do the priests.

The pre-war system of local government remains practically unchanged. There are twenty-five counties and eleven municipalities, each with its own legislative body, one half (in the case of the municipalities two fifths) consisting of the highest taxpayers, the remainder of elected members. The vigorous aristocratic local government units are restricted only by the increasing state interference in local affairs. The civil service is perhaps not equal to that of Austria in education, effectiveness and discipline, but is far superior to that of Rumania and of Jugoslavia.

Czechoslovakia is a democratic republic whose government is based upon the constitution of February 29, 1920. Unlike Hungary, where the nationalist leaders were mostly noblemen and where nationalism was consequently not an es-

entially democratic movement, Czech national feeling is based upon a strong democratic feeling. This is due to the fact that in the struggle for national emancipation the aristocratic and wealthy classes always took a hostile or neutral attitude. The Czech middle class, led by the intellectuals, is the strongest advocate of nationalism, but even the Czech social democrats are not opposed to this democratic, freethinking, anticlerical nationalism.

The constitution was very much influenced by that of France. It established a bicameral legislature, consisting of a Chamber of Deputies of 300 members, elected for six years, and a Senate of 150 members elected for eight years. Every citizen over twenty-one may vote for the former and every citizen over twenty-six for the latter; proportional representation applies to both houses. The lower house has far more power than the upper. In normal cases the latter exercises merely a suspensive veto, which can be overruled by an absolute majority; if, however, the Senate overrules the lower house by a three-fourths vote of all its members, the lower house can repass the measure only by a three-fifths vote of all its members. The president's veto may be overruled by an absolute majority in both houses or by a three-fifths vote of all members in the lower house. Either chamber may initiate legislation, except that budget and defense measures must originate in the lower house. A standing committee of twenty-four (sixteen chosen by the lower house and eight by the upper) functions when the chambers are not in session.

The president is elected for a term of seven years by the two chambers meeting together as a National Assembly. A majority of the members must be in attendance and a three-fifths majority of those present is required for election; if no candidate obtains the required majority on the first two ballots, a third ballot is held in which only the two highest candidates are permitted to run. The constitution provides that no one can serve as president more than twice in succession. This does not apply, however, to the first president, Thomas G. Masaryk, whose personality has played an important part in the development of the new republic. He calmed the impatience of the Czech nationalists, persuaded the German minority to join the government and induced the legislature, which grew progressively more conservative, not to decrease the budget for social insurance.

There is not much local self-government in

Czechoslovakia despite the local government reforms of 1928. In Bohemia, Moravia and Silesia the right of local legislation had been taken away by the constitution of 1920; in the former Hungarian counties there is a strongly established tradition of self-government. The centralizing policy of Czechoslovakia, as of Rumania and Jugoslavia, was carried out against the wishes not only of the national minorities but also of a part of the ruling nationality, which was sympathetic toward federalism. Czechoslovakia is consequently faced by the problem of allaying the complaints of a number of minorities. The Slovaks complain of the excessive centralization, which is still strongly supported by the Czech carpetbaggers and the powerful Czech bureaucracy, and of the anti-Catholic spirit of the government, which offends the religious feelings of the pious Slovak peasant class. 750,000 Hungarians share the political views and aspirations of their nationals in Hungary. The Ruthenians, a backward peasant people, enjoy autonomy only on paper and complain of overcentralization and Czech bureaucracy. There are more than 3,000,000 Germans in the country; their proximity to Germany and Austria makes them potentially the most dangerous minority group, but their attitude toward the government is becoming less estranged and they have accepted representation in various cabinets.

The administration of public affairs and of justice in the old Austrian sections is equal to that in present day Austria; in the old Hungarian counties the standard is considerably lower and the bureaucracy is far from popular.

The cabinet has to rely upon the support of a coalition or bloc formed of several parties. The composition of the ruling bloc and consequently of the ministry changes very frequently. The weakness and instability of the cabinet constitute one of the important dangers which face Czechoslovakia.

Rumania before the World War was an independent kingdom. The constitution, drawn up in 1866, was modeled after that of Belgium and had little relation to the practical problems of Rumanian political life. Consequently Rumania's western form of government was purely on paper. In actual operation it was a country dominated by the political power of the large landed class, the boyars, who had used this power to retain a feudal hold over the peasants. The peasant was entirely unrepresented in the national legislature. The World War and the influence of the Russian Revolution seriously weak-

ened the power of the landed class; the fear of a Communist revolution forced the ruling class to accept the most radical agrarian reform ever put into effect outside of Soviet Russia. Furthermore, as a result of the war, Rumania secured from the monarchy, from Russia and from Bulgaria additional territory not only larger than its own original area but also in most cases more advanced culturally and economically. Governmental adjustments to take account of these changes were necessary.

A new constitution, embodying the most advanced democratic ideas, was adopted on March 28, 1923. A bicameral legislature is provided for, elections to which are regulated by the electoral law of March 28, 1926. The Senate consists of members by virtue of their office in the church and members elected by the voters, by the communal and provincial councils meeting together in each province, by commercial, industrial, agricultural and labor organizations, and by the universities. The lower house has 387 members, elected according to a list system of voting which gives 60 percent of the seats to the party casting 40 percent of the votes. Only male citizens may vote: those over forty in Senate elections, those over twenty-one in lower house elections.

The king or either chamber may initiate legislation, but measures referring to finances and the army must come first before the lower house. The king may prorogue or dissolve the legislature and has a suspensive veto over legislation. As head of the executive division he nominates all ministers. Control of the machinery of public administration and of elections usually insures the government against defeat in an election. It is doubtful whether the peasants, who are the largest element in the country, will be able, without the necessary experience, to handle the machinery of a parliamentary democracy. Over half of them are illiterate; all are politically untrained.

The administration is marked by overcentralization and bureaucracy; legislation passed in July, 1929, aiming at decentralization and more local self-government, is inoperative. The civil service is on a much lower plane than in the Hapsburg monarchy, but corruption is not an institution as it was in czarist Russia. There exists a certain democratic spirit which finds its most concrete expression in a relatively free press. Centralization, the inefficiency of the Rumanian bureaucracy as compared with that of the old Austro-Hungarian monarchy, and the cultural and economic superiority of the greatest

part of the added territories tend to create dissatisfied minorities which seek union with their own national states. The minorities represent about one fourth of the population, but their importance exceeds their number because of their superior cultural and economic level.

Jugoslavia was formed about the kingdom of Serbia as a nucleus. The latter before the World War was a democratic peasant state. It had a unicameral legislature and the king was often emphatically reminded, sometimes by force of arms, that the constitution was more than a mere form. Every male over twenty-one who paid a tax equivalent to about three dollars could vote. Four centuries of Turkish domination had destroyed the aristocracy and the agrarian proletariat was small. Culture and wealth were represented by a handful of academicians and merchants. In its polity, spirit and ethics the society resembled a characteristic frontier society. The kings were not imported from other countries but came from the peasant class. Conditions were similar in Montenegro, which was united with Serbia immediately after the war.

But the territories which were annexed as a result of the war upset the uniform character of the peasant democracy. Slovenia contributed a peasant group which was law abiding, well disciplined, thrifty and well educated by Catholic priests. Croatia was a miniature of the aristocratic Hungarian society; the long political connection with Hungary had taken away its capacity for political independence. The Hungarian and German peoples living in the rich and fertile Voivodina created additional national problems. Dalmatia was economically one of the most neglected states of Austria. In Bosnia and Herzegovina the Mohammedan influence was very strong. In the south Serbian or Macedonian and southwestern Albanian provinces economic conditions were similar to those of the Middle Ages and political problems were still settled by violence.

The question of centralization versus federalism was bitterly fought in the discussions preceding the organization of the new state. The constitution of June 28, 1921, drawn up by a convention controlled by the Serbs, instituted a centralized government. It provided for a parliamentary "constitutional and hereditary" monarchy with a unicameral legislature elected by all male citizens over twenty-one on the basis of proportional representation. Since the institution of the new state every government, driven by the aspirations of the dominant Serb group,

has attempted to construct a state as unitary as France. The centralization movement has met with tremendous opposition. The principal opposition comes from the Croats and represents the passive resistance of a society with an aristocratic tradition and a Catholic education to the violent nationalism of a successful democratic society. The struggle of the forces of centralism and federalism deadlocked the government and led King Alexander on January 6, 1929, to establish a dictatorship to achieve by force what parliamentary government had failed to secure. The title of the country was changed from Kingdom of Serbs, Croats and Slovenes to Kingdom of Yugoslavia and the old provinces were wiped out and replaced by nine new administrative areas, or *banats*, administered by governors appointed by the crown. With the task of centralization still unaccomplished, King Alexander on September 3, 1931, formally abolished his dictatorship and presented the country with a new octroyed constitution—at least formally a constitution. It provides for a parliament of two houses. The Senate will be composed half of members elected by the people for a term of six years, half of members nominated by the king for life. It will be secondary to the lower house, the *Skupština*, which will be entirely elective, its term of office being four years. Parliament is granted full rights concerning the budget, debate, interpellation and ministerial control. The *banats* and municipalities are accorded considerable autonomy. Universal secret ballot for citizens of both sexes over twenty-one is provided for. In the *Skupština* elections of November, 1931, however, there was no secret ballot, only party candidates could run, and only such parties could participate as could obtain eighty signatures in every single electoral district. Since all Yugoslavian parties are regional and not national, only the government's newly founded State party could satisfy the requirement. Although in most districts there were two or more candidates, they were all members of the State party. The electors were practically forced to vote in the election. The new system seems to be a desperate attempt to save centralization by a show of constitutionalism.

BALKAN STATES. The Balkan peninsula has no absolute geographical boundaries; the question of its extent is a matter of political relationships

as well as of geography. Traditional usage would tend to include all of Rumania, Yugoslavia, Bulgaria, Greece, Albania and Turkey in Europe. But since much of the territory of the first two countries belonged to the former Austro-Hungarian monarchy and since their membership in the Little Entente indicates a changed political orientation, their governments are treated in detail in the section on SUCCESSION STATES. Furthermore, since most of Turkey's territory and population lie outside of the peninsula, its government is treated in detail elsewhere (see section on TURKEY).

The peninsula is inhabited by the most intricate intermixture of races to be found anywhere in Europe. The result is an extremely complex minorities situation, the danger of which is intensified by the aggressive nationalism which in each country urges the denationalization of all minorities within its own boundaries at the same time that it protests against similar treatment of its own nationals in other countries. The minorities question, which finds overt expression in the activities of such quasi-military organizations as the *Comitadji*, contributes more than any other single factor to the extreme instability of Balkan political relations and to the intense and severe rivalry and hostility between the neighboring peoples.

Yet despite their differing languages and conflicting aspirations the people singularly and strikingly resemble one another even to the clothes they wear, the songs they sing and the food they eat. All have been subjected to the operation of three powerful forces: Byzantine culture, Turkish despotism and a peasant economy. One of the parents of Byzantinism was Greece in her decline; the other was Constantinople or the Orient. The Byzantine method of thought and conduct and its outlook on life found their best expression in the Eastern Orthodox church and their worst in Phanariotism. These two institutions worked hand in hand and were manifestations of the same force, essentially oriental, mystical, emotional and decadent. They rested on oligarchy, thrived on corruption and privilege and maintained themselves by means of duplicity, venality and oppression of the masses. Their symbols were ostentation, luxury and splendor for the few and vast wretchedness, squalor and ignorance for the many. When the Turks invaded the Balkan peninsula in 1356, occupied all southeast Europe and held much of it for five centuries they did not put an end to Byzantinism but rather reenforced its worst ele-

ments by an infusion of Turanian brutality and lethargy.

The Balkan peoples are very largely peasants, characteristically timid, ignorant, backward and poorly organized. Consequently in every Balkan land the town and city intelligentsia, the merchants, small industrialists and bankers run the state, usually for their own benefit. Weak and spasmodic social control enables the parties in power to become arrogant and corrupt. The state is a machine for giving the dominant politicians as many favors as the peasants will stand without actually revolting. Elections are a device whereby the governments fortify their position as the dispensers of privilege; rarely are governments voted out of office.

Practically all the Balkan states are alike in the genesis and structure of their governing machines. All of them came into being in consequence of a long series of revolts against the Turks brought to successful conclusions by rebel heroes aided by interested foreign powers, primarily Russia. Violent opposition and revolt have consequently long been accepted forces in Balkan political life. The most popular leaders are insurgents, and revolutionary methods and direct action are held in high esteem. Unsettled international relations have elevated patriotism to the chief national virtue, and the constant atmosphere of latent war has made the warrior the principal hero and has prevented frank criticism and democratic control. To reveal and denounce the corrupt and illegal acts of the governments in such a situation become acts of treachery. Under such circumstances the military element exerts a dominant influence; it is the powerful irresponsible factor behind Balkan governments, directing parliaments and governments and utterly frustrating the free expression of public opinion.

In almost every case the rebel heroes, having achieved national liberation, have written very democratic constitutions which strictly divide the functions of the state into the three classical branches and attempt to insure administrative efficiency, legislative independence and judicial impartiality. Actually, however, they have generally established semidictatorial forms of government. Sometimes they have themselves become the heads of governments, as in Serbia and Turkey; at other times, as in Rumania, Bulgaria and Greece, they have worked through imported kings. In Albania both methods have been tried. When the rebel hero becomes king or president, absolutism is complete; when he hides behind a

parliamentary king, royalty usually has a hard time of it. Balkan kings are always in vehement conflict with the leading politicians; in most cases they are beaten in the struggle. Albania during the short period of her existence has experienced several violent changes of government, and the present king guards his throne by force. Greece has constantly hectored her kings and killed or expelled them all, except one who died tranquilly of a monkey bite. Bulgaria forced her first two sovereigns in modern times to abdicate. The Serbs killed or drove out most of theirs. In Rumania docile kings have lent pomp to the absolutism of gifted politicians.

Generally speaking, Balkan governments are personal, representing the semi-absolute control of a few strong men. Government has been synonymous with the Bratianus in Rumania, Pashitch in Serbia, Stambuloff and Stambolisky in Bulgaria, Kemal in Turkey, Venizelos in Greece, Zog I in Albania. These rulers have been or are patriarchal bosses, democratic executives in the sense that they did or do represent some dominant group, usually the awakening townspeople, the advancing industrial classes, the clerical and professional groups.

As the village masses become more enlightened, vigorous peasant parties are formed and precipitate a new sort of socio-politico-economic struggle, which is coming to dominate the Balkans more and more. The intelligentsia and city élite, those who own the newspapers, control the schools and universities, write most of the books, manage the banks, direct the newly formed industry and command the army, are forced into a defensive position; they must fight with ever growing fury and brutality to maintain their ascendancy. The hero bosses from the peasant ranks have not as yet been able to gain or keep the upper hand. They are killed off, like Stefan Raditch in Croatia and Stambolisky in Bulgaria. But peasant hordes continue to storm the bourgeois citadel; the vehemence of their onslaughts is accentuated by an agrarian crisis. Although still easily defeated their swarms cannot be kept back forever.

Fundamental political differences between political parties do not usually exist in the Balkans. Loyalty to chieftains and appetite for spoils are the dominant forces. There is, however, a general line of cleavage which separates one group of parties from the other. In Bulgaria the battle line finds the peasants, reinforced by the communists, on one side and all the white collar people on the other. In Greece it is roughly re-

publicans against monarchists; the more vigorous, energetic and progressive new refugees settled in newly created villages in the recently annexed northern parts of the country against those who have inhabited the peninsula for two millennia. In Albania the government of King Zog represents the domination of the new bourgeois and intellectuals over the old landowning beys; high handed treatment of opposition chiefs, however, makes the expression of articulate partisan activity dangerous. Despite theoretic restraints and constitutional safeguards personal liberty is not secure in any Balkan land. Recent years have, however, brought some improvement in this matter. Although patriarchal dictatorships persist, unquestioned advance toward effective democracy is being made.

In every Balkan country the achievement of independence was followed by the liberation of the local Orthodox church from the control of the Byzantine patriarch at Constantinople and the founding of new self-governing national churches. In each case the church has been controlled by the government and employed to further national interests and to oppose such social and political movements as agrarianism, socialism and communism. In Albania, the only European state with a predominantly Moslem population, little antagonism exists between the religious faiths; Orthodox and Catholic Christianity cooperate with Mohammedanism in the service of king and state.

Bulgaria is a state about the size of Ohio, with a population of approximately 5,500,000. It obtained autonomy under Turkey as a result of the Treaty of St. Stefano in 1878 and successfully asserted its independence after the Young Turk revolution in 1908. It is a constitutional monarchy with a hereditary king and is governed by a council of ten ministers, who derive their power from and answer to a single legislative body (*Sobranje*) of 273 members, elected every four years by all the adult males. Voting is secret with many safeguards; nevertheless, there is considerable management of elections by the government. The press is usually free for most people except communists. The courts are just and fairly expeditious; judges cannot be dismissed or transferred by politicians.

The country is divided into sixteen departments, or prefectures, and eighty-two subprefectures, which are administered by officials appointed by the central authority. The prefectures also have local elective parliaments or councils managed by permanent executive committees.

Local autonomy, inaugurated by village and town leaders in 1878 as a safeguard against the continued Turkish control, continues to function rather effectively. Practically all officials in the villages, towns and cities are elective, as are the church and school trustees. The clerk of the commune is appointed by representatives of the central government; he must meet an educational requirement and is usually a permanent functionary. Most of the social institutions in the country are locally created, but a strong centralizing movement is in process. The school system, youths' organizations and sports are strictly controlled by the central authorities. Bureaucracy is a paralyzing national vice. Expensive infant industries are the pet of the state, but a good deal is also being done for the peasants. There is much communal land and all subsoil wealth as well as most of the forests belongs to the state.

Greece won its independence from Turkey as early as 1829. The decisive defeat of 1922 at the hands of the Kemalists has led it to abandon, at least temporarily, its long attempt to create a Greece coextensive with the boundaries of ancient Hellas. The country now has an area of about 49,000 square miles, approximately the size of Louisiana, and about 6,400,000 inhabitants. It is not as well suited to agriculture as Bulgaria; it carries on a much more extensive trade, always showing a large yearly deficit; it is more influenced by western European culture, which ancient Greece helped create; it has cleverer statesmen with more prestige in Europe and is more dominated by men of wealth and western ways. In many respects it is the least oriental of Balkan lands.

It has been a republic since 1924, when by a decisive popular vote it dismissed its last king. Its latest constitution, drafted in 1925, is advanced in every way. It provides for a Chamber of Deputies and a Senate. The former is entirely elected by direct, universal, secret manhood suffrage, for a term of three years; the latter is largely elective. The president of the republic is elected by the Chamber and Senate in joint session; he serves for five years. He has no veto and in general not much more authority than the president of France. Real power resides in the cabinet of ministers, the fourteen members of which are individually and collectively responsible to Parliament. There is much freedom of speech and of the press, and the people are occasionally able to impose their will. Elections are often quite free and governments are now and then turned out by the electorate, although

oftener by revolutionists. Bureaucracy exists in an advanced stage and the state machine works slowly.

The country is divided into administrative districts, controlled by prefects appointed by the central government just as in most European countries. Authority is centralized. Police control is not so rigid as in the rest of the Balkans, but the ignorant village masses are more neglected than in Bulgaria and there is more illiteracy. The chasm between the intellectuals and wealthy on the one hand and the people on the other is deeper. Great political, economic and social chaos prevailed in Greece from the beginning of the World War until Eleutherios Venizelos returned to power in 1928; but since then there has been steady and striking improvement.

Albania, which attained independence in 1912 as a result of the First Balkan War, is about 16,000 square miles in extent and has about 1,100,000 inhabitants. It has been since the World War successively republic, dictatorship and monarchy. All real power rests in the hands of King Zog. The fairly liberal constitution provides for a Parliament of one chamber, elections and a responsible cabinet; these are all managed by the king. There is a judicial department with some independence; there are district governors appointed by the central government, three independent religious communities largely under state control, a national bank, regular and drastic tax collection and a school system of promise. Albania has not been able to satisfy its pressing financial needs from its own resources. It has obtained substantial financial aid on liberal terms from Italy, as a result of which the two countries have concluded pacts of friendship which assure Italy an important influence over Albania's foreign affairs.

TURKEY. The Turkish state at its best period, in the sixteenth century, was a semitheocratic monarchy composed of two nearly separate institutions corresponding generally to the state and the church in western Europe. The sultan was owner, commander and chief executive of the Ruling Institution, which was recruited on a slave basis mainly from the subject Christian nationalities and trained to the work of government and war. The sultan—not yet regularly called caliph (see CALIPHATE)—was also head of

the Moslem Institution, which, recruited from Moslem stock, not only maintained religious worship and charity and provided education based on the Koran but also produced judges and interpreted the theoretically changeless Sacred Law. Subject peoples, notably Greeks and Armenians, were organized in *millet*s paralleling the Moslem Institution. Relations with foreigners were regulated by Capitulations (*q.v.*), unilateral charters granted by the sultan allowing extraterritorial privileges and low fixed tariffs. The Ruling Institution was destroyed by Maḥmūd II in the early nineteenth century as corrupt and useless; over a period of fifty years and against heavy passive resistance it was gradually replaced by a westernized monarchical system whose promised reforms ran far ahead of practice. A group of Young Turks furthered modernization on a benevolently imperialist rather than a nationalist plan.

In an effort to halt the disintegration of the Turkish Empire a new movement of Young Turks, centered in Paris and Salonika, forced 'Abdul-Hamīd II on July 24, 1908, to promulgate afresh the short lived constitution he had granted in 1876; it was amended in certain details in 1909. The sultan's power was greatly restricted; administration was entrusted to a responsible grand vizier and cabinet. The Chamber of Deputies, elected indirectly for four years by wide male suffrage, was checked by an appointed Senate. After 1908 Turkey tried first fraternization and then pressure in an effort to unify all the nationalities and religions within its boundaries; both failed because of the strong nationalism of the non-Turkish groups. Defeat in the World War finally compelled Turkish opinion to visualize clearly a national state composed of Turks alone; the exchange of nationals with Greece in 1922 was in direct line with this new conception.

After the outbreak of the World War and before their own participation the Turks declared the Capitulations abrogated, a change which was not fully accepted by other nations for ten years. War conditions allowed the concentration of authority in the triumvirate, Enver, Talaat and Jemal, who fled after the armistice of Mudros. Weak Mohammed VI and his ministers, dominated by foreign and especially British influences, were led to sign the destructive Treaty of Sèvres in 1920. Mustafa Kemal Pasha, already a leading army officer, thereupon led a nationalist opposition which, stimulated by western aggressive intentions and the Greek invasion,

ultimately defeated all domestic and foreign enemies and obtained a liberal revision of the peace arrangements in the Treaty of Lausanne of 1923. Step by step great constitutional changes were effected: the sultanate was abolished in November, 1922, and the caliphate in March, 1924; the *millet* system was done away with, the more easily because of the extermination and expulsion of the Armenians and Greeks of Anatolia; the Mohammedan church organization was brought low by confiscation of endowments, suppression of orders and exclusion from education; and a radically new constitution was prepared and promulgated in 1924.

By the constitution all power belongs to the people. All males above eighteen (since 1931, above twenty-one), with the usual exceptions, create by indirect election for a term of four years a unicameral Grand National Assembly, which possesses complete legislative power. It elects from its membership a president of the republic to serve during its own term. The president selects the prime minister, or president of the Council of Ministers, who chooses the other ministers; prime minister and cabinet are taken from the Assembly and are collectively and individually responsible to it. A Council of State decides administrative controversies and advises the government on contracts, concessions, legislation and administrative regulations. As head of the state the president presides over the Assembly on ceremonial occasions, but he may not deliberate or vote. He must either promulgate or veto any law within ten days of its enactment; the Assembly can adopt the law over the veto by a simple majority vote. He is responsible to the Assembly only for high treason.

Personal liberty is guaranteed by article 68 of the constitution but may be limited by law in the interest of the rights and liberties of others. In emergencies the cabinet may decree martial law for not more than one month. Since 1928 there has been no state religion; religious freedom is guaranteed by the constitution. Primary education is obligatory and free. Public expenditures for each year are budgeted and subject to review by a special Court of Accounts. Amendments to the constitution may be proposed by at least one third of the total number of deputies and adopted by two thirds; article 1, "The Turkish State is a Republic," cannot be amended. Local government is partly elective, but each of the sixty-three vilayets is supervised by a vali, or governor, appointed by the central government and possessed of extensive powers.

The system embodied in the Turkish constitution is thus simple, democratic, liberal and individualistic. If set up in a new community "of wise, forceful men of invincible good will" it would secure ideal conditions. In Turkey it is being applied to a people who are impoverished and weakened by generations of bad government and years of war, who are strongly conservative, bound by the traditions of Mohammedanism and lacking in political experience, appropriate education and administrative training. The problem of democratic government was made more difficult by adverse economic conditions which were partly an aftermath of the war, partly a result of the death or expulsion of many individuals who before 1914 had been outstanding in various economic activities. It was therefore but natural and in continuity with Turkey's monarchical tradition that a small group consisting of a well known leader and his followers should be relied upon to guide affairs.

Without any change in the constitution the whole control of affairs was gradually transferred to Kemal. The government has become in actuality a live and effective monarchy, a benevolent despotism expressing the will of a capable and experienced man, aided by a group who have learned to work with him by close association through twelve or more years. Ismet Pasha has been prime minister since 1925; the remainder of the cabinet has been somewhat changed. When the time arrived in 1927 for electing the third Assembly, the deputies representing the People's party elected a committee to nominate candidates; this committee transferred all its powers to the president. Thus the Assembly became in reality an appointed body. A similar procedure was followed in 1931, except that thirty places were left open for independents, of whom only twenty were elected. Attempts in 1925 and 1930 to organize opposition parties came to nought. Revolts of the Kurdish minority in the same years were suppressed by military action and deportations. Several plots against the government have been discovered and the leading plotters executed. The press is effectively censored.

The government has exercised almost unparalleled power in remaking the institutions of the country. It removed the seat of government from Istanbul (formerly Constantinople) to Ankara (formerly Angora). It accomplished a complete separation of church and state. Men were ordered to wear clothing after the western fashion. The Latin alphabet was substituted for the

Arabic. In March, 1930, women were made eligible to vote for and sit in municipal councils throughout Turkey. Civil, commercial and criminal law have been greatly changed by the adoption of codes taken from Switzerland, Germany and Italy respectively. The government has built a considerable mileage of railways out of revenue and negotiated a method of payment of the Ottoman pre-war debts. For the year 1931-32 it ordered a reduction of about 20 percent in the budget. Its political and economic measures frequently reveal a jealous nationalism.

ALBERT H. LYBYER

See: CALIPHATE; CAPITULATIONS; NEAR EASTERN PROBLEM; COMITADJI; EMPIRE; PAN-TURANISM; PAN-ISLAMISM.

SPAIN AND PORTUGAL. *Spain*. Since the bloodless revolution of April 13, 1931, which overthrew the Bourbon monarchy, Spain has been ruled by a provisional republican government. The revolution came two days after municipal elections in which the republican candidates secured an overwhelming majority, especially in the larger cities. A revolutionary council consisting of representatives of all the republican parties took over the government; King Alfonso XIII, unable to stem the mounting republican tide, left the country on the advice of the majority of his ministers. He did not formally abdicate but stated that he was allowing his people to decide between republic and monarchy; the elections of June 28 to the Constitutional Convention (Cortes Constituyentes), however, indicated no recession in the strength of republican sentiment.

The explanation of the divorce between the people and the king which culminated in the revolution is to be found primarily in the policy of absolutism pursued by the monarch. According to the last Spanish constitution, that of 1876, Spain was to be a constitutional and parliamentary monarchy. The constitution did not state specifically just where the sovereignty resided, but the nature of its provisions indicated that it was embodied in the king jointly with the Cortes, the Spanish parliament. The power to enact laws resided with the Cortes and the king. The Cortes consisted of two chambers of equal power and competence, the Congress of Deputies elected directly by the people for a five-year term and the Senate made up of three classes of senators: senators in their own right—sons of the king and of the prince of Asturias, members of the nobility who possessed the privilege of being *grandees* of

Spain, the captains general of the army and the admiral of the navy, the patriarch of the Indies and the archbishops, the president of the Council of State, of the Supreme Court of Justice, of the Royal Court of Accounts and of the Supreme Council of War and the Navy; senators appointed for life by the crown; and senators elected by certain state organizations and by the principal taxpayers of each province not directly but through electors (*compromisarios*). All enactments of the king's government had to be signed by one of the ministers, who thereby assumed all responsibility, the person of the king being sacred and inviolate. The king himself named the ministers. Justice was administered in the name of the king by courts composed of trained officials. The king proposed but the Cortes finally determined each year the size of the military forces. The national territory was divided for purposes of administration into broad artificially determined divisions (*provincias*), which were further divided in both rural and urban areas into communes (*municipios*). At the head of each province was a representative of the central government—the civil governor—and a popular assembly (*Diputación provincial*) having a very limited administrative authority. The *diputación* elected a *comisión provincial* to function when the former was not in session. Each *municipio* was headed by a popular assembly (*ayuntamiento*) presided over by a mayor (*alcalde*) elected by the assembly in the small towns and appointed by the central government, generally from the members of the assembly, in all cities with more than a certain population.

This constitutional regime, instituted in 1876 upon the restoration of the Bourbon monarchy, very soon developed into a political fiction. The two large dynastic parties, the Conservative and the Liberal, supported by political power supplanted the national will, which was poorly informed because of the political inexperience of the people, and instituted from the heights of the government downward a vicious *de facto* state, known as *caciquismo*, which gave the keynote to Spanish public life in general, especially in the rural districts. The *cacique*, a rural property owner or the manager of some large estate, coerced the political expression of his settlers or laborers, arbitrarily disposing of their votes and securing in this manner a political power which he placed at the disposal of the candidate for deputy; in return for this the *cacique* obtained from the government certain privileges, such as the appointment of sympathetic local officials

often his own friends, thereby fortifying even more his authority in the locality. He practically dictated the appointment of the local judges. His influence reached into the very highest political spheres, whence he in turn obtained means enabling him further to consolidate and extend his abusive authority. Citizenship became a mere fiction. All the vices of Spanish society were typified in the political circles until there finally came about a radical divorce between the state and the nation. The monarchy instead of correcting these abusive practises promoted them.

In 1898 after the unfortunate war with the United States a vigorous critical reaction was initiated looking toward a national regeneration in spite of the state. During the reign of Alfonso XIII this separation between the people and its governing classes became more emphatic. The king intervened actively and personally in political life, risking the prestige of the crown, already very slight. The coup d'état of September 13, 1923, which foisted upon Spain a dictatorial regime, was the culmination of these conditions, which had inevitably to lead to revolution.

The provisional republican government has radically reformed the military organization, greatly decreasing the excessive number of army officers; it has also authorized the creation of 27,000 new schools as the first step in a program of far reaching educational changes, whose actual realization will necessarily depend upon the available finances. The new constitution as drafted by the Cortes Constituyentes, dominated by the socialists, represents an extremely radical departure from Spanish governmental, religious and social traditions. It declares that "Spain is a republic of the workers of all classes" and sets up property laws which make possible the nationalization of property and of essential industries. It provides for religious liberty and the disestablishment of the Catholic church. The equality of both sexes is recognized; divorce by mutual consent and the equality of legitimate and illegitimate children are provided for. Principal governmental control is entrusted to the unicameral legislature, which is elected by equal suffrage of all men and women over twenty-three; but the president, elected by a combination of the French and American methods, is granted considerable authority. To satisfy the autonomous aspirations of certain regions, especially Catalonia and the Basque provinces, the constitution provides liberal autonomy for such regions as desire it. Considerable interest at-

taches to the constitutional provision prohibiting the declaration of war, even for defense, without previous submission of the dispute to the League of Nations.

Portugal is governed by a political dictatorship maintained by military force. The republican constitution of 1911 has not been repealed, but for all practical purposes it can be considered as abolished. Its application was suspended subsequent to the revolution under Commander Mendes Cabeçadas on May 28, 1926. Since then Portugal has been without a fundamental law defining and regulating the rights of its citizens, pending the promulgation of a new constitution expressing the political philosophy of the present dictatorship or the triumph of the strong revolutionary movement aimed at a restoration of the democratic republic.

The explanation of Portugal's political history since the early nineteenth century can be found only in its peculiar social and economic structure. Brazil's achievement of independence in 1822 left Portugal with the pressing necessity of reorganizing along new lines its own economic system, hitherto based entirely upon the riches arriving from the distant colony and leaving the productive energies of the mother country unused. It thus became necessary to substitute the system of "state communitarism," as the Portuguese historians call it, for the economic liberalism which at that time dominated the entire civilized world. It was necessary to reduce the enormously excessive bureaucracy which weighed down the national economy, forcing it to sustain a socially unproductive class which had become accustomed to live from the favor of the state. Agriculture needed encouragement through reduction of the heavy taxes. An industrialization of the country had to be attempted. Portugal never succeeded in completing these far reaching reforms, proclaimed by some of its most prominent statesmen. It continued to live on an artificial economy which neglected truly productive national activities, surmounting difficulties which presented themselves at every step, having recourse to foreign loans that made the nation economically a tributary to the capitalism of other European countries, especially England.

The failure of all the attempts at reform, due primarily to the resistance of the old traditional interests enjoying the protection of the monarchy, accentuated the national misery and created a powerful republican current. Exasperated by the dictatorial rule of João Franco, im-

posed by King Carlos I in 1907, the republican element effected a change of government after the assassination of Carlos in 1908 and the brief reign of his son Manoel. A republic was created in 1910. The constitution of 1911 provided that it was to be headed by a president elected for four years by a bicameral Cortes, the lower house of which was to be elected by direct vote of the people, the upper house by the local popular assemblies.

But the republic did not succeed in solving the old problems, which became increasingly pressing, and the democratic aspirations of the country were smothered by a military dictatorship. Congress was dissolved on July 9, 1926, and has not been reelected. A decree of February 25, 1928, declared that the president of the republic would henceforth be elected not by congress, but directly by citizens above the age of forty-five. Since 1928 the government of the dictatorship has constantly reiterated its intention of promulgating a national statute to replace the constitution of 1911, but as yet this has not materialized.

In 1930 a political party, the *Unión nacional*, was organized under the auspices of the government. According to the statements made by the president of the Council of State it was formed to "cooperate in the work of the dictatorship and to prepare the way for the future constitutional regime," which is to be inspired by a "rational historic nationalism of a reforming and progressive type, which theoretically and in practice is different from systematic socialism and liberalism." According to the minister of finance, Oliveira Salazar, the real task is to combat individualism, socialism and parliamentarism and to assure material and moral order. The executive power would be strengthened and exercised by the chief of state and by the ministers appointed by him, who would be in no way dependent on parliament. The nation would be organized on the basis of moral and economic corporations which would replace the old political parties. The state would be social and corporative, no longer concerned with that abstract type of citizen—"a creation of the liberalism of the nineteenth century"—divorced from his family, his profession and his intellectual and economic atmosphere; rather, it was to be guided by the principle that "the people needs less to be sovereign than to be governed." The possible realization of this political program depends on the outcome of new revolutionary attempts which are being fomented by democratic republicans

now living in foreign countries, and which find support in the national discontent.

LATIN AMERICA includes twenty countries: Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Ecuador, Guatemala, Haiti, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador, Uruguay and Venezuela. The total area of these countries is about 8,000,000 square miles, their total population something more than 100,000,000.

The use of the generic term for the entire group of countries rests upon important similarities and common characteristics. Except for Brazil, which was originally colonized by Portugal, all of the countries were originally Spanish colonies. In all of them a Latin tongue is the official language—Spanish in all except Brazil and Haiti, which employ Portuguese and French respectively. In all the Roman Catholic religion is the historic and dominant faith and the cultural background is rooted in southern Europe. Except for Cuba, Haiti, the Dominican Republic and Panama they all secured their independence through a series of related revolutions in the first quarter of the nineteenth century. All are republics with constitutions setting forth the principles of individual liberty and of democratic representative government. In this respect, as in many others political and economic, they have all been considerably affected by the United States of America, although to varying degrees.

Yet the points of difference between them are so fundamental and so numerous that there is great difficulty if not danger in considering them in common terms. There are striking geographic and ethnic differences. In area they vary from Salvador with 13,000 square miles, about the size of Maryland, to Brazil with about 3,300,000 square miles, roughly equal to the whole of continental United States with Texas doubled. In population they range from about half a million in Costa Rica and Panama to some forty millions in Brazil, which with 40 percent of the total area and population of Latin America and with its Portuguese background is clearly distinguishable from the so-called Spanish American republics. Even among the latter there are enormous and

fundamental variations. Uruguay is a purely agricultural country lying wholly in the temperate zone at sea level and with a population which is almost completely white. Bolivia is an enormous inland country lying wholly in the tropics, but with a vast plateau at an average elevation of more than 12,000 feet; it is principally a mining region and has a population made up in large part of pure Indian blood, most of the remainder being of mixed Indian and Spanish descent. The Dominican Republic is located on a tropical island and contains a population with a considerable admixture of Negro blood, while its neighbor on the island is French speaking Haiti with an almost pure black population.

There are also important variations in tradition and history, particularly as regards external political relations. Cuba remained a Spanish colony until 1898, when it became a ward of the United States. The history of Mexico and Central America could not be written without including important sections of the history of the United States, and the history of Panama during the last three decades is practically a phase of that of the United States. Chile, on the other hand, most remote of Latin American countries until the Panama Canal was opened, has experienced but little direct influence from the North American colossus; but its own influence has been potently felt by Peru and Bolivia. Argentina also has largely worked out its own salvation, although at times it has been threatened by or has threatened Chile, Paraguay, Brazil or Uruguay. The situation of Paraguay can be understood only in relation to the suicidal war waged by its insane Francisco Lopez from 1865 to 1870 against the combined forces of Brazil, Argentina and Uruguay.

From such far reaching variations have inevitably flowed important differences in education, social and economic conditions and government. Even grouping of Latin American governments for analysis is therefore quite difficult. In important respects Costa Rica resembles distant Uruguay more closely than Nicaragua, its neighbor. Chile is more like Mexico than like Paraguay. Structurally Argentina, Brazil, Mexico and Venezuela are all classified as federal states, yet their constitutional arrangements show astonishing divergencies. Chile and Colombia are both unitary governments, but the federal tradition in the latter country is even now very strong. Cuba with its Platt Amendment, Haiti and the Dominican Republic with their financial and customs disabilities, Nicaragua with its

United States marines and Panama with the limitations imposed by the Panama Canal situation are not completely sovereign states at all, while Uruguay is as completely independent as any European country.

The most important single factor lending common characteristics to contemporary Latin American governments is the common background of three centuries of unfortunate experience as remote, exploited but otherwise undeveloped colonies. The natives were killed off in warfare or by slavery or disease, as on the east coast, where African slaves supplanted them in the tropical regions; or forced into peonage, as in the mine regions of the west coast; or at best left in a state of savagery. The heroic efforts of the Jesuits and other orders to alleviate the condition of the natives bore some fruit, but on the whole the Indians constituted human machines to be exploited. The same treatment was accorded the large mestizo population which soon constituted an important element in many regions. Education, economic opportunity and political power were the right only of the favored Peninsulars. Even the pure blooded Spaniards and Portuguese born in the Americas, the so-called Creoles, were excluded from positions of importance in the government and the church, which assumed in the colonies a position relatively as important as in the mother countries.

The common attitude of the colonial governors was that the colonies were theirs for exploitation and for personal gain. In many cases the royal grants were distinctly on those terms: the crown wanted its share, but apart from this the grantees were in complete control. To despoil the natives and the colonists for personal gain was quite orthodox; to rob the crown of some of its percentage was regarded as dangerous perhaps but not reprehensible. The concept of a government post as an opportunity for personal gain rather than as an obligation of public service inevitably became accepted by the elements that formed the governing class in the days of independence. The widespread existence of political corruption in Latin America, which is very generally admitted and regretted by Latin American writers, is in large part a heritage of this colonial administration. But in its maintenance the agents of foreign banks, of foreign public utilities and other concession seeking corporations have played a very important part. The very life of existing governments has in some cases been made dependent upon subservience to foreign exploiting interests.

The movement for independence was largely influenced by the successful North American revolution against Great Britain and by the stirring events of the French Revolution. Nevertheless, of considerable importance in connection with it were the large body of antimonarchical egalitarian Spanish writings and the liberal movement in Spain which resulted in the adoption of the advanced Spanish constitution of 1812. Indeed the movement which culminated in independence was a protest at first largely against the Bonapartist usurpation of the Spanish throne in 1808 rather than against the already serious abuses of the Spanish rule itself. Not until the restored Ferdinand had shown his absolute devotion to reactionism did complete independence become the rallying cry throughout the movement, although it had already taken on a separatist character in certain regions. The long struggle for independence lasting from 1810 to 1824 was carried on under much more difficult conditions than in the North American revolution, and its successful termination left the liberated regions in a much more critical situation. The enormous distances, the sparseness of the population, the impenetrable forests, the impassable mountains, the character of the population, the bitterness of the contestants, all imparted a character of fierceness, cruelty and vindictiveness. It was a war of extermination marked by wholesale executions, confiscations, reprisals, betrayals, burnings and sackings by both sides. Organized action, deliberation and cooperation, even as feeble as the measures of the North American Continental Congress and the Congress of the Confederation, were impossible. Ruthless unrestricted military leaders and their lieutenants alone could have accomplished what was accomplished in the Spanish colonies. With each man a law unto himself jealousies, internal struggles and internecine wars permitted only the most ruthless and daring to survive. Only in Brazil, where the presence of the prince regent of Portugal facilitated the establishment of an independent empire, was bitter civil war avoided.

The regions set up as independent states after the revolutions corresponded roughly to the Spanish colonial divisions—viceroyalties, presidencies, captaincies general and provinces—but undetermined boundaries in some cases caused difficulties which have only recently been settled or in a few cases still remain unsettled. The countries received constitutions modeled on that of the United States of America. As an ex-

pression of faith in the principles of popular government, as an expression of an ultimate ideal, this action was significant. As an actual achievement of democracy it was of course wholly illusory.

Within the new countries conditions were in many respects not far from barbarism. There was practically no economic life, no money, little agriculture, less industry. Vast landholdings were in the hands of a few families and the church; the great mass of the population was illiterate, penniless and little better than serfs. The only hope for progress lay along the same path that had achieved independence: the domination of all powerful individuals or groups. When these individuals were self-seeking and unscrupulous, the countries went from bad to worse until the rulers were overthrown. When they were patriotic and able, the countries prospered, although the control was no less absolute.

In the seventy-five years of the nineteenth century after independence was achieved progress was phenomenal. It varied enormously in the different states according to economic, social and international conditions; but some progress occurred everywhere. Economic and social progress was more rapid than political progress, but the latter was also apparent. Gradually power gravitated from military to civil leaders, although these latter were inevitably of the great landholding classes. The greatest material as well as social advances were made under the most complete dictators of the more enlightened stamp. Noticeable advances in political democracy were frequently made at the expense of material progress, and the reaction sometimes appeared to swallow up all the previous gains.

Gradually there arose in most of the countries, which heretofore had contained but two economic classes—on the one hand the great landholders, including the church, and on the other the peons and laborers—a middle class of mechanics, shopkeepers, clerks and small landholders, who acquired along with the rudiments of education a consciousness of political power. The oscillations of political power between liberals and conservatives, which for many years had represented merely alternations between hostile groups of the landed classes, began to have more real significance. The mass of the population, still largely poor and illiterate, might yet be either indifferent to changes in power or fiercely loyal to a popular hero, but the growing middle class could no longer be ignored. Immigration while adding to the economic

growth of the countries also introduced elements less docile and more ready for united action.

The year 1929 witnessed a widespread recrudescence of revolution and violence. These revolutions were apparently a reversion to the long period of government by revolutionary dictators which in most of Latin America appeared to have definitely passed. But these upheavals must be interpreted in the light of the world wide disturbed and unsettled conditions of the period, which forced so many of the countries of the Old World to resort to government by dictatorship. Some of these disturbances furthermore have been the result not of a turning back from the road of democracy but of a further step forward. The increasing strength of the middle class and its more effective insistence upon enlarged democracy have been important factors. The inevitable resentment against those in power when depression came (and in Latin America, at least, some of the most serious aspects of the present critical situation can with justice be attributed to those in power) has been aided by a strong feeling that the mass of the people must have more voice in governmental affairs.

From the very first, while the constitutional forms were modeled after those of the United States, the actual administration was molded along continental, particularly French, lines. The civil law, partly the inheritance of the Spanish royal ordinances, partly revamped along the lines of the *Code Napoléon*, has determined the legal system. The continental scheme of public administration, particularly the predominance of the executive officers under the Spanish colonial system and under the Bourbon and Napoleonic regimes of France, has from the first stamped the relations of the government to the individual. But in many respects even this situation is gradually changing. The supremacy of the judiciary, for instance, a characteristic North American constitutional innovation quite foreign to the concept of public law in France, has actually become operative in several Latin American states, especially the federal states. The organization of public education, which so long followed the European example, is moving distinctly toward an approximation of the North American system.

The influence of the United States has naturally been very potent. The open sympathy for the aspirations for independence of the Latin American colonies, dramatically evidenced in the famous message of President Monroe to

Congress in 1823, aroused a corresponding enthusiasm among the leaders of those countries. Gradually that enthusiasm and appreciation gave place to fear and suspicion in many quarters, stimulated at first by relations between the United States and Mexico, fanned into greater intensity by the developments in Central America and the Caribbean following the Spanish American War and the acquisition of the Panama Canal Zone and by no means diminished by the occurrences during the administration of President Wilson. While many factors have been working in the other direction, notably the inter-American conferences of various kinds, better communications and trade relations and increasing interchange of individuals and ideas, the Latin American countries have among themselves been approaching a better understanding and a greater community of feeling. Means of communication have improved enormously and the potent factors of a community of racial background, language and religion have led to some tangible evidence of the ability to act jointly, as in the case of the so-called A.B.C. combination. Thus far, however, attempts to reestablish the former Central American Union (see CENTRAL AMERICAN FEDERATION) have proved abortive.

Among the outstanding features of governmental organization in Latin America are the universality of presidential as contrasted with parliamentary government and the adoption of the federal system by the three principal countries, Argentina, Brazil and Mexico, as well as by others. By the first quarter of the nineteenth century parliamentary government had developed only in Great Britain, where it was coupled with the hereditary monarchy; its actual workings were but little understood elsewhere. The presidential form as exemplified in the United States was not only best suited to actual conditions in Latin America but was really the only model available. Where the parliamentary form was tried in one or two instances, notably in Chile, it proved unworkable. It is true that Balmaceda was overthrown in 1891 partly because he challenged the supremacy of the Chilean Congress; but the events of subsequent years proved the unsuitability of this system to conditions in Chile, and in the constitution of 1925 it was expressly abandoned in theory as it had already been in practice.

The application of the federal principle in Latin American governments is of interest not merely because in this respect the example of the United States has been very powerful but also

because many of the most serious disturbances have centered about this question. Upon the overthrow of the empire in 1889 Brazil without much discussion adopted the federal form, closely modeled on that of the United States. But in Argentina the question of federalism caused bitter struggles for many years and in Mexico it was an ever active source of disagreement. In Venezuela there were several oscillations between the unitary and the federal form before the latter finally triumphed. In Colombia the struggle was even more bitter and prolonged before the unitary form ultimately triumphed. In Argentina, Brazil and Mexico the problem of the position and rights of the states is a source of considerable conflict. In these controversies the theory and practise of the federal scheme of the United States of America have played a dominant role, and as a consequence some of the ablest scholars in American constitutional law have been found among Latin American statesmen. In general it may be said that the tendency of the states to desire federal aid without federal interference and the tendency of the federal government to extend its sphere of action have both been more pronounced in Latin American federations than in the United States.

Argentina with an area 1,153,000 square miles and a population of 11,000,000 is a federal republic composed of fourteen provinces, or states, one federal district and ten territories. In general the form of the federal constitution follows very closely that of the United States of America, although there are important variations. But Argentine constitutional history has been colored first by the struggle between the unitary and the federal principle, finally settled in the constitution of 1853; then by the controversy as to the position of the capital city in the structure of government, fixed in the revision of 1860; and since then by the problem of the actual relations between the federal government and the provinces. The president, who must be a Roman Catholic, is elected for six years by an electoral college and is not eligible for reelection until after an intervening term. The legislature comprises a Senate of thirty members (two from each province and two from the federal district) chosen by the legislatures for a term of nine years, one third being elected every three years, and a Chamber of Deputies of 158 members chosen by adult manhood suffrage for a term of four years, one half being renewed every two years. The system of federal courts is structurally very similar to that in the United States.

The provinces have executives, legislatures and courts determined by their own constitutions, subject to the requirement that they guarantee a republican form of government. The president in theory and even more in practise exercises a power appreciably greater than that of the president of the United States, a fact which colors the whole operation of the government. Equally significant is the fact that although the distribution of powers between the federal government and the provinces as set forth in the constitution gives the national government only slightly more jurisdiction than in the United States of America, in actual practise the power of federal intervention has made the provincial governments the creatures of the national administration. Articles 5 and 6 of the Argentine constitution, although not strikingly different in wording from article v, section 4 of the Constitution of the United States, have in practise virtually destroyed the essence of federalism in Argentina.

Brazil with an area of 3,276,000 square miles and a population of about 40,000,000 is a federal republic governed by the constitution adopted in 1891 modified in 1926 and 1931. Brazil was in many respects more fortunate than the other Latin American countries. The achievement of independence in 1822 had been accomplished without violence, and for sixty-seven years under the empire a considerable element in the population had acquired experience in government under a constitutional monarchy. Various difficulties, including the enormous size of the country, the lack of communications, the large Negro population and the impossibility of widespread education, militated against the rapid achievement of economic, social and political democracy. But the abolition of slavery in 1888 and the overthrow of the empire in 1889 with the adoption of the federal republican form of government found Brazil in every way in a much more favorable position for the development of democracy than most of the other Latin American countries at that time.

Resentment against complete centralization under the empire and subordination of the provinces was one of the grievances against the monarchical regime and led naturally to the adoption of the federal form in close conformity to that existing in the United States of America and in Argentina. The struggle between federal and unitary ideas was not so prolonged, uncertain and bitter as in Argentina; but as might be expected from the vast and heterogeneous character of the country and its inhabitants separa-

tism assumed a more important role, and there has been real and continuing danger of secession both in the extreme south and in the extreme north.

The president is elected by direct popular vote for four years and is ineligible for immediate reelection. His power while theoretically not markedly greater than that of the president of the United States is in actual practise considerably greater although perhaps not so much so as in Argentina. The National Congress comprises a Senate and a Chamber of Deputies. The Senate is made up of sixty-three members, three from each of the states and three from the federal district, chosen by direct popular vote for nine years, one third being renewed every three years. The Chamber of Deputies comprises 212 members chosen by direct suffrage for three years. The federal franchise in all cases is based on a literacy requirement. The system of federal courts is filled by presidential appointment.

The twenty states enjoy theoretically the same powers of local self-government as do those of the United States. Actually, through the power of federal intervention and the dominance of the executive, they have been greatly subordinated in importance although much less so than in Argentina. Political power in the national government has been divided up by a working arrangement between the dominant forces in the two major states, São Paulo and Minas Geraes, the presidents having been alternately chosen from the political leaders in those two powerful states. This has caused resentment in the other states, particularly in Rio Grande do Sul and in the other states of the extreme south and extreme north, and has led to revolutionary outbreaks. As long as the two major states, comprising much of the wealth and two fifths of the total population, worked hand in hand the other regions were powerless. The disruption of this working arrangement in 1930 was one of the major factors in the success of the revolutionary movement of that year headed by the chiefs of the state of Rio Grande do Sul.

Mexico with an area of 767,000 square miles and a population of about 16,000,000 is by the provisions of the constitution of 1917 a federal republic whose constitutional organization is modeled largely on that of the United States with some theoretical and many actual divergencies.

The constitutional history of Mexico since the first abortive movement toward independence of 1810 has been marked by almost continual dis-

turbances. Conflict between the advocates of unitary as against federal organization; conflict with the church; conflict over financial and land policies; conflict over foreign concessions; war with the United States; uprisings against the empire of Maximilian, imposed by France; and similar events have made normal governmental and institutional development almost impossible. It is significant that the period of greatest material development occurred during the thirty-five years of the Díaz regime, which was an absolute dictatorship without regard to constitutional forms and left a serious heritage of bitterness and lawlessness when his strong rule was finally overthrown.

While the principle of federalism finally triumphed in the constitution of 1857, not until the constitution of 1917 was promulgated and gradually put into actual operation in the years following the inauguration of Obregón in 1920 was there some approximation in actual government to the constitutional principles laid down. The disturbed condition of the country, due perhaps chiefly to the controversy with the church, makes extraordinary measures still the rule rather than the exception.

The constitution of 1917 provides (article 27) among other things for the breaking up of the large landed estates, the national ownership of natural resources and the disestablishment of the Roman Catholic church together with the nationalization of its property. The application of the clause regarding natural resources led to a lengthy controversy with the United States of America. Article 123 of the constitution contains detailed provisions for the protection of labor, including the eight-hour day, the minimum wage, workmen's compensation, freedom of association and the prohibition of fees for securing employment.

As amended in 1928 the constitution provides for the election of the president for a six-year term by direct popular vote. The federal Congress consists of a Chamber of Senators and a Chamber of Deputies. The senate consists of fifty-eight members, two from each of the twenty-eight states and two from the federal district, elected by direct popular vote for four years; the 150 deputies are elected for two years, the two federal territories being entitled to at least one deputy each. The federal judges are appointed by the president, although the Supreme Court judges were formerly chosen by the Congress.

The individual states have the right to adopt

their own constitutions; but the federal constitution prescribes in considerable detail the forms to be adopted, and the power of federal intervention gives the national government an actual control over the states not very different from that experienced in Argentina and Brazil under similar provisions.

Uruguay with an area of 72,000 square miles and a population of about 2,000,000 is the smallest in area of the South American republics. Erected as a buffer state in 1828 through the influence of Great Britain after Argentina and Brazil had been at war over the region, Uruguay possessed advantages of location, fertility, compactness and relative homogeneity of population, which, however, did not prevent its being in almost continual political turmoil for half a century following its establishment as an independent state.

The government is a unitary one with a president elected by direct vote for four years and a Congress of two chambers, the National Chamber of Representatives and the Senate. The representatives, 124 in number, are elected for three years by direct vote on the basis of proportional representation. The nineteen senators are chosen by electoral colleges in the departments for a term of six years; one third of the Senate retires every two years. The legislative branch has more theoretical and actual power than that of any other Latin American country, thus reducing the customary dominant role of the executive. Even more novel and effective in Latin America is the role of the National Council of Administration, which shares the executive power with the president. This council consists of nine members elected by direct popular vote for six years with overlapping terms. The minority party is assured three members of the council. The jurisdiction of the council extends to matters of administration not expressly reserved to the president: budget and finances, elections, public instruction, public works, labor, industries, agriculture, charities and sanitation. Conflicts of jurisdiction between the president and the council are settled by the Congress.

The constitution of 1919 accorded a considerable degree of self-government to the departments, including a representative assembly and an administrative board, both elected by the people. The chiefs of police, however, are still centrally appointed and controlled.

Since 1919 the political and material progress of the country has been marked. Advanced social

legislation has been passed including the eight-hour day, old age pensions and workmen's compensation.

Chile, with an area of 290,000 square miles and a population of about 4,000,000, after the achievement of independence in 1818 and a subsequent fifteen-year period of violent disorders enjoyed a relative freedom from serious disturbances following the promulgation of the constitution of 1833. This constitution contrasted quite favorably with those of most of the other Latin American republics; it remained in force, at least nominally, until 1925. The reason for this relative stability lay partly in its geographic isolation from disturbing conditions in neighboring countries, partly in the compactness of population in the long narrow fertile Vale of Chile and partly in the closed aristocracy of birth and wealth which made it for generations one of the most conservative of Latin American states.

Until the most recent period the most serious political upheaval was the overthrow of Balmaceda in 1891. But during the century since 1833 liberal ideas had been gradually gaining strength and had even been championed from time to time by successful candidates for Congress. This liberalizing movement achieved at least an outward triumph in 1920 in the election of Arturo Alessandri, Chile's first middle class president.

A new constitution was adopted in 1925 which enunciated many liberal principles, definitely superseded the parliament by the presidential system, disestablished the Roman Catholic church and seemed to end the long control by the ultraconservative and ultramontane forces. While the almost continuous political upheavals since Alessandri's presidency have prevented any extensive realization of the benefits of this new political orientation, it is not likely that the new liberal ideas will be permanently surrendered.

The president is elected for six years by popular vote. The Chamber of Senators with forty-five members and the Chamber of Deputies of 132 members are elected by direct popular vote from the departments and provinces into which Chile is divided. Although the unitary form of government still prevails, the latest constitution represents a step toward political decentralization. The provinces are accorded popularly elected assemblies presided over by the centrally appointed intendant, who possesses the veto power but who cannot veto measures which

have been passed by a two-thirds vote of the provincial assembly.

JAPAN. The present Japanese government dates from the restoration of 1867. The new regime in its inception was the ancient brought back to life in new garb. Japan in antiquity was a patriarchal nation, whose ruler was in direct touch with his subjects. As time passed this simple form of government became impracticable and in the middle of the seventh century the emperor inaugurated the Council of State (*Daijo-Kwan*), presided over by the chancellor (*daijo-daijin*) assisted by the minister of the right (*u-daijin*) and the minister of the left (*sa-daijin*). There were also organized eight administrative departments, each under a minister who participated in the deliberations of the council. At the same time a division was made between civil and military officials: the former lived an effeminate life of refinement and luxury at what is now Kyoto, at that time the seat of the imperial court; the latter, who were sent to remote provinces to preserve peace, waxed powerful beyond the control of the central government. By the end of the twelfth century Minamoto-Yoritomo, the greatest of these military chieftains, had established at Kamakura far removed from Kyoto a government of his own called *Bakufu*, known to the west as the shogunate from the official title, *shēi-tai-shōgun* (barbarian-subjugating generalissimo), conferred upon him by the emperor. The shogunate in order to perpetuate its power appointed from among its own loyal soldiers a hierarchy of military officials, who actually although not formally superseded the civil functionaries appointed by the Imperial Court. For years the shogunate exercised the powers thus usurped from the Imperial Court.

The restoration meant not only the return of the shogun's powers to the emperor but also the reappearance of the governmental form instituted in the seventh century. The Council of State was restored in 1867 and the eight governmental departments in 1871. In 1868 the emperor, then only fourteen years of age, proclaimed the Oath of Five Articles, the first of which declared that "public councils shall be organized and all governmental affairs decided

in accordance with public opinion." The same year the capital was moved from Kyoto to Tokyo (then Yedo), for three hundred years the seat of the shogunate government. The following year all the feudal lords, three hundred in number, voluntarily relinquished their fiefs in return for bonds issued by the government. In 1871 the entire country was divided into prefectures, each with a governor appointed by the central government, thus inaugurating a highly centralized government in place of the highly decentralized feudal system. Simultaneously the samurai, the soldier retainers of the former feudal lords, also gave up their hereditary pensions in exchange for government bonds. The leaders in politics and officialdom under the new regime have largely come from this class with its long tradition of chivalry and culture.

The first memorial for the inauguration of popular assemblies was presented to the throne in 1874. In the same year *Aikoku-Koto* (Patriotic party), the prototype of the present *Seiyukai* party, was launched by Taisuke Itagaki, often called the father of liberty. In 1875 the government instituted the *Genro-In* (Council of Elders) and the *Chihokwan Kwaigi* (Local Governors' Conference). The first consisted mostly of former feudal barons, the second of prefectural governors. Neither had any popular element. In 1879 prefectural assemblies elected by qualified voters were inaugurated.

Meanwhile the constitutional movement gathered momentum. The agitation, often accompanied by bloodshed, had become so ominous that in 1881 the government was obliged to issue an imperial rescript promising to convoke a parliament in ten years. In 1882 Hirobumi Ito, destined to become one of Japan's foremost statesmen, was sent abroad to study European constitutions. Upon his return Ito set about fitting the government to his constitutional scheme based on the German model. First, he created in 1884 a new nobility of five orders (prince, marquis, count, viscount and baron) whose members were to constitute a majority in the upper House. Next, the Council of State was abolished in 1885 and replaced by the cabinet, presided over by the prime minister and composed of the ministers of state. The *Genro-In* was also abolished. The Privy Council, evidently conceived as another check on the lower House, was organized in 1888. In addition a bureaucracy, trained to carry on the government's policies quite independently of the vicissitudes of politics, was established.

With the stage thus set the constitution, together with the Imperial House Law, the Imperial Ordinance concerning the House of Peers, the Law of the Diet and the Election Law for the House of Representatives, was promulgated in 1889 as a gift of the emperor. The liberals saw in the constitution a design to perpetuate the power monopolized since 1867 by Satcho men, the politicians of the former feudal provinces of Satsuma and Choshu, which had worked together for the abolition of the shogunate. The liberals, who came from the provinces which had not been influential in the restoration movement and which were neglected in the distribution of offices under the new government, said that the restoration had simply meant the substitution of Satcho for the shogunate and demanded real parliamentary government.

With the convocation of the Diet in 1890 this old animosity manifested itself, often in violent form. The cabinet to put through its bills resorted to bribery, intimidation and dissolution of the lower House. For almost fifteen years Japan's constitutional history was largely a record of this struggle. In that period the successive cabinets with few exceptions were solidly Satcho, professing to transcend the political parties and refusing to recognize cabinet responsibility to the House of Representatives. The opposition factions, in their struggle to break up the Satcho monopoly, insisted that the cabinet be founded upon party principles and be responsible to the House of Representatives.

The Satcho position was not easy to maintain. Its supporters in the lower House were usually in the minority, and in 1898 Itagaki's *Jiyuto* (Liberals) and Okuma's *Shimpoto* (Progressives) combined under the new name of *Kenseito* (Constitutional party) to force the resignation of a Satcho cabinet under Ito's premiership. The Okuma-Itagaki coalition cabinet which followed was Japan's first party cabinet. But the coalition soon collapsed, and the Satcho clique returned to power. Nevertheless, from about 1906 the Satcho domination gradually weakened and practically ended when Kei Hara with no Satcho affiliations organized a cabinet of the *Seiyukai* (formerly *Jiyuto*) party in 1918. The decline of the Satcho clique and the increasing dependence of the cabinet upon the political parties have in effect established the fact that whatever the letter of the constitution, in practise the cabinet is responsible to the House of Representatives.

The Japanese constitution is an attempt to harmonize the ancient native conception of the

sovereign with the new occidental idea of parliamentary government. Naturally, the emperor is made to appear supreme; in practise, however, he is more like the king of England than like the former German emperor. He has never vetoed a bill passed by the Diet. He has seldom if ever openly interfered with the acts of the cabinet but has always acted upon the advice of his ministers. There is danger, however, in the possibility of abuse of the emperor's prerogatives by irresponsible cabinets; in the early days this practise was sometimes resorted to as a last means of breaking the deadlock created by the opposition of the lower House. In such cases the House's retort was a memorial to the emperor impeaching the cabinet for "hiding behind the throne." Fortunately, the cabinet has long since ceased to invoke the emperor's name to bring the House to its knees.

A peculiar feature of the cabinet is that the minister of the army must be a general or lieutenant general and the minister of the navy an admiral or vice admiral and that they may submit their views to the throne directly and not through the prime minister. This is a legacy from the period when Japan's foremost concern was the maintenance of her position among the powers, some of which were obviously hostile. In the early days the two ministers often remained in office even in a cabinet crisis, but this practise gradually changed. More recently, especially since the World War, the army and the navy ministers in deference to public sentiment have increasingly been inclined to forego their privilege of direct approach to the throne. Sentiment in favor of the appointment of civilians to the two posts has often been voiced by the press. This tendency met with a setback in the Sino-Japanese clash in Manchuria in 1931 when the press and public almost unanimously supported the military measures taken by the army.

The emperor's supreme adviser is the Privy Council, composed of twenty-six councilors, appointed by the throne with the advice of the prime minister. Cabinet ministers, thirteen at present, are also ex officio members of the council. Constitutionally the council's decision has no binding force upon the cabinet; that is, the emperor cannot and does not force upon the cabinet any recommendation of the council which is unacceptable to it, because the cabinet is in fact if not in theory responsible to the House of Representatives and so cannot afford to accept any recommendation likely to arouse popular opposition. The Privy Council itself has

of late become more sensitive to public opinion, as was seen in its deliberations on the Paris Peace Pact and the London Naval Treaty.

The *Genro* (elder statesmen), not to be confused with the *Genro-In*, form another advisory body to the emperor. Although not provided for by the constitution or by any law, the institution developed out of the custom of the emperor, well established some thirty years ago, of calling men like Ito, Yamagata, Matsukata and Inouye, who had long enjoyed his confidence, into private consultation on matters of extraordinary importance. Formerly the *Genro* seem to have been consulted on many matters, but of late their advice has seldom been sought except in a cabinet crisis requiring selection of a new premier. Their number too has gradually dwindled until there is today only one *Genro*, Prince Saionji. Whether the institution will disappear with Saionji's death is a matter for conjecture. Should it disappear, the emperor may turn to the lord privy seal (*nai-dai-jin*) for advice. It is now, however, a practically established custom to appoint to the premiership the leader of the party which controls the majority in the House of Representatives.

The Diet consists of the House of Peers and the House of Representatives. The House of Representatives is the more important because of its control over the cabinet. It consists of 466 members, returned by 122 electoral districts at a ratio of one representative to every 120,000 of the population within each district. The ballot is secret. Under the original election law of 1890 property qualifications limited the number of electors to some 500,000. In 1900 and 1920 it was increased to 1,500,000 and 2,860,000 respectively by lowering tax qualifications. In 1925 all property qualifications were abolished and manhood suffrage was adopted, increasing the number of voters to 13,000,000. As a result in 1928 eight proletarian members were elected to the House of Representatives. In 1931 a bill to enfranchise women in local elections passed the House of Representatives but was defeated in the House of Peers.

The House of Peers at present consists of 411 members distributed as follows: the 20 members of the imperial family who have reached majority; the 46 princes and marquises over thirty years of age; 150 counts, viscounts and barons elected by their respective orders for a seven-year term; 125 members appointed by the emperor for life in recognition of meritorious service or erudition; 4 members of the Imperial

Academy elected by that body for a seven-year term; and 66 high taxpayers elected by similar taxpayers.

The two houses are coordinate except that the budget must first be submitted to the House of Representatives. The House of Peers, however, may reduce or reject the budget on the same footing as the lower House. The Diet has no power to initiate the budget or to increase the one submitted to it by the cabinet. In the event of the Diet's rejection of the budget that of the preceding year remains in force. Furthermore, the Diet's power to reduce or to reject the budget does not extend to the "civil list," to expenditures based upon the emperor's constitutional powers and already fixed at the previous session of the Diet, such as salaries and pensions of officials, army and navy expenditures and the like, to expenditures caused by the effect of laws passed by the Diet or to expenditures caused by the legal obligations of the government. The only way to reduce such expenditures is for the Diet and public opinion to bring pressure to bear upon the cabinet. Debate on the budget affords the Diet an opportunity to scrutinize all phases of the government's policy. As to general legislation other than the budget, both the government and the Diet may initiate bills, but government bills have precedence in the deliberations of either House. This means practically that few bills originating in the Diet are passed.

Reports of corruption in Japanese politics are frequent, although the cabinet has long since abandoned the corrupt practises of early constitutional days. Members of the Diet receive only 3000 yen (formerly 2000 yen) a year, and as many of them have no other source of income the temptation for corruption is always present. Funds obtained through corruption sometimes find their way into the ever needy party coffers, although such transfers have seldom been proved.

The judiciary consists of a Supreme Court, seven courts of appeal, fifteen district courts and 281 local courts in addition to a Court of Administrative Litigation to handle cases relating to "rights alleged to have been infringed by the illegal measures of the administrative authorities" and military courts, composed of civilian judges and military officers, which have jurisdiction over criminal cases against persons in military service. Judges are appointed for life and cannot be removed "unless by way of criminal sentence or disciplinary punishment." Trials are public, except where publicity is felt to be "prejudicial to peace and order, or to the main-

tenance of public morality." Pursuant to a law of 1923 the jury system was instituted in 1929 in criminal cases in the district courts. The opinion is growing among jurists that the experiment has been a failure and that the jury system does not harmonize with Japanese traditions.

For the purpose of local administration, Japan (exclusive of Formosa, Korea and Sakhalin) is divided into forty-six prefectures. Within the prefectures are 101 cities, 1,485 towns, 10,494 villages. In addition there is the territory of Hokkaido, which administratively is not very different from a prefecture. The whole system is characterized by strong centralization. Each prefecture has a governor, who is appointed and controlled by the central government and who often resigns with the cabinet. Its legislature consists of an assembly and a council. The former consists of at least thirty members elected by male citizens over twenty-five years of age. It has no initiative but deliberates upon the budget and other matters submitted to it by the governor. The council consists of the governor, two high officials of the prefecture and seven to ten members elected by and from the members of the assembly. The council deliberates upon matters delegated from the assembly and advises the governor on various other matters.

The chief executive or mayor of each city is appointed by the central government from among three candidates nominated by the city assembly. His administration is subject to the supervision of the prefectural governor and indirectly to that of the minister of home affairs. The city legislature consists of an assembly elected by male citizens over twenty-five years of age and a council composed of the mayor, high officials of the city and from six to twelve councilors elected by and from the members of the city assembly. Town and village governments are organized in almost the same way as city governments.

CHINA. The government of the Chinese Republic is a dictatorship compounded of elements which have survived from the ancient empire and others borrowed from the democratic republics of the West and the Soviet system of Russia. Of the surviving imperial elements in the present Chinese government three are of outstanding importance. The first is the system

of local government. Under this system a large measure of power is reserved for the chosen leaders of the people in the villages and cities. The authority of the local leaders depends in turn upon that of the heads of families, who under the Chinese patriarchal system were the ultimate depositories of power. This system of local self-government has not yet been destroyed by the revolution, although the revolutionary leaders are trying to replace it by a modern system of local self-government borrowed from the West. The second element derived from the ancient empire is the system of recruiting the officers of the provincial and central governments. Although the time honored competitive examinations for entrance into the government service were abolished a quarter of a century ago, the popular preference for educated men in public office continues and under the present revolutionary government operates strongly in favor of men who have received a modern education either in China or abroad. It was this class of men who finally gained control of the central government through the triumph of the Nationalist armies in 1928 and organized the new government at Nanking. The third of the ancient elements in the present political system is the profound respect for a personal symbol of political unity. Since there is now no emperor to command the allegiance of the people, Chinese revolutionists pay homage to the spirit of their late leader, Dr. Sun Yat-sen, and the people at large are learning to do the same. Thus the political ideals which Dr. Sun taught give the new Chinese nationalism the moral force by which it has become the dominant power in the land, and his program of political reconstruction tends to become the essence of the new republican constitution.

Dr. Sun's political ideals are summarized in the famous "three principles of the people," nationalism, democracy and what for lack of a better word is often translated as livelihood. What Dr. Sun seems to have meant was a social and industrial as well as political democracy. He did not expect to put all these principles into effect immediately. He believed that it would take time to train the people for the performance of the duties of citizenship in a democratic republic and also to educate their leaders in the duties of democratic statesmanship. Meanwhile the revolutionists should seize power by force if necessary and utilize the authority thus won to carry on the educational functions of the revolution. Hence the revolutionary process

would fall into three periods: military operations, political tutelage and constitutional government. The first period theoretically came to an end with the capture of Peking in 1928. Dissensions among the revolutionary generals have in fact prolonged the civil war. The adoption of the organic law of October 4, 1928, may perhaps be regarded as the first harbinger of the period of tutelage. Another step toward the substitution of a pacific for a military dictatorship was the adoption of a provisional constitution by the National Convention of the People of China, convened by the revolutionary government at Nanking in May, 1931. The institutions which Dr. Sun forecast for the period of constitutional government have not yet been set up, but the promise of their establishment is doubtless a source of strength to the present rulers of the country. Since 1928 the central government of China has been the government established in the name of the Nationalist party, or Kuomintang, by the revolutionary leaders at Nanking, and any adequate description of that government must begin with a description of the government of the party in whose name the dictatorship is operated.

The Nationalist party was created to serve as the instrument of the revolutionists at the beginning of the revolution twenty years ago, but its present constitution dates from the period of Russian influence at Canton beginning in 1923. At that time the party was reorganized upon the Communist model and every effort was exerted to make the party system strong enough to sustain the burden of the dictatorship, as in Soviet Russia. The highest organ of the party is the National Convention of Delegates, or Party Congress, which is designed to represent the members of the party in all parts of the world and to meet once in two years. It has actually met only three times, twice in Canton, in 1924 and 1926, and once in Nanking in 1929. At the last meeting there were three hundred and sixty-six delegates, of whom eighty odd were representatives of military units and nearly as many others were representatives of overseas units. The Party Congress chooses a Central Executive Committee and a Central Supervisory Committee, or Control Committee, which have powers similar to those of the corresponding committees in the Russian Communist party. The party constitution provides that the Central Executive Committee shall meet at least once every six months. In the years from 1926 to 1930 it held nine plenary sessions. This com-

mittee chooses a standing committee of from five to nine members with power to act for it during the intervals between its sessions. The Standing Committee meets once or twice a week and is the most powerful body in the national government. It seems to have been designed to occupy a position similar to that of the Political Bureau of the Central Executive Committee of the Communist party at Moscow. But the local organizations of the Nationalist party have not struck root among the industrial masses, as the Communist locals have in Russia, and the dominant influences in the local organizations are exerted by the intelligentsia and the middle classes rather than the proletariat.

The formal structure of the national government at Nanking rests upon that of the party. The most important organ of government is the Central Political Council, consisting of the members of the Central Executive and Supervisory committees, together with other prominent party leaders whom it may add to its membership. This council has the power to interpret or amend the organic act and in general to direct the policy of the central government and to choose the principal executive officers. The principal agencies of government are the State Council, consisting of twelve to sixteen members, and the five yuan. The Executive Yuan contains the administrative departments of the central government. All the principal ministers attend its meetings. The Legislative Yuan consists of a president and vice president together with from forty-nine to ninety-nine members appointed for a two-year term by the Political Council and has power to enact such measures, subject to approval by the State Council, as are not enacted by the Political Council and the Party Congress. The Judicial Yuan is the highest judicial organ of the national government. The Control Yuan was designed to audit public accounts and when necessary to impeach public officers, and the Examination Yuan was designed to test the qualifications of candidates for public office. The presidents and vice presidents of the Yuan are ex officio members of the State Council. The president of the State Council is the chief executive of the republic. He and the other members are ex officio members also of the Central Political Council. The most influential of them are likewise as a rule members of the Standing Committee of the Central Executive Committee of the party. Thus the Chinese central government, although complex, is under the control of a small group of men. It is

a political system which might be consistent with either a military or a party dictatorship.

The National Convention of the People, held in May, 1931, represented an attempt to strengthen the dictatorship by increasing the force of opinion behind the party. It was composed of 520 delegates, of whom 450 represented the provinces of China proper and the rest the principal cities within the provinces, Mongolia, Tibet and the Chinese abroad. The delegates were chosen by the peasants' unions, labor unions, the chambers of commerce, the guilds and other industrial and professional organizations, the educational institutions and the party itself. The delegates of the party were in a minority. The task of the convention was primarily to frame a provisional constitution which would define the relations between the party and the people during the period of tutelage in accordance with Dr. Sun's program of reconstruction. There were evidently great difficulties in the way. The unification of the country was only a recent and precarious achievement. The relations between the central government and the provincial governments had not been clearly defined. The authority of the central government in the provinces remained uncertain. Dissensions within the Nationalist party threatened the stability of the government at Nanking. The international settlement at Shanghai and the concessions of several powers in the leading treaty ports as well as the special privileges of the Russians and Japanese in Manchuria abridged the freedom of action of the Chinese government and impaired the administrative integrity of the country. But the Nationalist leaders maintained their confidence in the potential political capacity of the Chinese people.

The provisional constitution of 1931 confirmed the political arrangements which had already been adopted by the Nationalist party. It strengthened somewhat, at least on paper, the position of the president of the State Council, Chiang Kai-shek, who was also commander in chief of the Nationalist army, but for the most part left the existing institutions unaltered. It defined the powers of the central government, determined the relations between the government and the party and added a bill of rights for the people, but made no effective provision for securing popular rights against executive encroachment. Nor did it bring about any immediate alteration in the relations between the central government and those of the provinces and out-

lying dependencies. Most of the provinces continued under the control of military leaders whose allegiance to Nanking remained uncertain. Some were openly defiant. The authority of the central government over the Manchurian provinces and the outlying territories of Mongolia, Chinese Turkestan and Tibet was still more dubious. In Outer Mongolia a Soviet republic, established in 1921 under Russian influence, held sway and in Chinese Turkestan also Russian influences seemed paramount. In short, the unity of the republic was a legal fiction, better recognized by the powers than by many of those nominally subject to its jurisdiction. Such was the political state of China twenty years after the beginning of the revolution. Nevertheless, the revolutionary leaders professed not to be discouraged. They pointed out that similar periods of confusion had accompanied changes of dynasty in the past, and asserted that no less was to be expected in pursuance of so great a change as is involved in the transition from the ancient empire to the modern state.

GOVERNMENT EMPLOYMENT. *See* PUBLIC EMPLOYMENT.

GOVERNMENT OWNED CORPORATIONS are an adaptation of the corporate form of organization to the problems involved in the control and administration of economic enterprises owned wholly or in part by governmental entities. The corporate device has been borrowed and applied to a wide range of economic functions to which national and local governments have wished to apply the advantages of business management while at the same time subordinating the profit motive to public purposes.

Ownership and control of government owned corporations have taken three principal forms. In the United States and in Great Britain outright government ownership of all outstanding capital stock, or at least of all securities giving participation in control, and responsibility by the directors and managers of the corporation only to the government have predominated. The state trusts set up by the Union of Soviet Socialist Republics for the conduct of major industrial and commercial undertakings are similarly under complete governmental control. Secondly, in a limited number of cases governments own all or large blocks of the capital of enterprises which are leased to private operators. A third form,

especially common in Germany and France, is the so-called mixed corporation. Stock ownership and control of the mixed corporation is divided between one or more governmental entities and a private group or individual.

Governmental instrumentalities and procedures designed primarily to secure the preservation of internal peace and defense against external aggression remained for long largely unchanged, although as a result of the drastic economic reorganization of the past century governments have gradually acquired new and complex economic functions. Thus the postal service of the United States was organized along departmental lines and modeled after the departments of State, War and Navy; while in the cities of Europe government activity in the supplying of hospitals, playgrounds or municipal trading enterprises was assimilated to already existing forms of governmental organization. The disadvantages of this method of handling an ever multiplying number of economic activities soon became evident. Governmental administrative mechanisms, including those relating to methods of doing business, contracts, accounting and the selection of personnel, were intended primarily to assure the orderly conduct of routine affairs and to prevent laxity in the use of public funds. They did not lend themselves well to enterprises where flexibility and continuity were of prime importance. In many cases funds for such enterprises were subject to the vicissitudes of annual appropriation bills. Especially in the United States the economic services, like the routine departments, were subject to sudden upsets upon every change of administration, thus giving little opportunity for the development of permanent policies and of effective interrelations with non-governmental economic enterprises. The government owned corporation is one of the most recent devices for solving these difficulties. In the countries of central Europe, where municipalization of essential economic services was well under way before 1914, the difficulties had been largely overcome by such devices as the creation of autonomous departments to administer each enterprise as well as by the strengthening of the tradition of a permanent civil service. Consequently the government owned corporation has played a somewhat different part in Germany than in France or in England, where the extension of government ownership had been hindered by fears of governmental inefficiency.

A distinction must be made between the mod-

ern use of the government owned corporation and the governmental participation in corporate enterprises which occurred in most countries during the first stages of industrialization. In the United States the national government was a stockholder in the short lived first and second banks of the United States, while popular pressure for inland transportation facilities induced state governments to organize or to buy stock in canal and railroad companies and in some cases to undertake their operation. Most of the railroad systems of the world were built with the aid of large government subsidies, often in the form of stock ownership. But such ownership was not used for purposes of control; where, as in France, charters of concession contained definite stipulations as to methods of operation, it was general policy and not the fact of government participation which dictated such regulations. As private funds for capitalistic development became available, such use of public funds was abandoned. Extensive application of corporate forms to government economic services did not take place until after the development of electrical utilities and the beginnings of governmental intervention to stabilize national supplies of credit.

The establishment of central banking systems by the leading countries was attended almost without exception by some degree of governmental participation in capital ownership and in the management of organizations, which in many cases were created along corporate lines. It must be realized, however, that actual government ownership of banking corporations is rare and in the case of central banks in a sense fortuitous. Since the eighteenth century banking has been recognized as a public function and governments have not hesitated to regulate and to exercise considerable control, to the extent of appointing the board of directors, over institutions which remain privately owned. Such cases of government participation in the stock ownership of banks as have occurred were due largely to fear of inadequate sources of private capital. It was fear of such a contingency which led in the United States to the provision in the Federal Reserve Act of 1913 that the federal government could subscribe as much capital as necessary should there be a dearth of private subscriptions. The necessity did not arise; but as a result of a similar provision in the 1917 act creating the Federal Land Bank system the government took and held for about two years, until it could be disposed of to private organizations, almost

\$10,000,000 worth of stock. With a somewhat different purpose the federal government subscribed and continues to own the entire capital stock of the twelve Federal Intermediate Credit Banks established in 1923 to extend credit to agricultural cooperatives. The Commonwealth Bank of Australia was organized without share capital and is entirely controlled by the government. There are a few examples of government owned corporations in the banking field in Europe. The German states operate state banks; the only one of importance is that of Prussia, the *Seehandlung*. The municipal savings banks in Germany are operated under the corporate form; in Austria, on the other hand, savings banks may not be organized as joint stock or limited liability companies and must be set up as special institutes. The emergency situation in Germany in 1931 resulted in the government's taking over of shares of the distressed *Darmstädter und Nationalbank* and of the *Dresdner Bank*. In February, 1932, the two banks were merged into a new corporation called the *Dresdner Bank*, with capital stock of 220,000,000 marks, of which the Reich owns 150,000,000 and the *Reichsbank* 48,000,000. The Reich also owns more than half of the capital stock of the new *Kommerz- und Privatbank*. It is too soon to estimate the effect of this experiment on German banking practise, but it will probably have definite long run results.

The mixed corporation first developed in Germany in the period between 1900 and 1910 as a defensive weapon of the municipalities against the encroachments of the rapidly growing private utility companies. The most notable early case was that of the *Rheinisch-Westphalische Elektrizitätswerk A.-G. (R.W.E.)*, which, organized in 1898 and backed by *Stinnes* and *Thyssen*, was gradually establishing a network of production units and distribution lines throughout the entire Rhine-Westphalia basin. In face of this danger the municipalities of the region during the years 1906 to 1908 began to join together, sometimes with private competitors of the R.W.E., in the formation of corporations which could set up a rival distribution network. The ensuing conflict was terminated in 1908 with the intervention of the federal government and the signing of a contract whereby the various municipalities and provincial governments bought shares in the R.W.E. When in 1910 the capital of the corporation was expanded from thirty to thirty-eight million marks, the municipal and provincial governments largely covered

the new subscription. In 1912 these public bodies together held about one third of the capital of the corporation but elected fourteen out of the twenty-four members of the board of directors. Since the World War government agencies have come to own more than one half of the stock and definitely to control the policy of the company. A similar development occurred in the case of the company supplying water to the Westphalian district, in the cases of the electricity company of Hamburg and other public utility companies. In 1914 seventy-five German cities reported their interest in ninety-one mixed companies, chiefly in the fields of water distribution, gas, electricity and tramways. Since the war the Reich has begun to participate in mixed companies, particularly for the creation of large electricity networks. By 1930 about one third of the electricity supply in Germany was produced by mixed companies. Although there is wide diversity as to the amount of stock held and the degree of control exercised by public bodies in such corporations, the tendency is toward an ever increasing degree of government ownership. Indeed the mixed corporation is looked upon in many quarters as an important means of securing the representation of public interests in industries started by private capitalists—a method of socialization supplementary to direct government ownership.

Outside Germany the use of the mixed corporation although entirely a post-war development has grown to important proportions in a number of countries. In Austria the law of 1919 regulating public utilities gave the government the right to demand participation in stock ownership up to one half of the total before issuing charters or granting permission for additions to the capital of existing companies. By 1928 the city of Vienna owned stock in sixty-six mixed enterprises, chiefly in the fields of electricity and construction. Some examples of mixed companies are to be found in Hungary, Czechoslovakia and Holland. In Italy too there are numerous mixed companies, but as yet there is no general law covering their creation and special permissive legislation must be secured in each case. In France there was widespread discussion of the merits of the mixed company immediately after the war. In spite of the existence of a strong socialist movement government ownership had never become important in France, largely because of fear of administrative inefficiency. When it became evident that private enterprise alone would be inadequate to meet reconstruc-

tion needs, the mixed company was seized upon as a safe method of government participation. In 1919 and 1921 several large mixed companies were formed for the exploitation of water power resources and in 1926 a law was passed which laid down general rules for the participation of communes in private companies. As supplemented by a decree of February 17, 1930, the law provides that a commune can hold no more than 40 percent of the capital of a private company, although even if it owns only bonds it has a right to a representative on the board of directors. This provision is partly intended to prevent the communes from circumventing the rigid laws limiting their functions; it indicates also the continuance of a fear of complete government ownership.

In England there are a few special examples of mixed corporations; the most important is the Anglo-Persian Oil Company, in which the state now holds the majority of the voting stock, a control acquired by reason of special circumstances rather than because of plan. In the Central Electricity Board, to which is entrusted the unification of the distribution of electric power, England has developed a rather special kind of government corporation. Created by an act of 1926, the board is in the eyes of the law not a government administrative body but a statutory electricity undertaker. Its eight members are appointed by the minister of Transport but are legally responsible to the courts rather than to the ministry; the board has raised money by issuing stock to the public under the guaranty of the national Treasury. The British Broadcasting Company likewise is a specially constituted non-profit making corporation; it has no capital in the ordinary sense; it derives its revenue from licenses and its direction is under the supervision of the postmaster general. A better known case of government owned corporation is the Canadian National Railways. As early as 1913 the Canadian government had had to come to the aid of the Canadian Northern railroad system, in return for which it received \$40,000,000 of the \$100,000,000 of common stock and the right to appoint one director. Continued defaults and failures finally led to the creation in 1923 of the Canadian National Railways company to operate the various roads acquired by the government.

On the continent the corporation in which all stock is held by the government has developed to a position of some importance. In Germany its use originated during the war, when some

of the municipalities found it desirable to participate with private capital in the organization of the food supply or other services not already in their hands. After the war the municipalities gradually took over all the stock in such companies and continued to operate the services under the corporate form. The corporate form has also been found useful as a means of grouping several municipalities or local governmental units into a common enterprise. A similar development is taking place on a more limited scale in Hungary and Holland. In Belgium the housing shortage after the war led to the setting up of a central credit bureau, the Société Nationale des Habitations à Bon Marché, a public corporation with all its shares owned by the state. In general, however, the public housing activities carried on in Europe since the war have been administered either directly by municipal or provincial departments or by limited dividend and cooperative corporations under strict government supervision. Indeed the use of the government owned corporation in Europe is likely to be limited by the existence of other well established methods of socialization.

The experience of Soviet Russia with the "trust" throws light on the possible importance of the government owned corporation in a socialized economy. With the introduction of the NEP in 1921 one industry after another was freed from strict central control and organized into trusts, consisting of a number of factories grouped together and administered by a board appointed by the All-Union Supreme Economic Council (Vesenha) in consultation with the trade union concerned. Such trusts were created by charter and given legal status as trustees of the state. They have no share capital, their annual program of production is definitely determined by the central planning groups, and under certain conditions maximum prices may be fixed for their products; but in the matter of contracts of sale and purchase, wage agreements and similar matters they act freely as commercial enterprises. Indeed their function in the early years was to permit greater freedom of operation in a more or less free market by autonomous entities operating on a profit and loss basis. Of more temporary significance is the use of mixed companies largely as a device to secure the aid of the credit facilities of foreign firms. The general practise in 1931 was that a trading concession would be granted to a mixed company the shares of which were held half by the People's Commissariat of Trade, who ap-

pointed the chairman of the board of directors of the company, and half by a foreign firm, which appointed the managing director. Profits were equally divided between the two parties. Licenses to trade were granted to such companies on the basis of general plans for the development of foreign trade.

In the United States the development of government corporations was a result of wartime necessities and has never become a definite policy. Beginning in 1914 efforts to stimulate the development of the United States merchant marine had included projects for governmental subscription to the capital stock of a corporation "to purchase, construct, equip, maintain, and operate merchant vessels." The formation of such a corporation was viewed as a temporary device to remain in existence until private enterprise had taken over its field of activity. The Shipping Act of 1916 authorized the United States Shipping Board to form one or more corporations for this purpose and to subscribe not less than a majority of their capital stock. Immediately after the declaration of war against Germany the board proceeded to establish the United States Shipping Board Emergency Fleet Corporation, whose entire capital except for qualifying shares for the trustees was retained by the Shipping Board. This, the first of the wartime government owned corporations, was rapidly followed by a series of others created under specific congressional authorization or under emergency powers vested in the executive. To assure the effective administration and financing of urgent credit, distributive and industrial enterprises the federal government established the United States Grain Corporation to buy and sell wheat and other commodities; the War Finance Corporation to provide additional credit for industrial and agricultural operations; the Sugar Equalization Board to stabilize the price of sugar; the United States Housing Corporation to construct dwellings in war activity centers; the Spruce Production Corporation to produce aircraft materials; and the Russian Bureau, Inc., to give economic assistance to anti-Bolshevik operations in Russia. The entire capital stock and exclusive control of each of these corporations were retained by the federal government, even though the War Finance Corporation was financed largely by the sale of bonds and the Spruce Production Corporation in part through the sale of debentures to foreign governments.

The wartime corporations, which were re-

garded as temporary in character, were for the most part gradually liquidated after the Armistice. The Shipping Board was continued in existence. Under the Merchant Marine Act of 1920 the name of the Emergency Fleet Corporation was changed to the Merchant Fleet Corporation and it was given the function of operating those ships which the Shipping Board could not immediately sell to private groups and of establishing new shipping routes. On December 30, 1930, the Merchant Fleet Corporation still owned and operated 433 ships; but the intention of the government is to transfer the entire merchant marine to private interests as quickly as possible. The federal government also continued to retain the corporate form of the Panama Railroad Company, which had been purchased in 1905 in connection with the construction of the Panama Canal. Two new corporate enterprises were established in the post-war decade: the Federal Intermediate Credit Banks already mentioned and in 1924 the Inland Waterways Corporation, a reorganization of the federal inland waterways services, with full government ownership of its stock. A temporary and emergency revival of the use of the corporate form occurred in 1932 with the creation of the completely government owned Reconstruction Finance Corporation. In contrast with the short lived character of the federal government owned corporations the city of Boston acquired the privately owned rapid transit lines in its metropolitan area and modified the former private corporation into a government corporation directed by a board of trustees.

Ideally the adoption of the corporate form for the operation of government owned economic services implies almost complete divorce from the ordinary administrative organization of the government and the delegation of virtual autonomy to the directors or trustees of the corporation. This goal has been largely attained in the Central Electricity Supply Board of Great Britain, the British Broadcasting Company, the Canadian National Railways, the Boston Elevated Railway Company and the German mixed corporations. In France governmental control over the mixed corporations is intensive, even though municipalities own only minority interests. The administration of the federal government owned corporations in the United States, except for those created to extend financial credit for emergency periods, has remained closely linked to other governmental departments and their directors have been allowed little or no

independent discretion. Even in the United States, however, the federal corporations have been allowed some latitude in the handling of their accounts, in entering into contracts and in borrowing funds as well as in the selection of personnel without regard to the civil service laws applicable to other governmental agencies. Government owned corporations also have in one respect a legal status similar to that of private corporations in that generally speaking suits can be brought against them in the same manner as against private corporations. This is of more importance in the United States than in the European countries with their well developed systems of administrative law. On the other hand, thus far the United States has repeatedly refused to permit the assessment of state or local taxes against property held by the government owned corporations. A slight modification of this policy became evident in the bills to establish a corporation to operate the government electrical plants at Muscle Shoals passed by Congress in 1931, which proposed the payment of a specified annual sum to the two states, Alabama and Tennessee, directly interested in the property, in lieu of taxation by the states. In other countries there has been wide variation in tax policies. In England, Germany and Austria not only government owned corporations but enterprises run by autonomous departments of the municipal governments are subject to certain although not all of the federal taxes. Mixed corporations are subject to taxation generally. A use of the government owned corporation by municipalities or local governments might change the situation.

Despite the apparently successful functioning of corporations owned wholly or in part by governments there has been surprisingly little serious experimentation with the device in the United States. There are many services—such as the postal establishment, the Government Printing Office, various public works organizations, the Forest Service and the Boulder Dam project—which would apparently lend themselves to corporate management. The corporate form as a permanent method of administering important economic functions has been twice approved by the Congress of the United States in bills passed in 1928 and in 1931 for the operation of the Muscle Shoals project. These bills were, however, defeated by presidential vetoes. But there is gradually developing among widely diverse groups an appreciation of the advantages of government owned corporations; it is also coming to be realized that the adoption of the

corporate device is of small advantage unless the establishment of government owned corporations is attended by the formulation of and adherence to definitely conceived long range economic policies.

A., *Government Owned Corporations* (New York 1926).

GOVERNMENT OWNERSHIP of instruments of economic activity has characterized in some degree most of the economic systems of the world. Government enterprise was responsible for much of the building of antiquity; the manufacture of luxury articles as well as the provision of public works was frequently undertaken by early governments. Until the nineteenth century government ownership of certain instruments of production was as little questioned as was the necessity for government regulation of the forms of economic activity. The temporary dominance of the laissez faire philosophy both obscured the extent of government ownership and established a belief in its exceptional character in a capitalist system. Beginning with the last quarter of the nineteenth century, however, a new trend toward increased governmental activity set in. Only in Soviet Russia do government ownership and operation of the

means of production and distribution constitute the basis of the entire economic system, but even within the framework of the capitalist economy government ownership has come to occupy an increasingly important position. This position is in many cases so taken for granted that in general argument as to the merits of government ownership now arises only when its extension into fields formerly reserved for private enterprise is proposed.

While the claim that the entire enterprise of government itself should be considered as an example of public ownership is based on too broad a conception of the latter term, it is true that many of the services performed by national governments and their subdivisions would necessarily be performed by private agencies upon a commercial basis if they were not offered as public services. Even the work done by armies, navies and police has economic aspects, while that of fire departments and post offices and even more that involved in the building and maintenance of roads, bridges, parks, river and harbor improvements or public schools, colleges and libraries are economic in character. An increasing number of the special services of modern governments while they cover a wider field than could well be organized by private enterprise are essentially economic in character. Such is true of a great proportion of the work performed in the United States; for example, by the Weather Bureau, the Coast and Geodetic Survey, the Lighthouse Service, the Coast Guard, the Geological Survey, the Reclamation Service, the Bureau of Foreign and Domestic Commerce, the Department of Agriculture, the Bureau of Standards, the Forest Service and the Government Printing Office.

There are indeed few lines of economic activity which have not been undertaken by some branch of government in some part of the world. A list of enterprises in which central or local governments have engaged within recent years would perforce include abattoirs, alcoholic beverages (production and sale), arsenals, art wares (including tapestries, china, porcelain and prints), automobile filling stations, bakeries, banks, baths, bill posting services, brickyards, cables, camphor production, canals, cemeteries and crematories, cold storage plants, clothing factories, drug stores, electric light and power plants, farms, ferries, fuel yards, funeral management services, gas plants, gambling houses, grain elevators and mills, gunpowder production, harness factories, heating plants, hotels, hospitals, hous-

ing projects, ice plants, insurance projects of many kinds, ironworks, land, laundries, lotteries, markets, match industry, medical and dental clinics, milk supply, mines and quarries (coal, iron, gold, salt, chalk, stone and emerald), museums, oil wells, omnibus service, opium production, pawnshops, picture galleries, radio stations and broadcasting, railroads, recreational facilities (from golf courses to bull rings), research laboratories, restaurants, rubber plantations, spas, sewers, steamships, street railways, street paving and repairing plants, terminals, theaters and moving picture houses, tourist bureaus, telegraph and telephone systems, tobacco manufacture and sales, vineyards, waterworks and woolen mills.

In spite of the formidable diversity of this list government ownership is concentrated in certain fields. Some of the activities mentioned are represented by unique cases or by a few rare examples, such as the rubber plantations of Java, the camphor monopoly of Japan, the state vineyards of Prussia and Austria and the municipal vineyard and rathskeller of Frankfort on the Main. But for many of the categories government enterprise is the rule throughout most of the world. Thus more than one third of the railroad mileage of the world is publicly owned. In the United States, which accounts for approximately one third of the world's mileage, public ownership and operation of railroads are a negligible factor represented by one federally owned Alaskan line of something over five hundred miles, a few city belt lines and two very short roads operated by the Reclamation Service; in addition a number of the states and the city of Cincinnati own short lines which are leased to private operators. With the United States excluded, considerably over one half of the remaining railroad mileage of the world is under public ownership. In the case of telegraph systems almost every country of major importance in the world with the exception of the United States, China, Venezuela and Ecuador is committed to government ownership and operation, and government monopoly in the field of telephone service is only slightly less universal. The ownership and operation of sewage disposal systems are so much an accepted function of local government that certain private sewage systems in Texas, Argentina and Chile are commonly cited as economic curiosities. The publications of central and local government printing offices bulk large everywhere; and the Government Printing Office in Washington, D. C., is

probably the largest printing and publishing establishment in the world. City ownership of such municipal utilities as water supply systems, street railways and electric light and power plants is very common in all lands and either rivals or surpasses in magnitude private ownership in these fields. The ownership of banking and insurance facilities has been an important governmental function in European countries; and of recent years government housing projects have multiplied rapidly, particularly in England, Germany and Austria.

Even this brief review of the scope of public ownership must indicate the impossibility of formulating any neat generalization to explain adequately such a diversity of departures from free private enterprise. To a large extent one must consider each case as a particular instance. There are, however, certain general explanations for the existence of different types of government enterprise which are frequently cited and which do undoubtedly have some validity. Thus it is often urged that there is a logical case for governments to own and operate projects which turn out products that they themselves consume; such would be the arsenals operated by federal governments or the street repairing plants operated by many municipalities.

Another general contention is that governments without hostility to the principle of private enterprise may enter into the ownership of projects which furnish goods or services to the citizen consumer under a variety of extraordinary circumstances. The following are illustrative.

Governments have been moved to direct ownership where a project is of great importance to community welfare but private capital is not readily available for its undertaking. Such a condition might occur because of the scarcity of capital, the magnitude of the project or because the enterprise was not one which promised a sufficient or a sufficiently immediate return to make it attractive in the current market. Thus scarcity of capital might be offered as an explanation of many of the public enterprises in regions like India and Australasia; in such cases, however, government ownership may be little more than a method of guaranteeing security to foreign capital. Even in countries more developed industrially there are numerous enterprises, such as river and harbor improvement, ocean mapping, flood control, weather forecasting and many others, which are so difficult to adapt to profit making that they are attempted

either under government auspices or not at all. In many cases governments have taken over transit systems or other enterprises started by private capital which have proved unprofitable but which have seemed too valuable for the community to forego. Such government ownership by default while it results in adverse balances in the budget may lead to a considerable extension of government activity.

Governments may engage directly in enterprises where the exhaustion of resources which are impossible or difficult to reproduce threatens the welfare of future generations. Such a motivation is generally accepted as that which has led most of the nations of the world into a greater or less degree of preoccupation with forestry projects and with the founding and maintenance of public parks. Such projects involve also an element of long time investment needs which only governments will undertake to satisfy. The agitation which has arisen in recent years for the nationalization of the production of such wasting commodities as coal and oil has also been based in some measure upon the contention of a special need for conservation which private enterprise is not able to provide.

Government ownership may be assumed for purposes of military or political strategy. Such a consideration was at least one of the important motivations behind the building of the Panama Canal. Many railroads have been built by governments interested in their own safety, in unification or in imperialistic expansion.

The not uncommon government monopolies of tobacco and matches are to be explained largely as fiscal measures—attempts to find sources of public revenue other than taxation.

Government enterprise in certain fields has been justified on the ground that there was need of discouraging rather than promoting the use of the commodities involved. This is the chief explanation offered for the provincial control of the liquor industry practised in Canada. Other governments also have instituted public monopolies for alcoholic beverages and narcotics with the avowed purpose of encouraging restraint as well as gaining revenue.

Government ownership is urged as desirable or essential in certain fields where it is felt that profit making motives might lead to practises harmful to the public. A favorite example is community water supply, where the assurance of purity from contamination is of vital importance. But there are also industries in which competition works to the disadvantage of the

entrepreneur as well as of the consumer. In the United States since the World War it has been urged that in both the bituminous coal and oil industries there is a genuine necessity for government enterprise because of the waste and widespread bankruptcy resulting from competition.

It has long been appreciated that there are certain enterprises which are peculiarly ill adapted to organization through the workings of vigorous competition. Such industries as they are recognized come to be regarded as public utilities or are declared to be affected with a public interest. Since the ordinary safeguards are ineffective in these cases it becomes necessary to provide for them special machinery of control. Such machinery may take the form of regulation by government departments or by specially appointed commissions; or it may consist of direct assumption by a governmental agency of the ownership and operation of the enterprise either upon a monopoly basis or in competition with the private agencies remaining in the field. In the latter case it is assumed that the government enterprise will determine a plane of competition which must be met by the private enterprises if they hope to remain in business.

While the bulk of public ownership projects are explained and justified on one or more of these theoretical grounds, it is very difficult to be certain that the explanations are in any specific case actually the efficient causes of the collective action and not merely sufficient reasons for it. It is easy, for example, to explain that the public ownership of railroads which is so generally accepted in Germany, Austria, Hungary, Italy, Mexico, Japan, the British East Indies and Australasia was adopted there because of the peculiar importance of land transportation to all other economic enterprises, because the railroad industry is of necessity more or less monopolistic and because of the huge sums of capital which it requires. But immediately one is confronted with the fact that in Great Britain, Spain and the United States there is an all but complete reliance upon private ownership, while France, Canada and Argentina serve as representative examples of countries in which but a small fraction of the railroad mileage is publicly owned. In certain parts of the United States privately hired and privately paid police perform many of the functions which elsewhere are regarded as untransferable prerogatives of state agencies. Examples of private toll collecting highways, bridges and particularly ferries are far from rare.

In short, it is not safe to assume that reasons which are accepted as decisive in determining the public operation of an enterprise in one jurisdiction will be accepted as such in another. Rather it would seem that the question of whether or not an enterprise should be organized by public or private agencies is settled generally through the play of bargaining strengths of entrepreneurs, workers and consumers and by the turn of rival political fortunes within a given community. When historical chance has intrenched either public or private enterprise in a given field, then the theoretical justification for the action is developed and added as an academic accolade. Once established and justified in the public mind, either private or public ownership is generally accepted as right or even inevitable and any suggestion for change must run the gauntlet of a storm of popular protest.

Nevertheless, in a general way it is possible to trace certain almost world wide trends: a trend toward uncontrolled free private enterprise from the breakdown of mercantilism until the last quarter of the nineteenth century; and from the latter date until the outbreak of the World War an increasingly emphatic movement toward the limitation of free private enterprise in many fields, one manifestation of which was a growing amount of direct government participation in industrial pursuits. The animus of such government activity has varied from country to country and period to period. At the beginning of the twentieth century it was in many cases advocated and opposed as a step toward complete state ownership of all the means of production. In the period before the World War, however, the important manifestations of government ownership were almost entirely in the field of municipal ownership, or municipal trading as it was called in Great Britain, and the movement toward municipalization proceeded quite independently of the spread of theories of state socialism.

The reaction toward government ownership came first in the cities of Germany. Mediaeval traditions of communal landownership had never entirely disappeared in Germany and were quickly revived; by the middle of the nineteenth century many cities and towns had embarked upon successful programs of land utilization. The supplying of gas and water was often taken over by a town in connection with the lighting of the streets or the maintenance of a fire department. The movement toward government ownership was fostered by Bismarck; it obtained

the support of certain leaders of the growing Social Democratic party, the condemnation of others, who feared its association with the policies of the monarchy. But it was not so much theoretical support as evidence of profitable achievement which led to an ever wider extension of government activities. By the end of the nineteenth century city waterworks had become common; thereafter municipalization successively came to include slaughterhouses, gas works, electric power stations, street railways and in the post-war period the distribution of milk and other staples. At the present time the great majority of the public utilities of the country are owned and operated by the municipalities in which they function. Municipal ownership in Germany has gone far beyond what are ordinarily regarded as utilities—transit and the supply of gas and electricity; it involves vast housing projects, markets, production of raw materials or food products, municipal banks and insurance funds. The efficient operation of such projects has been aided by the fact that there are few restrictions placed upon municipalities by state or federal governments. Although the cities have been the most active of governmental units in engaging in such enterprises, the present German constitution authorizes direct participation in economic affairs by the Reich and the states as well as by the communes. Directly after the World War there was widespread discussion of the possibilities of socialization of all economic activity or at least of the nationalization of certain industries and the participation of workers and consumers in their operation. Short of the realization of such schemes there has been a pushing forward of government ownership. Railroads and telephone and telegraph systems are the more important of the enterprises conducted by the larger units of government. The municipalities remain the most important numerically of the government agencies in the field of electricity. Altogether about 70 percent of the electrical output of public supply undertakings in Germany is either wholly or partially owned by units of governments. The Reich directly owns and operates a small number of electric projects and is authorized to proceed much farther in the field; more important in recent years has been its participation in "mixed" companies controlling large transmission networks. These are corporations financed partly by private capital but in which various governmental units own a part, usually a majority, of the stock.

In Great Britain also municipal ownership

had become important before 1914 and at the present time many of the utilities of the country are owned and operated by public authorities, including boroughs, counties and ad hoc authorities for officially created districts and joint districts. The taking over of such enterprises was for long prevented and is still limited by restrictions on the powers of local governmental units. Not until 1875 were general powers given for the erection of water and gas works by municipalities, and there is still no power for compulsory purchase of existing plants. But in spite of such difficulties the abuses of private water companies forced government ownership. At the present time water supply systems are publicly owned in practically all regular boroughs, in about two thirds of the county boroughs and in about one half of the urban districts. Public ownership is important but less dominant in the field of gas supply, where the private companies had become more firmly entrenched before the movement for municipalization gained real momentum. A majority of the tramway systems in Great Britain are publicly owned and in the electrical field approximately 60 percent of the production is accounted for by public rather than private undertakers. There was extensive building of houses by municipalities, notably London and Manchester, before the World War but it was the pressure of the post-war housing shortage which led to extensive municipal housing projects. Government ownership in Great Britain has been in general restricted to such recognized public utilities and has not as in Germany spread to other forms of economic activity. The most important experiment of the central government has been in the electricity field, where a national scheme of coordination is administered by the Central Electricity Board, a non-profit making corporation, whose executive is appointed by the ministry of transport.

Even greater commitment to public enterprise is to be found in certain of the British colonies and dominions. The Ontario hydroelectric development in Canada has attracted wide attention. In New Zealand and Australia practically all public utilities are publicly owned. In the latter country the commonwealth government owns and operates railroads, the post, telephone and telegraph systems, radio, oil refineries and the Commonwealth Bank. The several Australian states all operate banks, railways and numerous developmental projects; and a far from complete list of government projects which have been started by one or more states would in-

clude coal mines, retail shops, agricultural colleges, stockyards, meat works, housing schemes, brickworks, pipe and reenforced concrete works, tourist bureaus, irrigation projects, canneries and butter manufactories. The public projects of Victoria have been particularly successful.

The trend toward government ownership has been strong in the Scandinavian countries. In Sweden the state generation, transmission and distribution of electricity rival private enterprise in magnitude and are increasing their relative position. In Norway government enterprise in the same field is much more dominant than in Sweden. In both these countries as well as in Denmark and Finland it is the central government rather than the municipalities which is concerned with electric power. In Finland state forestry is of importance. In Switzerland, while the federal government plays a comparatively minor role in the ownership, operation and regulation of public utilities, the cantonal and communal governments are extremely active in the field. In Basel, which is sufficiently typical in this respect, gas, electricity and water supply are city owned and operated. The street railways are also city owned and motor buses are operated privately under concessions granted by the city authorities. Throughout Switzerland the electrical industry is conducted by enterprises either wholly or partially owned by cities or cantons. Only about 10 percent of the electric production of the country derives from plants of exclusively private ownership. Austria and to a less extent Hungary are almost as completely committed to programs of government ownership as is Germany. Vienna has gone far in the municipalization of public services.

In Italy municipal ownership did not get well under way until after 1903, when new legislation gave the cities greater autonomy and opportunity for experimentation. There as in other countries, although the early movement was associated with the Socialist party program, municipalization was soon advocated by other groups. It rapidly extended to gas works, electric power and water works, tramways, slaughterhouses, street cleaning, laundries and bakeries; later ventures were made in shipping and housing. The Fascist government although in theory favoring municipal ownership has actually through its centralized bureaucratic methods and its tax program discouraged further development. Existing municipal gas and electric enterprises are, however, resisting the encroachment of private companies; and there has even

been some extension of services, notably municipal control of the milk supply. The national government has in a few cases participated through stock ownership in mixed enterprises.

In France the central government has never been completely dissociated from the conduct of industrial enterprises. Since the French Revolution, however, the relation has generally taken the form of close regulation and participation by the government in the profits of private companies rather than direct government ownership and operation. Even in the case of municipal undertakings the leasing of government owned plants, such as the gas works of Paris, to private concessionaire companies has been more common than direct operation by government departments or agencies. Since the war government ownership of a share of the stocks of private corporations has spread rapidly.

In the United States government ownership has played a less significant part. Municipal ownership of waterworks and of certain dock and harbor facilities has come to be taken for granted; municipal ownership and operation of gas and electric plants are less common. Since the war the rapid growth in size and power of the large public utility companies has even further decreased the relative importance of municipal projects in this field. On the other hand, the failures and inadequacies of regulation have led to demands for state and federal exploitation of hydroelectric resources. In the postal savings system and the parcel post the federal government operates two economic projects. The state of North Dakota is notable for its attempt to achieve a dominant place in the ownership of grain elevators, banks and public utilities in general. Since 1919 it has run a state bonding fund and state insurance funds with great success. Wisconsin has had a state life insurance fund since 1911.

Up to the present in the United States, however, the two methods most relied upon for the protection of the consumer have been the attempted enforcement of the antitrust laws and government regulation chiefly by commissions. Faith in the former is rapidly waning, while the obstacles to the latter become increasingly evident. Lack of control over capitalization and court struggles over the basis of valuation for rate making have fettered the regulatory bodies. The use of government enterprise as a substitute for commission regulation is advocated in many quarters. Members of the Massachusetts Department of Public Utilities have placed them-

selves on record as being ready to recommend a program for the general municipalization of electrical utilities in their state, if they were forced to adopt a method of valuation which seemed to be required, implicitly at least, in decisions handed down in other jurisdictions by the Supreme Court of the United States. Commissioner Joseph B. Eastman of the Interstate Commerce Commission has urged that "the substantial advantages of public ownership . . . are low cost of capital; opportunity gradually to reduce or eliminate the capital charge without hardship upon the public in the process; and above everything else . . . freedom from the evaluation nightmare." Not only has there been a growing discontent with the results obtained through commission control of utilities other than railroads, but the evidence of competent investigators would seem to show that in California, Kansas and Massachusetts the competition of municipal electric utilities has been more effective in reducing the rates charged the domestic consumer by private companies than have the public service commissions with all their regulative machinery. It is singular that the federal courts, which in the fields of anti-trust and public interest regulation have been extremely zealous in protecting the property rights of private business, have been most liberal in allowing all forms of government competition. The United States Supreme Court has upheld such activity on the part of city and state governments in the three important cases on the subject which have reached it in recent years [*Jones v. City of Portland*, 245 U. S. 217 (1917); *Green v. Frazier*, 253 U. S. 233 (1920); *Standard Oil Co. and Claude E. Shamp v. City of Lincoln*, 275 U. S. 504 (1927)]. And no better evidence of the court's tolerance in the matter could be offered than to quote a gratuitous dictum of Chief Justice Taft, who in writing the majority opinion in a case where the issue of government ownership was not directly involved [262 U. S. 537 (1923)] declared that the state may engage in "almost any private business if the legislature thinks the State's engagement in it will help the general public and is willing to pay the cost of the plant and incur the expense of operation."

But although government ownership in the United States has not thus far been checked by legal obstacles it continues to be the object of attack more virulent than that to which it has been subjected in most other countries. The typical arguments against it may be found well

summarized in an address delivered in Washington in September, 1924, by Herbert Hoover, then secretary of commerce, attacking a proposal of Senator La Follette for the general adoption of public ownership of railroads and other public utilities (Hoover, Herbert C., *Government Ownership*, address delivered in Washington, D. C., September 29, 1924). The argument runs that under a system of free private enterprise the United States has developed into the most prosperous country in the world and that government enterprise could not hope to match private business in efficiency; that government enterprise is bureaucratic and inflexible; that it fails to provide the necessary incentives for efficient management, inventiveness and experimentation; that neither the national nor the state governments are planned or equipped for the task of government operation of utilities; that the nation is too large to make government enterprise possible upon a national scale, even if there were no constitutional difficulties; that logrolling, jobbery and sectional favoritism are inherent in American politics; that public enterprises constitute a loss to government treasuries since they pay no taxes; that the best experiments in government ownership and operation elsewhere show a record of much less efficiency than similar enterprises under private operation in the United States; and, finally, that the whole socialistic idea of public ownership and operation is of foreign extraction and essentially unsuited to the American genius of rugged individualism. Similar series of objections to government enterprise were offered in the early decades of the twentieth century in other countries, but nowhere else has the emphasis on government corruption been so insistent or so pertinent as in the United States.

The defenders of public ownership commonly maintain that private enterprise is quite as corrupt and under the modern regime of corporate combinations quite as bureaucratic as public enterprise is asserted to be; that it is wasteful when competitive and autocratic when monopolistic; that it has an uncontrolled tendency to inflate its capitalization figures, which makes necessary the extraction of unduly large tariffs from consumers. Moreover a number of positive general advantages are urged for government ownership. Chief among these is the ability of governments to borrow at better terms than can private enterprise and hence their ability to work upon a lower rate base. Of similar advantage is the not uncommon governmental practise of

amortizing capital indebtedness over a number of years, after which rates may be set at a figure which will yield merely the desired revenue over current operating expenses.

None of these general arguments take into account the possible variety of forms of governmental ownership or the importance of specific political set ups. For instance, the achievements of the German municipalities have been facilitated by their extensive powers of self-government, while cities in the United States find themselves hampered by restrictions on their authority to float securities. Moreover it is not necessary that existing governmental departments be utilized in the operation of government projects. In those countries which have had long experience in government enterprise there is a tendency to set up autonomous departments for the operation of projects of a clearly commercial nature, such as electric utilities, while such social services as hospitals, parks or educational activities are managed directly by the city governing body. In the case of autonomous departments only the net results of operation are included in the city budget, thus giving to the head of the enterprise considerable administrative latitude. Somewhat different in purpose is the practise common in France and to a lesser extent in the United States whereby the government retains ownership of an enterprise but farms out its operation to a private company under more or less rigid contracts designed to insure the protection of the public interest to a degree that is not possible under ordinary regulation. A device of increasing importance in both the United States and other countries is the government owned corporation (*q.v.*). The officials of such a corporation are hired just as are those of any private business and are required to show a favorable balance sheet at the end of regular accounting periods. Thus the enterprise is divorced from the direct political control of legislators preoccupied with other matters, although the government exercises an ultimate control through its stock ownership. It is not even essential that more than a controlling interest in the voting stock of the corporation should be in government hands.

No matter what their form of organization, government enterprises are faced with certain choices of objectives; they may be run at a profit as great as that of similar private enterprises, and the funds thus accumulated used to meet the general cost of government and thus reduce taxes; or the rates of the government enterprise

may be kept so low that they barely meet or fail to meet costs. A somewhat similar choice between different values is involved in the fixing of the level of wages. Where municipalities are subject to definite budgetary and fiscal limitations, profits from municipal enterprises may offer a method of expanding the budget. Apparently this is one reason for the general commitment to operation at a profit of the cities of France, Belgium, Holland, Switzerland and Italy. At the same time a distinction seems to be made rather generally between undertakings such as the provision of hospitals, public baths, parks and since the war housing, which are of such general social utility that they must be provided at low cost even if a budgetary deficit results, and enterprises such as gas and electricity supply and tramways, which should be run at a profit to pay for the deficits on the other type of enterprise. Before the war in Germany the profits from municipal undertakings covered on the average about 12 percent of the municipal budget. A further step has been taken in Vienna since about 1923 with the inauguration of a policy of adjusting prices even of such services as electricity and gas to the income of consumers and relying upon taxation to take the place of lowered profits.

Government ownership has raised many problems as to the position of the workers. Probably in most cases hours and conditions of labor are better and wages higher in government owned enterprises than in similar private undertakings. Moreover government projects offer a high degree of security of tenure; and it has in most countries been possible for the workers to secure more effective representation and a larger share in management than in the case of private enterprises. In pre-war Germany government employees were under the formal disadvantage that the imperial industrial code did not apply to them; the municipalities, however, ordinarily set up working rules and regulations of corresponding value. A more serious disadvantage was the uncertainty as to whether or not government employees should be deprived of the right to strike. Just before the war a series of strikes by railroad workers, notably in France and Belgium, raised the problem in acute form. In a number of countries legislation was passed denying this right to workers in public utilities and setting up in its place regular arbitration procedures. At the same time the right of such workers to organize has seldom been denied. It is moreover coming to be recognized that some distinc-

tion must be made between the workers on essential public services and those in government enterprises engaged in the production or distribution of less essential goods. The magnitude of the problem is apparent when one considers that in 1930 about one eighth of the entire population of Germany was employed in government enterprises.

It would be fortunate indeed if the conflicting estimates of public and private enterprise could be resolved by the presentation of a neat statistical table, in which relative efficiencies should be set forth in items as unambiguous as British thermal units. Unfortunately no such demonstration is practicable. It is easy to marshal a long parade of inefficient public enterprises, but it is equally easy to match deficiency with deficiency from the ranks of private business. It is equally practicable to assemble enterprises of impressive efficiency from both camps. The difficulty lies in finding public and private enterprises which operate under conditions so similar that the results obtained by one may be matched fairly with those obtained by the other.

But while one cannot demonstrate whether or not government ownership advances upon its merit, it is nevertheless slowly advancing. Its outstanding successes are not confined to any one type of government. It may be significant that government ownership makes most rapid progress in times of emergency. Much of the recent interest in government ownership is an outgrowth of the widespread control of economic activity exercised by all the belligerent nations during the World War. By the end of the war not only were there in each country powerful government controls over the whole productive and distributive system, but the scope of government activity had extended beyond national boundaries in the form of inter-Allied commissions for the purchase of materials and the pooling of credit.

While the end of the war saw a return to a system of unrestricted private enterprise, the experiment of collective control has stimulated interest in the possibilities of government ownership. In Europe, where municipal ownership is an accepted fact in most countries, attention has centered on schemes for nationalization or for ownership by intermediate governmental units of privately operated industries. A conspicuous demand for nationalization was that formulated by the British coal miners and endorsed by Mr. Justice Sankey, referee to a royal commission on the subject, in a report which

recommended the state purchase of coal mines and coal royalties and the organization of a controlling body representative of workers, consumers and technical experts under the general supervision of a ministry of mines. In the United States a comparable program for the nationalization and democratic control of the railroad industry was urged by railroad workers in the so-called Plumb Plan. There has been an equally unsuccessful movement in the United States for the nationalization of the thoroughly disorganized bituminous coal industry.

At the same time there has occurred somewhat of a shift in emphasis from insistence on the importance of government ownership to recognition of the necessity for the socialization of industry as a whole through the creation of agencies in which consumers and laborers would share with producers in the running of each industry. In the immediate post-war period there were many who hoped that reconstruction might be made to strengthen rather than weaken collective controls and that collective objectives might attain a new importance. Although these hopes were frustrated, the very excesses of individual enterprise brought about a realization of the necessity of national planning and control.

The future of government ownership would seem to depend most immediately upon the future of the economic fortunes of the world. Currently from the throes of business depression has arisen an insistent demand for the undertaking of exceptional programs of public works by all governmental agencies as a relief for unemployment. In the United States there are numerous programs for state and federal organization of economic relief agencies, such as the Federal Farm Board and the Reconstruction Finance Corporation for the support of various business and financial interests. While depression persists it is certain that governments will be actively concerned with projects for aiding industry, agriculture and finance. If in any country the structure of free private enterprise collapses under the strain, it is probable that government ownership and operation in some form will play an important part in that country's economic reorganization. Short of this, government ownership perhaps under a variety of forms seems likely to extend into the industrial system of all countries with increasing rapidity.

GOVERNMENT PUBLICATIONS. The best definition of a government publication would include all documents issued by authority or with the concurrence of a government, including those of all national or international associations and conferences that receive government subsidies. Such publications are not only absolutely indispensable to democratic government but they also constitute important raw material for research in all the social sciences and present the findings of the many governmental bureaus engaged in research of all kinds. Their value, however, has been seriously limited by their lack of accessibility and the difficulty of handling them. Of the countries of the world the United States, Great Britain and Italy almost alone have united all the essential elements: centralization of printing by a government printing office, centralized distribution for sale or international exchange and the publication of complete bibliographies kept up to date by frequent supplements. Germany and Russia are making rapid and apparently efficient efforts to improve conditions. Among the greater countries France is notably backward.

Centralized printing not only effects important economies but also eliminates the confusing lack of continuity which is the principal difficulty in handling documents. Not only the titles of the publications but the very names of the issuing offices are varied with governmental changes. The words bureau, department and board may be used to cover one body or three. The author's name may be given one form on the title page and another on the binding. Sometimes the name of the individual in charge of the office wrongly appears as the name of the author; the real author is the office, not the person momentarily filling it. The opposition to centralized printing comes principally from politicians who will not easily relinquish a prerogative which is often a not inconsiderable source of patronage.

Centralized distribution, which has gone hand in hand with centralized printing, has increased the accessibility of government publications. Since 1895 all United States government publications which are for sale have been distributed through the office of the superintendent of documents in the Government Printing Office at Washington. In Great Britain printing and distribution are largely centralized through His Majesty's Stationery Office in London and its branches in Edinburgh, Manchester and Cardiff. The central distributing agency in Italy is the Libreria dello Stato in Rome, a branch of

the Provveditorato Generale dello Stato created in 1923.

Accessibility has been further increased in the United States by the system of depository libraries, over four hundred of which now exist all over the country. Begun as early as 1813 and given a definite status by legislation of 1858 and 1859, the system has been built up essentially on the basis of allowing each member of Congress to designate one depository library. In 1913 the right of congressmen to change the depository library in their districts was largely eliminated. Since 1922 the libraries have been sent only such publications as they specifically request. As a result of a convention signed in 1886 the United States exchanges publications with over sixty governments. The exchanges are directed by the Division of Documents of the Library of Congress but the actual exchange is managed by the Smithsonian Institution, whose annual *Report on International Exchange Service* (1889-) describes the current status of the exchange system.

The great mass of British publications and since 1895 of American federal documents is carefully edited, numbered, classified and indexed. British publications are divided in general into parliamentary and non-parliamentary (until 1923, Stationery Office) papers. Of the former the Command Papers, presented to Parliament "by command" of the king, are probably the most important. Various indexes and catalogues of parliamentary papers have been prepared from time to time by the two houses, and P. S. King and Son has prepared a *Catalogue of Parliamentary Papers 1801-1900* (London 1904) with supplements covering 1901-1910 (London 1912) and 1911-1920 (London 1922). The *Catalogue of Works (Other Than Parliamentary Papers and Acts of Parliament)* published by the Stationery Office (London 1921) carries the non-parliamentary publications to the date indicated. From 1898 to 1922 new parliamentary and non-parliamentary publications were listed in separate *Quarterly Lists* issued by His Majesty's Stationery Office. Since that year a *Consolidated List of Government Publications* has been issued monthly, the last issue being cumulative for the year. Although the parliamentary debates have been covered for the period from 1066 to 1803 in Cobbett's *Parliamentary History* and for the period since 1803 in the *Parliamentary Debates*, the House of Commons itself did not take over the reporting until 1909; at that time too the printing of the *Debates* was turned over to the

Stationery Office. Unlike the United States, where the system of official reporting of law cases began as early as 1803 and where every jurisdiction with few exceptions has a series of official law reports, English law reports (with the exception of those on tax cases) are not published by the government.

The publications of the United States are classified in practice as congressional, or legislative, and non-congressional. Of these the former are by far the more important; they consist of five main groups: *Journals*, the *Record*, *Documents*, *Reports*, *Bills and Laws*. The *Journals*, *Documents* and *Reports* comprise the so-called congressional set, formerly termed the sheep set because of the material used during many years for their binding. As both the Senate and the House of Representatives have their own publications, the set is made up of six distinct series. The series of *Documents* is heterogeneous and embraces many publications which are not truly congressional but emanate from the executive; until 1895 the series was subdivided into separate series of *Executive Documents* and *Miscellaneous Documents*. Each of the two *Journals* consists of one volume for each session. As the others run into a great number of separate publications they are numbered both singly and by volume; in addition a so-called serial number (beginning with the Fifteenth Congress) is given to every volume. In order to describe a congressional paper with sufficient precision it is necessary to give no fewer than five distinct particulars: the number of the Congress, the number of the session, the name of the house, the title of the series (whether *Document*, *Report* or other title) and the number within its series. Since the Sixtieth Congress, second session, the number of the session may be omitted, as the numbering of *Documents* and *Reports* was, beginning at that time, made continuous throughout an entire Congress.

The *Congressional Record* gives what professes to be a verbatim stenographic account of the proceedings in each house day by day, but the legislators have the privilege of revising or extending their remarks before publication. The *Record* was begun in 1873; its predecessors, the *Annals of Congress* (1789-1824), the *Register of Debates* (1825-37) and the *Congressional Globe* (1834-73), were only semi-official. The *Record* is issued daily during sessions of Congress, with semimonthly indexes, and is later reissued in bound volumes with a new pagination. The proceedings of one session are considered one vol-

ume, with continuous pagination, but are bound into many separate parts. The index of the *Record* is of considerable value in tracing the history of a bill or resolution, but the *Document Index* (*Index to the Reports and Documents of . . . Congress*) issued since 1897 after the close of each regular session is often much more helpful. Bills and resolutions are printed but are distributed only on specific request. The only complete collections of the vast number of bills introduced but never passed are in Washington. Bills which have been passed are printed as "slip laws" in leaflet form and are collected and printed by the State Department at the end of each Congress as *Statutes at Large*. The *Reports* series includes the reports of all congressional committees except that reports on private bills are collected in volumes which are lettered, not numbered, and which are not sent to depository libraries. As all *Reports* since the Forty-seventh Congress are numbered consecutively without regard to their contents, great gaps are thus created in library sets of congressional documents.

In spite of the immense output of congressional publications the executive departments produce three or four times as much. The variety of their output is so immense that it cannot be described here or even adumbrated. It falls roughly into four classes: annual reports, series of bulletins, circulars and general publications or monographs. The first three classes are serial, the fourth non-serial. For publications prior to 1909 the *Check-list of United States Public Documents* (3rd ed. 1911) is most useful, although the following catalogues covering specific periods are still of value: Greeley, A. W., *Public Documents of the First Fourteen Congresses 1789-1817* (United States, 56th Cong., 1st sess., Senate Document, no. 428, 1900, and *Supplement*, 1904); Poore, B. P., *Descriptive Catalogue of the Government Publications of the United States, Sept. 5, 1774-March 4, 1881* (United States, 48th Cong., 2nd sess., Senate Misc. Document, no. 67, 1885); and Ames, J. G., *Comprehensive Index to the Publications of the United States, 1881-1893* (United States, 58th Cong., 2nd sess., House Document, no. 754, 2 vols., 1905). Later publications are covered by the series of document catalogues (*Catalogue of the Public Documents of . . . Congress . . . and of Other Departments*) (1896-) and the monthly catalogue, *United States Public Documents* (since 1895). In addition various departments publish lists of their own from time to time.

The forty-eight states publish their own docu-

ments, which can generally be obtained by writing to the issuing office, but the quality and the quantity vary greatly. In general the eastern states excel considerably in both respects. Miss A. R. Hasse's "Materials for a Bibliography of the Public Archives of the Thirteen Original States" (in American Historical Association, *Annual Report*, vol. ii, 1906, p. 239-561) covers the period until 1789; Miss Hasse has also prepared an *Index of Economic Material in Documents of the States of the United States* (13 vols., Washington 1907-22) covering thirteen states. R. R. Bowker's *State Publications* (4 vols., New York 1899-1908) contains brief descriptive notes. Seventeen states have no bibliography. An excellent bibliography of current documents, the *Monthly Check-list of State Publications* (1910), is issued by the Library of Congress, with an accumulative index at the end of the calendar year. In city publications the east again leads; but some of the western cities, such as Los Angeles, devote much attention to their compilation and distribution. There is unfortunately no bibliography of municipal documents, but the Library of Congress is considering the issue of such a bibliography.

The most ambitious attempt to provide within the compass of one sole publication a *vade mecum* through the intricate field of the documents of all foreign countries is the *List of the Serial Publications of Foreign Governments, 1815-1931*, which is being edited by Winifred Gregory under the auspices of the American Council of Learned Societies, the American Library Association and the National Research Council. It is to be published in 1932. It will include national governments, governmental divisions and states which are at least to some extent self-governing, such as the states of Argentina and Brazil and the cantons of Switzerland. The Reference Service on International Affairs of the American Library in Paris has prepared a useful catalogue of the *Official Publications of European Governments* (mimeographed, Paris 1926; rev. ed. vol. i- , Paris 1929-), which, however, makes no claim to being complete. The more important catalogues for particular foreign governments are: For Italy: Italy, *Provveditorato Generale dello Stato, Pubblicazioni editte dello stato e col suo concorso (1861-1923) catalogo generale* (Rome 1924, and supplement, 1931); Libreria dello Stato, Rome, *Catalogo delle pubblicazioni* (Rome 1931). For Germany: *Monatliches Verzeichnis der reichsdeutschen amtlichen Druckschriften*, published in Berlin since 1928; Berlin, Staatsbiblio-

thek, *Deutsche amtliche Druckschriften*, published in Berlin since 1928; Germany, Reichstag, *General Register zu den stenographischen Berichten über die Verhandlungen und den amtlichen Drucksachen . . . 1867-95* (Berlin 1896), and *Register zu den Verhandlungen des Reichstags und zu den Anlagen*, from 1897 to date. For Belgium: Belgium, Commission Belge des Échanges Internationaux, *Liste des documents officiels de la Belgique* (Brussels 1912); Bacha, Eugène, *Périodiques belges* (Brussels 1928), and *Supplément* (1929); Belgium, Corps Législatif, Chambre des Représentants, *Table alphabétique décennale 1831-1911* (8 vols., Brussels 1849-1912); Belgium, Corps Législatif, Sénat, *Table vicennale alphabétique 1831-1872* (2 vols., Brussels 1854-1872). For France: Paris, Bibliothèque Nationale, Département des Imprimés, *Catalogue de l'histoire de France* (11 vols., Paris 1855-79); France, Imprimerie Nationale, *Catalogue des publications mises en vente* (Paris 1931). For the League of Nations: League of Nations, Publications Department, *Publications Issued by the League of Nations* (Geneva 1929); World Peace Foundation, *Key to League of Nations Documents Placed on Public Sale 1920-1929* (Boston 1930); League of Nations, Library, *Brief Guide to League of Nations Publications* (rev. ed. Geneva 1930).

GOVERNMENT REGULATION OF INDUSTRY. Some form of regulation of the economic activities of individuals or groups by the community appears to be virtually coextensive

with the history of organized society. Although the doctrine of non-interference enjoyed a brief supremacy—mainly in England around the middle of the nineteenth century—it has never completely governed the practise of any modern nation. There have, however, been significant changes in the kind and degree of control, in the philosophy motivating it, in the interests and ideals dominating it, in the practises dealt with, in the forms of authority exercised and in the instrumentalities employed.

In the Middle Ages prevailing theory and practise were marked by distrust of unregulated private acquisition and by a varied assortment of institutions of control in various fields. Authority derived from the church, the guilds, the town governments and the "custom of the manor." The church aside from supporting the obligation of charity prohibited usury and lent its force to the doctrine of the just price. The latter seems to have taken different forms with respect to different classes of commodities. In the case of handicraft products sold within the community of which the maker was a member it represented a protection of the customary standard of living of the maker of the goods. In the case of goods coming from a distance the community naturally assumed no responsibility for protecting the standard of living of the producers. For such goods the just price frequently meant the judgment of a body of men experienced in the trade, taking account of conditions of supply and demand. The craft guilds regulated admission to the crafts, protected standards of workmanship and limited competition between the guildsmen both in buying materials and in selling goods. The town markets, to which outsiders came to sell their goods, were regulated with a view to preventing speculation and corners and preserving direct selling. These regulations included the rules against forestalling, engrossing and regrating—an early counterpart of the laws against monopoly prominent in a much later period, particularly in the United States. Foreign traders were subjected to regulations of a generally protectionist character strongly suggesting the spirit of the later mercantilist systems. The custom of the manor defined the character and to a large extent the amount of the feudal dues and was the chief protection of the villein against arbitrary exactions on the part of the feudal lords.

When the national state took the place of the mediaeval units it continued the general attitude of distrust of free exchange and the policy of control in what it considered to be the interest of

the community. Sovereignty was now lodged in a dynastic-militaristic state with standing armies requiring large sums of money for their support, and the fiscal interests of the state naturally played a large part in the resulting system. This was colored also by the great inflow of specie from the Americas—by the wealth which Spain acquired from this source and by the attempt of other nations to divert to themselves a share of this wealth. The interest in specie led at first to direct and crude restrictions on its export, but later the restrictions were relaxed and the policy of balance of trade was substituted; this harmonized the interests of the dynastic-militaristic state, including the desire for concentration of population and wealth within its borders, with the interest of the growing mercantile class in greater freedom for their trading operations. Mercantilism involved the development of manufactures and of an excess of exports secured by importing crude products and exporting the more valuable manufactured articles. The means included direct stimulation of manufactures and attempts to foster and maintain standards of workmanship as well as systems of protective duties and restrictions on trade. Colonial empires were exploited as sources of raw materials and markets for finished goods with appropriate restrictions on colonial manufacturing. England paid special attention to the development of her navy and merchant marine, using the navigation acts to strike a heavy blow at the carrying trade of her rival, Holland, and fostering fisheries as a nursery school for seamen. In the Germanic states different economic and fiscal conditions led to less emphasis on the mercantile phases of the policy and more on the direct development of efficient methods of production; this policy and the administrative system associated with it were known as cameralism.

The general character of the early economic nationalism was undemocratic and exploitative. The masses of the population and their productive activities were regarded primarily as means for the achievement of national power and greatness; foreign trade was essentially a device to augment national power at the expense of rival states. Such considerations as the mutuality of interests involved in international trade or the greater abundance of goods for popular consumption incident to an increase of production were alien to the dominating thought of the period; they were recognized as unforeseen consequences of economic developments before being set up as conscious goals of economic policy.

The reasons for the development of a new attitude were many and complex, having their roots in the rise to power of new economic interests, in political upheavals and in changing social and political outlooks. The American and French revolutions played a large part; also the entrance into agriculture of more commercially minded landowners and the strengthening of mercantile interests in general; but undoubtedly the decisive force was the industrial revolution. Industry outgrew almost overnight many of the older forms of control, including survivals of local and guild regulations which had persisted through the early nationalist period.

The new attitude was expressed in theories of the beneficence of free private enterprise and of the perniciousness of governmental interference—it is difficult to say which aspect deserves more emphasis. *Laissez faire* theories prior to Bentham were in the main theories of natural rights, in which the correspondence between private interests and the general good was decreed by nature. In Bentham's utilitarian philosophy it was precisely the task of government to bring about this correspondence by attaching the necessary rewards and penalties to individual actions. His was a theory of public control directed to the democratic and humanitarian goal of the good of the greatest number. It is true that in Bentham's view the only control needed to this end was the maintenance of order, the protection of property and the enforcement of contracts; and he thus came to the same results as the believers in natural rights. But he had set up standards of judgment which were destined later to lead to a different answer. What had really been accomplished was the setting up of a presumption in favor of liberty in place of a presumption in favor of control and the profound modification of the standards of judgment in terms of which any proposal of control would be required to justify itself. It was perhaps most typically justified on the ground of the absence of one or more of the conditions necessary to the securing of the proper results from free enterprise. Thus the general theory of individualism was preserved, but as the point of departure for ever expanding policies of control.

In the Germanic countries the doctrines of individualism never took deep root and the cameralistic tradition persisted. The state looked with tacit approval upon and sometimes directly participated in the systematic organization of German industry into cartels; under Bismarck Germany led the world in creating a system of social

insurance. These developments were conditioned by different conceptions of the economic system and of the character of the state. British utilitarianism viewed the economic system as a more or less mechanical articulation of particular interests best cared for by the bargaining efforts of those most directly concerned. And the early British liberals with their democratic and humanitarian ideals did not find in the national government of the Napoleonic era a representative, efficient or safe custodian of economic interests. The Germanic peoples regarded the economic system more as an organic whole and had more confidence in the state as a representative of the organized community.

In the United States during the same period individualistic theory was combined with a regime of high protective tariffs. The regulation of foreign trade by a system of import duties was in fact a major form of government control of industry in many countries. It was adopted by the Germanic states even before political union had been achieved. In France it provided one of the most important issues in the field of economic policy during the nineteenth century, when the liberals regarded the protectionists and the socialists as equally dangerous adherents of state intervention. In England the repeal of mercantilistic corn laws was regarded as ushering in the period of *laissez faire*.

And yet even in England there was at no time complete adherence to the principles of *laissez faire*: the first factory acts—the earliest examples of newer forms of control—were enacted long before the middle of the century. These acts were passed in the interests of labor and were concerned with hours of work, safety and sanitary conditions; the policy which they expressed has been maintained and extended ever since. Other matters in the field of labor soon called for government regulation; of these one of the oldest, most important and most difficult was the problem of labor disputes and labor organization for the purpose of securing better terms of employment. The government could not avoid taking some position on the problem of tactics used in organized bargaining and trade disputes, if only in the course of keeping the peace. The system of regulating wages and the provision of social insurance were of equally great importance, imposing upon industry and ultimately upon the consumer the duty of maintaining minimum standards of living for the laboring masses.

The organization of employers, which in certain of its aspects is part and parcel of the ques-

tion of labor disputes, confronted the state also with a problem in another direction, that of preserving for the consumer the benefits of competition. The approach to this problem varied in time and place. While the Germanic countries encouraged combination, relying upon a variety of measures—from direct governmental participation to regulation of output and price—as safeguards against exorbitant prices, the United States attempted at first to enforce and later to regulate competition. Even before the question of economic monopoly came up, the governments in some countries were forced to deal with the problem of private operation of partial natural monopolies, such as railroads and local public utilities. The tendency of direct control over industry to expand continuously once it has been begun is well illustrated by the development of railroad regulation in the United States. Originally undertaken to prevent extortion and discrimination in rates, it was considerably extended in the course of time; so that at present the Interstate Commerce Commission engages in actual rate fixing, passes upon the issue of securities and the abandonment of old and the construction of new lines, enforces definite standards of service and is supposed to plan and supervise the consolidation of railroad systems. Developments in this field reflect also the shift of emphasis typical of government regulation as it becomes more thorough and comprehensive. In the early stages the dangers of excessive leniency and of allowing too much profit loom foremost in the public mind; later attention is centered more on the potential dangers of cutting off the capital supply of the industry, weakening the incentives to efficiency on the part of management and hindering the prompt adaptation of the industry to changing conditions.

A large number of other forms of regulation were developed during the nineteenth and the twentieth century. Many of these represent an adaptation of controls carried over from the mercantilist era to the new conditions of industrialism. The control of currency, for example, had been the prerogative of the state ever since the beginning of the modern era; after the industrial revolution this control was in most European countries focused in central banking institutions and out of their experience developed such ultra-modern doctrines as that of credit control. Similarly the regulation of corporations had from their inception been vested in the state. The strictness of these regulations varied greatly at different times and in different jurisdictions; it

seems, however, that in this field history is about to complete a circle—even in the United States, where this regulation has for a long time been very lax, the tendency appears to be toward greater strictness in many essential particulars. In the conservation of limited natural resources most of the mercantilistic forms of control still persist; recently they have been supplemented by experiments—none too successful—in the valorization of strategic products. Control of trading in foodstuffs, in some ways resembling mediaeval town regulations, covers the grading and inspection of produce and the regulation of markets. Control of consumption extends to drugs and alcoholic liquors as well as to adulteration and misbranding and the safety of foodstuffs, especially milk. Building is regulated in the interest of safety and sanitary conditions and, in some places, of architectural harmony and appropriateness. Allied to this last is the development of zoning of cities to prevent legitimate but incongruous uses of property from interfering with each other and to promote the rational development of urban areas. Even in individualistic America all these varieties of control are found to some extent and in other countries they have been carried to greater lengths.

In all of this there is scarcely anything new in principle, however bewildering the new forms which control takes or the new interests in whose service it is invoked. To the persisting mercantilistic principles of control have been added others which trace their spiritual kinship to that sense of responsibility for the standard of living of the members of the community which was one of the animating forces of the mediaeval system. The embodiment of this spirit has, however, been given new forms by the rise of new conflicts of interests and new abuses springing from new techniques of production and of commercial and industrial organization; by the substitution of democratic and progressive standards of welfare for the static, customary standards of the Middle Ages; by the contribution of science to the knowledge of human needs and the causes of human ills; and by the development of the modern representative form of government. The whole is set in the framework of a clearer recognition of the benefits of free exchange and the dangers of inept tampering with its operations, while the system of free exchange itself has become vastly more intricate and more delicately interdependent. The task of control has become far more complex and difficult than that of previous ages, and the standards

that guide it more difficult to formulate and to agree upon.

The modern system of control can be analyzed and classified in a number of different ways: according to the interests which it seeks to protect; according to the nature of the threat to these interests or the reasons for the failure of free enterprise to work the beneficial results conceived by *laissez faire* theory; according to the means employed; and according to the character of the governmental body entrusted with the employment of these means.

It is in the nature of control to be called upon where interests conflict, and the proper adjustment is often far from obvious. Generally the community will try to protect what it regards as the more vital interests, leaving the self-assertion of the less vital interests to the unobstructed interaction of economic pressures and resistances. The United States is perhaps unique in possessing in its constitutional law fairly definite criteria for distinguishing between the more and the less vital; in general it regards the interests bound up with safety, health and morals as paramount over any others which may oppose them, although not to the extent of crippling private enterprise. Thus the consumer's interest in good quality is within the sphere of state protection in so far as quality bears on safety, health or morals; while the less essential matters, such as effectiveness, durability and style, are left to his own judgment. His interest in reasonable prices is also left to competition except in the case of "public service industries," where this safeguard is obviously wanting or ineffective. One interest, however, which is essential in giving the consumer the benefits of such competition as may exist is the interest in knowledge of what the market offers. In these days of synthetic products the education of the consumer needs to go farther than ever before if he is to be able to protect his interests in the purchase of goods.

The interests of men as laborers are more varied than their interests as consumers. Here again the most vital are the interests bound up with health and safety with special regard to the needs of women and children. Less clear is the worker's interest in high wages where there is an obvious conflict with the employer's interest in cheap labor and a scarcely less obvious conflict between the interests of different groups of workers, some of whom may be anxious to get jobs at less pay than others are receiving. Here the growing practise is to set minimum standards on the theory that the public at large has an

interest in such minima and to leave any excess above these levels to the forces of supply and demand. Closely allied to the interest in wages is the interest in security both of income and employment with provision for the special needs of illness and accident. Stability of employment, however, is an interest which governments have not as yet found it practicable to protect. Nevertheless, it is clear that the interests of labor are emphasized by the modern state to an extent which never occurred to its mercantilist predecessor, while the mediaeval economic system contained nothing corresponding to the modern wage earning class. The increasing political and economic importance of this class and the growing spirit of humanitarianism have combined to bring about this result.

An analysis on the basis of the reasons for the failure of free enterprise to work beneficially must begin with the conditions necessary to such beneficial operation. These include: individuals able to determine their own interests both as producers and consumers, to organize their resources and adequately to care for them and to protect and promote them in bargaining; a system of personal and property rights which makes it impossible for any to gain by injuring others, so that every exchange must be to some extent at least a mutual benefit; and constructive competition made possible by the conditions described. Where any one of these conditions is not present the grounds of free enterprise are imperfect and corrective measures are justified, even on the basis of the utilitarian logic of the nineteenth century.

There are obviously many cases in which individuals are not able to judge or to care for their own interest. Minors not adequately cared for by their parents are wards of the state. Women are also objects of special care, not so much by reason of any special incapacity to look after their own interests as because disaster to them is injurious also to the next generation. Further there are many relations in modern economic life in which the normal individual is not in a position to look after his own interests effectively, either because he lacks necessary knowledge which is available to the community or because he is subjected to inequalities of bargaining power which amount to coercion. Moreover it is coming to be recognized that extreme poverty, whatever its cause, creates a condition in which the individual may be forced to sacrifice the needs of the future to the more urgent needs of the present to an extent which is detrimental to

the interests of the community. Community assistance is also called for wherever individuals look after their interests through "delegated agencies" or associative forms of activity, in which the active officials are responsible for other interests than their own. It is precisely this form of activity which, according to the theory of individualism, human nature is not sufficiently developed to handle successfully. The success of corporate business has given the lie to the more extreme pessimism of the economists of the early nineteenth century, but not without revealing many and grave abuses. The pseudo-individualism of large corporate enterprise is not individualism as Adam Smith or Ricardo conceived it and cannot claim the full protection of their theories.

Nor is it true that production consists solely of creating marketable goods and services and inducing individuals to undergo the costs incident to production by offering compensation which is adequate to secure their consent in a freely negotiated bargain. There are many diffused benefits which are never sold and many burdens which are imposed without specific compensation. Industrial pioneering is a matter in which the full benefits are seldom or never collected by those who have brought them into being. The evils of industrial depressions represent the results of business transactions falling in wholly untraceable ways on the economic community as a whole without the slightest possibility of bringing damage suits or collecting compensation from those who are responsible, so far as any human agency can be deemed responsible for the inevitable outcome of "legitimate" business transactions. Here all that can be done is to promote community interests and to minimize or relieve community losses on a non-individualistic basis.

Another clear ground for interference is monopoly, to which should be added many cases in which competition does not act with sufficient force or promptness to afford the individual the benefits he is supposed to receive from it. Under modern conditions the opposite extreme, cut-throat competition, is also regarded by many as a form of sickness in the competitive system, calling for some measures of relief. The cartel affords such relief to the business organization, the labor union to the workers. Both are in varying degree non-competitive and both create a need for such supervision as shall see to it that they do not exercise an oppressive degree of monopoly power.

The methods of community intervention in economic life are quite as varied and offer equally perplexing problems. They range from persuasion, as in the case of President Hoover's conferences with business leaders in the attempt to stem the depression of 1930, to far reaching compulsion, as in the case of commission control of public utilities. Undesirable practises may be prohibited, minimum standards set or absolute standards required as to both price and service. Publicity is often a formidable weapon in combating undesirable practises, and taxation is freely used to discourage various forms of business as well as to mitigate the inequalities of distribution. Arbitration of labor disputes may be voluntary or compulsory as to the submission of the dispute, as to the acceptance of the award or both.

The problem of methods of control is important where burdens are imposed simply in order to assure more desirable conditions to those engaged in the industry as well as a desirable product for the consumers. Care must then be taken that such burdens do not discourage the industry; this need is sharpened where, as in the United States, different jurisdictions set different standards for producers who must compete with each other in the same national market. That such regulation has not produced more serious disturbances is evidence that the burdens imposed have been very far from decisive. There is undoubtedly a considerable difference between imposing conditions which may incidentally increase costs of production while leaving rates of money wages and prices of products free to adjust themselves to the altered conditions, and going to the length of regulating these money payments also and leaving the employers no resource if they cannot overcome the new handicaps by increased efficiency. Where money payments are regulated, much closer consideration must be given to the law of supply and demand. But this law is not a rigid thing, and there is often a considerable margin within which control is possible without seriously handicapping production. Even the fixing of wages at a level which the least efficient employers are definitely unable to pay may operate not to check production but to hasten the transfer of the business to more competent hands—a result which competition should ultimately bring about in any case, but which may be considerably retarded, especially by forms of control over competition developed within business itself.

The type of government agency through which control is exercised varies of course with the structure of governmental machinery from country to country. This applies not so much to those forms of control which are exercised by bodies charged with general administrative functions, such as tax collecting agencies or the customs service, as to the more specific types of control, in which there has been a tendency toward the development of specialized bureaus and departments. A characteristic agency of control in English speaking countries is the administrative commission, whose functions include matters which are essentially legislative, executive and judicial and which specializes in regulating some one industry or class of problems. Labor adjustment has resulted in the joint board, representative of both sides to the controversy; it is either permanent or created for the particular occasion. For the future it may be important that business organization itself is developing representative bodies for self-regulation; these bodies increasingly acquire a governmental character with great possibilities for harm or for good according to the direction taken by the movement. If business forms of government are made adequately representative of all the essential interests involved in the various issues which arise, including political government, they may become an invaluable aid to public policy. Since the World War there has been a pronounced tendency in many European countries to incorporate such bodies in the established framework of political government and to endow them under certain safeguards with powers of compulsion. Elsewhere the assistance of the representatives of various interests and of experts is secured through the agency of advisory boards.

In the United States public control faces special legal problems. The federal constitution delegated only specifically enumerated powers to the central government, the residuary powers of state governments are also limited by the Bill of Rights, and the freedom of action of both types of governments has been further curtailed by the provisions safeguarding private liberty and private property under the Fifth and Fourteenth amendments. The courts have permitted a rather surprising extension of federal action, under authority of the few powers specifically granted, into realms characteristic of the police power reserved to the states. But they refused to permit the use of the taxing power and of the power over interstate commerce in order to enable the federal government to control child

labor. The powers of the state governments have been especially handicapped by the requirement that no person can be deprived of life, liberty or property without due process of law. Liberty and property have been so broadly defined that any effective regulation of economic affairs could be construed as a taking of these intangible values, and its constitutionality could be made dependent on whether it would be held to constitute due process. And due process has been so broadly construed as to cover the question of what subject matter the legislative power may control and what it may not. When the issue was first raised the courts held that it was not the intention to forbid types of power customarily exercised by the states, and extensions of these powers have from time to time been permitted. Judicial attempts to describe the grounds for selection have run mainly in terms of the vital character of the interests protected, justifying control in the interest of the public peace, public health and public morals with room for other matters which may be vital to public welfare. In the District of Columbia minimum wage case the court took account also of the extent of the interference with private liberty, drawing a distinction between control of the "heart of the contract"—in this instance the wage rate—and of incidental conditions. Under the progressive interpretation of the police power advocated by Justice Holmes government would have whatever powers strong and settled public conviction might decide were necessary for it. But this is not yet the law of the land.

Direct regulation of service and prices is permitted in the case of businesses "affected with a public interest." This concept covers the field of natural monopolies, certain industries on a purely traditional basis and a penumbra of other cases in which competition is an ineffective safeguard of service or price. The list is not necessarily a closed one; changed economic conditions may necessitate additions; but legislatures are not free to add any industries they choose. Thus price regulation and the positive power to require the rendering of economic services are hedged about with especially narrow limitations.

The amount and degree of control practicable in times of peace dwindle to insignificance when compared with the lengths to which control may be carried in war time, particularly during a conflict on so large a scale as the World War. War not only provides the emergency which sweeps aside all ideological and legal limitations to control; it provides the force of patriotic motive and

public opinion which puts much of wartime regulation virtually on a consent basis. Moreover war introduces a criterion of what is most essential which is quite independent of market values; no similar criterion exists in ordinary times of peace. And wartime control of prices is typically content with cutting off the peak of profiteering while still leaving profits ample to stimulate the utmost expansion of production in essential industries. There is little care to prevent profiteering in non-essentials; but when the time is ripe for effective action, supplies of fuel and materials are cut down or cut off. On the whole wartime and peacetime controls are fairly distinct. During a war the wastes and perversions of public control are less serious than the wastes and perversions to which free private enterprise would subject the warring nations; this would not, however, necessarily validate the same amount of control in times of peace.

The chief substitute for governmental control is governmental operation. This may be employed in the case of industries whose stimulation is undesirable, such as the manufacture of alcoholic liquors; or for revenue purposes; or where private enterprise will not furnish essential services; or simply as a means of furnishing service without profit. Government can secure capital more cheaply than private enterprise, but its economy of operation is commonly—not always—inferior. Thus it is peculiarly suited to cases in which capital charges are heavy and operating methods simple or well standardized. Government operation may also be used to control the charges of private business by competing with it. This method is obviously not adapted to regulating such things as wages and labor conditions. And it has a tendency to discourage private enterprise, which feels the handicap of competing against an organization that may operate at a deficit, even though private enterprise may be more efficient.

By and large, public control of business has justified itself. It is true that few of its branches have not witnessed serious perversions and abuses. The building code gives the corrupt inspector a chance for economic blackmail similar to that of the racketeer but more secure. The demagogue may attack the public utilities for the purpose of being bought off. Few trusts may be successfully dissolved and conservation of oil (on terms highly profitable to the conservers) may be temporarily prevented by the antitrust laws. Yet there is probably not a single major field of control in which the gains which have

been secured by this method would be willingly given up.

The frontiers of control are expanding. They are expanding geographically, increasing the importance of national functions as compared with those of local governments and compelling the beginnings of international regulation. And they are expanding in the range of things covered and the minuteness of regulation. The present relaxation of the application of the antitrust laws in the United States may be a symptom of a movement in the other direction, but is probably not to be interpreted so simply; it is a relaxation of one kind of control, while others are marching on. Whether one believes government control to be desirable or undesirable, it appears fairly obvious that the increasing interdependence of all parts of the economic system and such unsolved problems as the business cycle and unemployment will force more control in the future than has been attempted in normal times in the past.

GOVERNMENT REPORTING is the series of arrangements by which reports, varying from the informal to the scientific catalogue, are prepared in order to render the ponderous governmental machine visible and understandable to those who must be consulted in arriving at decisions of public direction. A knowledge of its purpose involves exploration into the three uses of reporting: administrative guidance, research into governmental problems and popular control.

Administrative or managerial reporting aims to integrate the data revealed by budgetary, cost and other accounts required for administrative control. To chart the routing of these reports from subordinates to superiors is to trace the outline of the public structure. These reports form the basic records from which are drained the research data and the public information. The International Association of Police Chiefs has installed a reporting system in approximately a thousand American cities; the recorded data are used for administrative control, for reports to the federal department of justice and for local public reports.

For research purposes a closely knit coordination of all units of government—federal, state and local—is required to create a reporting mechanism. The compilation of mortality and morbidity statistics by the federal Bureau of the Census was a piece of pioneering work that forecasts the extension of its technique into other functions. The Wickersham Commission on Law Enforcement recommended the application of the same technique to criminal statistics by the creation of registration areas composed of states and localities cooperating with the federal government in recording the operations of criminal courts. Privately the national functional associations collate at least a sampling of data by the voluntary cooperation of municipal and state officials.

Reporting to the public arises essentially from the ideal of democratic control. It is subject to a philosophical dispute, largely illusory in nature, which consists in contrasting the more exuberant claims of the democratic dogmatists with the more repulsive practises of politics. Reporting is requisite to the two essentials of democratic control, the judgment of governmental results in the decision of policy and the participation of citizens in public processes. The continuing significance of public reporting is the fact that it reveals—whatever medium is used for disseminating data—an authentic and

interpretative account of what government is, what it is doing and what it may do. Acting upon this conception four of the leading American civic associations through a Committee on Municipal Reporting have prepared specifications for use in drafting current and annual reports which record the vital operations of local government and interpret them to officials and the public.

A cross sectional view of reports in the United States according to the public divisions or units issuing them discloses certain faults and dissimilarities in reporting. In local government the reporting mechanism is a heritage from the period of American adolescence despite an economic maturity that has broken the bounds of political frameworks so as to render the scanty informality of these early methods unsuited to the present day. The town meeting, whose ineptitude as a business meeting is equaled only by its excellence as a medium for discussion, has withered even in its original setting of New England. It has a present day analogue, divorced from the minutiae of town accounts, in the meetings of civic associations, open forums and school centers. The town accounts in turn are slowly yielding to the patient attempts of city managers and commissioners to produce an intelligent dissection of local operations. Beyle's study of the Chicago area revealed that over half of its officials who might have been expected to report did practically no reporting and that much of what was done was useless.

As compared with other divisions state governments report the largest volume of data for administrators and the smallest for public use. The state governments, whose functions are departmentalized, utilize a reporting mechanism geared to yield a regular flow of annual reports and, with a recent perception of public needs, monthly and current reports instructive to citizens. Reporting has been coincident with functionalization: the blanketing of America with state tax commissions, for example, has assured the recording of the more basic tax data. American states and cities lag behind the standards set by the yearbooks of European governmental units.

National reporting is more intermittent and specialized since national administration is more removed from the voter, whose decision is apt to be upon other and more political issues. Upon these issues, it is true, national agencies utilize more skilfully than do the smaller units the devices of publicity, whether by White House

spokesmen or press agents. It is a significant fact that as the national government acquires functions intimately affecting the people, notably in agriculture and commerce, reporting is employed as an instrument of administration. The research and publicity of the Department of Agriculture are unparalleled by the work of any agency in the United States public or private.

Various types of reports may be discerned amid the practices of all units. First may be recognized the report of opinion and policy. Under this heading is included the reporting by the executive to the legislature and through that body and the press to the public. It is based in the United States primarily upon the clause in the constitution requiring the president to report from time to time on the state of the union. Probably no other clause has been invoked more successfully by the president as a lever in molding opinion and legislation. It crystallized in all branches of American government the conception that responsible offices must report periodically the conduct of their functions and recommend improvements.

The report of public problems has been largely special in authorization and functional in content. The special legislative investigating commissions have attained a wide vogue, although legislatures frequently disregard many of their findings. During the two years from 1930 to 1932 state governments named 237 special commissions or ad interim committees.

The report of financial transactions and the fiscal audit, both of which are historical institutions, fail in many respects to conform to current accounting standards. The report informs the citizen concerning the disposition of his money and the audit assures him that the money has been expended honestly and legally. Out of the fiscal audit has developed an audit of administration that attempts to diagnose governmental ills as a basis of suggestions for improvement. A tremendous impulse to the administrative audit was given by the budgetary movement. While notably successful as a device for administrative control the budget has had desultory results as a public report.

A consequence is the effort to report governmental experience by precise units of measurement of work and functions performed. Since the public accounting systems first afforded a formalistic record of work stated in fiscal terms, the effort was first directed toward the formulation of cost accounting systems. Originally con-

finned mainly to the functions of public utilities and public works, cost accounts are being installed in other functions to reveal the unit costs at which the public secures various services. Non-cost units of performance have been introduced to measure the service in terms of services rendered, materials used and personnel employed. The social values of administrative performance may be measured by such external tests as the indices of morbidity and infant mortality in the health field. Measurement aims to present a brief series of conclusions representing truthfully the huge mass of public data and to reduce the operations of government to an orderly significance. An accompanying effort, seemingly in an opposite direction but converging to the same end, is the popularization of public reports. At times popularization can be dismissed as a mere vulgarization of scientific studies into innocuous and useless statements; at its best it may be accepted as a simple, clear restatement of scientific findings that does not molest their veracity.

Reporting depends heavily upon the older distributive methods of reaching the public; the possibilities opened up by mechanical inventions have not as yet been explored. With the disappearance of the political news organ common before the Civil War, nourished by politicians and public contracts, and the personal organ which succeeded it the press now affords a standardized and impersonal avenue of reporting. In 1926 was founded the *United States Daily* as a fact reporting organ of all current activities of the national and state governments. The pattern of this journal may prove suggestive for imitation. While the radio has been utilized by public officials to enlarge tremendously the audiences to which they speak, only a scattering number of municipalities own broadcasting stations and the radio has been only slightly used as an agency for periodic official reports to the public. The moving pictures have had meager use for this purpose, although Charles and William Beard (*American Leviathan*, New York 1930) list an imposing array of pictures utilized for civic education. It is not impossible that the mechanical evolution which so altered the bases of communal life may continue to yield mechanical inventions by which public life may adjust itself to a machine age.

To energize and suggest the public interpretation of reports, official and private agencies are required to indicate the implications of the information. American political parties have not

followed the practise of a number of European parties, notably the British Labour party, in operating research bureaux to interpret the more serious public data. The many and varied American civic organizations come nearer to performing this function than do any other institutions, by scrutinizing public reports or issuing reports of their own. Their significance is that the organizations complete—by reporting in turn to the government instead of merely receiving reports—the cycle involved in the successive stages of examination, reporting, discussion and control. Reporting can exercise its function only when agencies either of private associations or of public units assume responsibility for that review and self-examination of operations implicit in democratic government.

GRACCHUS, TIBERIUS and **GAIUS**, Roman agrarian reformers. The social and political policy of the Gracchi was motivated by the desire to restore the democracy of peasant freeholders and prevent the formation of a landless proletariat. Although of aristocratic birth they wished to return to the economic system of primitive Rome. They sought to limit the possibilities of domination by the nobility by agrarian laws which tended to divide up the great landed estates among the free citizens dispossessed by the patrician class.

Tiberius Gracchus (162-133 B.C.) was elected tribune in 134 B.C. and assumed office the next year. He immediately revived the old Licinian land laws, which although they had fallen into desuetude had never been abrogated. No individual was to be permitted to hold more than five hundred jugera, with two hundred and fifty additional jugera for each of two sons. The land of the large estates over and above this limit was to be expropriated and divided among the poor citizens. Indemnification was provided to com-

pensate for useful expenditures on the land. A triumvirate was appointed to carry these laws into effect, but their work was halted by the assassination of Tiberius by the patricians.

In 123 B.C. Gaius Gracchus (153-121 B.C.) repeated the attempt of his brother. He supplemented the agrarian law with a corn law which made grain available to the citizens of the capital at a low price. He took political measures to weaken the authority of the aristocratic Senate. The patrician class rose up against him, a price was placed on his head and a slave ordered to kill him. The agrarian law of 111 B.C. abrogating all the provisions which had limited the property ownership of the patricians marked the triumph of the aristocracy, and the work of the Gracchi was reduced to nothing.

GRACE, WILLIAM RUSSELL (1832-1904), American merchant and financier. Grace was active in promoting Anglo-American economic penetration of the west coast of South America and served as mayor of New York City in 1881-82 and 1885-86. As a boy of twenty he had left Ireland and become partner in a ship chandlery at Callao, Peru, which he later reorganized as Grace Brothers and Company. It developed rapidly into an exporting and importing business with agencies in South America, the United States and England. In 1865 Grace made New York the headquarters of the firm of W. R. Grace and Company, which controlled his Peruvian and other interests and became the leading house in the west coast trade. The increasing American penetration of South America broadened the scope of Grace's operations. After the nitrate war between Chile and Peru in 1879-80 his firm secured control of the mining and railway interests of the heirs of Henry Meiggs, who

had built a series of railroads in Peru, three of which were still uncompleted at the time of his death. In attempting to secure capital for their development Grace became interested in the general credit position of Peru and engaged extensively in banking. After a three-year contest for control of the Peruvian legislature, against agents of Chile and of French bankers, Grace became the government's financial agent. In 1890 the Grace-Donoughmore contract was arranged with British bondholders; railways, guano, mining and land rights and customs control were turned over to the Peruvian Railways and Development Corporation, Ltd., which assumed payment of instalments of the Peruvian debt. A year later he organized the first regular steamship service from New York to the Pacific coast, and his firm became increasingly important in the penetration of South America. Grace was active in the promotion of Nicaraguan canal projects, president of an export lumber company and director in three American banks. Developments after the Spanish American War greatly stimulated the expansion of W. R. Grace and Company.

GRADING is the process of classifying into grades or classes of quality set up according to given criteria. It has a wide range of applications but is most commonly used to classify commodities in trade, in which sense it is often confused with standardization and simplification. While grading is classifying according to given grades, standardizing is the determining of uniformity for some practise—for example, that certain grades shall be standard—and simplification is the reducing of variety in sizes, types, models and the like.

Each case of grade making requires skilled technical research to find the qualities physically important in a commodity and social research to determine the needs of trade practise. Re-appraisals are often necessary as new varieties appear or as new recognition is given to certain characteristics. The qualities or characteristics taken into account may be illustrated by cotton grades, which are a composite of color, luster and brightness of lint; nature and quantity of foreign matter; and the preparation, or ginning.

Butter grades are based on flavor, body, color, salt and package.

The lack of uniformity in the names of given grades may be indicated by the fact that wheat is given numerical ratings, cotton such grades as Middling and Strict Low Middling and eggs such rankings as United States Special and United States Standard Dirty.

Experience has shown that grade establishment and grading are most practicable for commodities whose units have a considerable uniformity, the varieties of which are somewhat limited, the qualities of which are retained for a sufficient time to complete the marketing process and which are produced and are acceptable to consumers in a similar range of qualities and sizes from year to year so that a grade once fixed is more or less continuously applicable. To be most valuable for purposes of trading, grades must be relatively narrow. Even with narrow grades, differences of price within the grade often exist.

The grading of commodities, particularly according to standards set by an authoritative body such as a government or an organized exchange, offers trade several advantages. It makes possible the sale of goods by grade without inspection even of samples and facilitates adjustments of claims growing from losses in transit. Grading provides a technical basis for market inspection and certification services. Through these it minimizes the possibilities of exploitation by middlemen and facilitates the financing of commodities in transit and in storage by giving a recognized quality to bills of lading and warehouse receipts. For cooperative associations grading makes it possible to assure each grower a return commensurate with his contribution.

In spite of these recognized values systems of grades and grading have not been made effective for the purchase of most manufactured goods by either industrial or ultimate consumers. The almost infinite variety and the rapid change of possibilities afforded by the manufacture of new articles often make practicable classification impossible. The variety of utilities and the many price ranges required make the problem especially difficult in the field of consumer goods. The industrial consumer gives specifications—thus making his own grade—but the small purchases of the ultimate consumer can usually be made on specification only at a cost which is prohibitive. In practise the consumer relies on inspection price, on the retailer's judgment or most commonly on his own and his acquaint-

ances' experiences with brands as indicative of grades.

Commercial grade making and grading were for many years carried on by commodity exchanges and other trade groups. Commercial cotton grading has been carried on in Liverpool since about 1800, commercial grain grading in the United States since the middle of the nineteenth century. Governmental grading, long carried on by certain states for commodities important to them, is now best exemplified by the work of the United States Department of Agriculture, which in 1913 expanded its grading into a major task. The country's largest staple crops were put on an adequate grading system by the United States Cotton Futures Act of 1914 and the Grain Standards Act of 1916. These with supplementary laws promulgated official standards and required their use in all interstate transactions based on grade. The United States Warehouse Act of 1916 also required the use of these grades in transactions under the purpose of that act. Important grade making has also been done by the department in dairy and poultry products, fruits and vegetables, hay and related products, livestock, meats, tobacco, wool and canned foods. Most department grades are optional or permissive, except that certain government purchases and any inspection of farm products by federal officers are based upon them. The department provides complete inspection and certification service on all mandatory grades and in some cases on permissive grades. In other cases it issues inspecting and grading licenses to persons not employed by the government. The work of the federal government has relieved the states of concern for grades of the major staples, and some of the states have passed laws which make mandatory the federal permissive grades. State grades are still important for fruit, vegetables and eggs.

The American Standards Association, the Bureau of Standards and trade associations by determining the desirability of certain qualities of commodities and procedures contribute to the work of grading. The last sometimes set up a series of recommended grades; the last two formulate "commercial standards"; and the three cooperate in formulating so-called American Standards. Among agencies interested in grading for consumers are the Bureau of Home Economics, the American Home Economics Association, leagues supported by consumers, the so-called testing institutes of advertising media and private testing and labeling agencies. The

Bureau of Standards also assists in this field.

Although governments other than that of the United States have assumed lesser roles in grading, a tendency toward government responsibility is evident. In Canada a governmental grain commission controls grain grades. In England permissive grades have been established by the Ministry of Agriculture for beef, apples, milk and certain vegetables. Inspection and certification of these grades are not extensive. In recent years there has developed grading of fruit for export in Italy, Spain and South Africa. Some United States cotton grades have been adopted by leading European cotton exchanges; United States grades for wool have been endorsed in the British trade; and arrangements have been made with certain European countries to accept United States Department of Agriculture grades in sales of wheat to them.

The United States Food and Drugs Act of 1906 is an important grading law in the interest of the consumer in the restricted sense that it illegalizes for interstate sale "foods, drugs, medicines, and liquors" classified as "adulterated or misbranded or poisonous or deleterious." Similar types of legislation are the foreign food and drug regulatory acts, the Meat Inspection Act of 1906 and the Mapes law of 1930. The last requires that certain canned foods of low quality, even though legal for trade, must be labeled "Below U. S. Standard."

GRADOVSKY, ALEXANDER DMITRIEVICH (1841-89), Russian jurist and publicist. Gradovsky was professor of public law at the

University of St. Petersburg. Influenced by the idealism of Fichte, Hegel and Lorenz von Stein, Gradovsky qualified their ideas with those of Comte and French positivism, insisting on the necessity of studying in detail political and social realities which underlie political doctrines, although he failed to appreciate the full significance of the economic factor. In his monumental account of Russian constitutional law Gradovsky endeavored to construct the Russian autocratic regime as a legitimate not a despotic monarchy, insisting on the importance of the intermediary bodies which are subject to the law and without which the monarchical power can seldom act. In his political sympathies Gradovsky was a moderate liberal whose ideal was the "reign of law" and the inviolability of individual liberty; but he did not overlook the fact that the state also should assume positive—cultural and social—duties. An enthusiastic partisan of the great liberal reforms undertaken in the first half of the reign of Alexander II, Gradovsky wished for a slow development of the regime toward constitutional monarchy and ardently combated all overt or veiled adversaries of the enforcement of the reforms. The political reaction which took place under Alexander III threw Gradovsky into the ranks of the opposition; after the newspaper *Golos*, on which he collaborated, ceased publication, Gradovsky abandoned his activity as a publicist.

In the great struggle between the Slavophiles and the westernists, which during Gradovsky's lifetime continued to divide Russian society, he occupied an intermediate position. The Slavophiles, he believed, were right in emphasizing the specific national quality of the Russian people and the impossibility of applying western forms to its political organization without regard for its history. But they were wrong in denying any value to western civilization. The westernists in their turn were right in their criticisms of a number of Russian institutions and in their agitation for reforms, but they were wrong in ignoring the individuality of the Russian national type and in wishing to found a state devoid of national distinctiveness. Gradovsky's own views, strongly influenced by the nationalism of Fichte, pointed to a synthesis of both civilizations as the basis for a progressive national state. In this synthesis Slavophile sympathies at first predominated, as shown particularly in Gradovsky's attitude during the Russo-Turkish war of 1876-78. After 1881 he allied himself with the partisans of western civilization. The well known po-

lemic with Dostoevsky was decisive in this direction.

GRADY, HENRY WOODFIN (1851-89), American journalist and orator. Grady was a native of Georgia. As an editor of the *Atlanta (Georgia) Constitution*, he helped set the pace for modern southern journalism. Grady was the first southerner of stature to enunciate a policy of conciliation and self-reconstruction after the Civil War. The apex of his brief career was his appeal for American unity before the New England Society in New York in 1886. His contention was that early differences between Puritan and Cavalier had been fused in the typical American, as represented by Abraham Lincoln. Convinced that the southern agrarian system had proved its inadequacy, Grady advocated diversification of agriculture, localized production of necessities and personal industriousness and stressed the need for developing manufactures in the south. He was a particularly zealous champion of the fruit and forest products industries. Although his oratory was often flamboyant, his speeches and editorials nevertheless afforded concrete practical advice and stirred a wide public, winning respect in the north and directing southern energies into constructive economic channels.

GRAETZ, HEINRICH (1817-91), Jewish historian. Graetz was born in the district of Posen. He received a traditional Jewish education and later attended the University of Breslau. At first he was influenced by the neo-orthodoxy of his teacher Samson Raphael Hirsch but later he adhered to the moderately liberal "positive-historical" orientation of Zacharias Frankel, with whom he worked from 1854 as a docent of the Jewish Theological Seminary in Breslau.

Graetz' reputation as the most outstanding Jewish historian of the second half of the nineteenth century rests on his *Geschichte der Juden*

von den ältesten Zeiten bis auf die Gegenwart (11 vols., Leipsic 1853-75; tr. by B. Löwy, 6 vols., Philadelphia 1891-98). When he began his work thirty years after the publication of Jost's earlier uncritical work, he could rely upon the scholarly researches of Zuntz, Rapoport, Geiger and others; by supplementing these with his own researches based on primary sources he was able to construct a solid work of Jewish historiography instead of the "tent in the desert" erected by Jost.

Graetz possessed all the qualifications necessary for the writer of history on a grand scale: knowledge of primary sources in various tongues, a critical instinct and a constructive talent. The pathos in thirty centuries of the life of an "eternal people" inspired him as a historian. The first two volumes, dealing with the Biblical period and published after all the other volumes, bear witness to the existence of two conflicting aspirations in their author, to apply the scientific-critical method and to remain faithful to the sacred tradition.

Throughout his work Graetz took the middle course between the religious and the modern national conception of Jewish history. Sometimes he points out the national character of Diasporic history (as in the introduction to vol. v), but in his exposition he always places chief emphasis on the elements of martyrdom and learning. In both of these fields he succeeded in giving a history, systematic and critical of sources, which utilized all the material available in his time. The new Jewish historiography differs from Graetz mainly in methodology and point of view; it treats the Jewish people not merely as a special spiritual type but also as a nationality in the broad sense of the term and attempts to portray all aspects of its history, particularly the activities of its nationally autonomous communities and the social-economic preoccupations of the various classes. The newer Biblical criticism and discoveries bearing on Assyriology now make possible a more scientific account of the ancient "sacred" period of Jewish history. Graetz also ignored almost entirely the history of the largest Diaspora center in eastern Europe. But despite all its faults Graetz' work remains to this day the fundamental work of Jewish historiography and is indispensable to every new worker in this field.

GRAIN ELEVATORS. Grain elevators are warehouses in which grain in bulk is elevated by endless cup conveyors or pneumatic pipes to storage bins and from which it is discharged by gravity through shipping "legs" into cars or vessels. Country elevators first made their appearance in the grain region tributary to Chicago in the early 1860's and soon were displacing the riverside or trackside flat warehouses where grain was laboriously handled in sacks. Bulk handling through elevators utilizes the flowing properties of grain and in addition to eliminating the cost of sacks immensely facilitates the rapid receiving, grading, weighing, storage and shipment of farmers' grain during the period of heavy market movement.

From the standpoint of ownership country elevators may be distinguished as independent, "line," mill and cooperative. Line elevator systems are owned by large dealers on primary markets, who generally control terminal elevators as well. Mill elevators are located in selected areas where flour millers or cereal manufacturers choose to buy from growers directly. The farmer bringing his threshed grain to the elevator may either sell it outright on "street," accepting the buyer's grade and price; or he may have it stored with other grain of like grade, as determined by the operator; or, as is common in western Canada, he may have it stored "subject to grade" or "specially binned," with grade and dockage determined by government inspection. Street prices are generally in accordance with lists wired daily by grain dealers' associations to country points, based on the closing exchange price of the future in which country purchases are being currently hedged. When the grower stores his grain he is in a position to obtain advances against his elevator tickets, to choose his time of sale and, if he has sufficient grain in store to load a car, to consign it to a terminal commission firm, obtaining settlement on the basis of spot prices on the primary market. Line companies generally maintain commission departments operating on the exchanges. As a means of complementing the seasonal activity of grain handling, of spreading overhead costs and of attracting farmer patronage most country elevators engage in the subsidiary business of handling

bulk farm supplies (e.g. coal, lumber, cement).

Terminal elevators are located at primary markets or strategic concentration points. Here grain is received on the basis of official grade and weight, dockage is finally removed, drying or reconditioning and often mixing are carried on and seasonal storage is provided. Terminal warehouse certificates constitute the standard currency of the organized grain trade, future contracts being executed through the tender of registered receipts for grain in storage at terminal elevators designated by the exchanges concerned as regular (i.e. those delivering grain on exchange contracts). Public terminal elevators store grain not only for their operators, who are mainly line companies, but also for other persons, subject to conditions and charges regulated by governments and exchanges. Private terminals are used for the storage, conditioning and mixing only of grain belonging to their owners, who are usually grain merchants, milling, malting, linseed oil companies and the like.

Transfer elevators are located chiefly at railroad break bulk points in order to facilitate transfer to connecting lines, at water and rail transshipment points (such as Buffalo and the Georgian Bay ports) and at seaports. Grain in transfer elevators is not generally stored for sale, nor is it here given official grade inspection; it is either in process of movement to terminals for sale or having already been sold is awaiting transshipment abroad. Floating elevators are not used for storage purposes but for the running transfer and weighing, through pneumatic legs and hopper scales, of grain from barges to vessels (as between New Jersey railroad terminals and ships loading general cargo at New York berths) or from vessels to barges (as at Liverpool for continental transshipment).

Bulk handling through country elevators prevails almost exclusively in the trans-Mississippi states and in western Canada, although on the Pacific slope this method has tended to displace handling in sacks since the wartime construction of coast terminal elevators and the development of combine harvesting. It is estimated that there are about 27,000 country elevators in the United States, each with an average capacity of 17,000 bushels. In western Canada the number reported in 1930 was 5650, of which more than half were in Saskatchewan. The 509 terminal, transfer and manufacturing elevators in the United States in 1930 had a combined capacity of 430,000,000 bushels, the greatest concentration being at Minneapolis, Duluth, Chicago,

Kansas City and Buffalo. Most of these were owned by grain, milling, railroad or warehouse companies, although at New Orleans, Seattle and Tacoma public elevators have been built by port commissions. In Canada one half of the total terminal and transfer elevator capacity of 180,000,000 bushels is concentrated at Fort William-Port Arthur on Lake Superior, the remainder being distributed among inspection points in the Prairie Provinces, and lower lakes, eastern and Pacific ports, with Fort Churchill on Hudson Bay added in 1931. A large proportion of these elevators are publicly or cooperatively owned, some twenty belonging to the dominion government, various harbor commissions and the Canadian National Railways, while twelve are owned or leased by grain growers' co-operatives.

In other grain exporting countries country elevators are almost entirely lacking. In Australia and Argentina sacked grain is piled at country points under open sheds or tarpaulins, where mice ravages have at times been serious. Small terminal elevators exist, however, at certain Australian ports. Only about 10 percent of Argentina's grain exports passes through terminal elevators, located at Plata River ports and Bahía Blanca. In such cases grain from the interior has to be desacked. Lack of elevator facilities has long been a grievance of Argentine growers, and the provisional government was in 1931 negotiating with a Canadian engineering firm for the construction of a system of 600 country and terminal elevators.

The ownership of elevator facilities, particularly in the early days of the grain trade, has carried with it the possibilities of far reaching control over the marketing of grain and the returns to growers. The rapid expansion of large scale grain growing in the United States spring wheat belt after the Civil War and on the Canadian prairies after 1890 placed a tremendous strain upon the railways during the postharvest months, since slight facilities for farm storage existed. While the railroads frequently undertook the construction of transfer and terminal elevators they found it necessary as a means of speeding up the loading of cars at country points to offer special inducements to private concerns to provide elevator facilities along their lines. These took the form of leasing of elevator sites on nominal terms, of "spotting" cars for loading only from such elevators and of requiring shippers using flat warehouses or loading platforms to pay the regular elevator charges. In other

cases where railways did build elevators along their lines, rebates on the combined elevator and freight charges were often allowed to members of wheat rings who agreed to buy grain at company stations.

The most frequent grievances of growers were that they were compelled to accept the grade, dockage, weight, price and handling charges of the elevator operators, who were suspected of acting in collusion. Difficulties in securing cars for direct loading from farmers' wagons and in obtaining public storage in terminal elevators limited the opportunities for alternative outlets through consignment to primary markets or sale to independent track buyers. The granger movement of the seventies and the Grain Growers' movement in western Canada after 1900 were to a large extent actuated by farmers' complaints against railway and elevator companies.

The first state to undertake some form of public regulation of elevators in response to granger agitation was Illinois through its Warehouse Act of 1871, which required all operators of public grain warehouses to procure licenses and file bonds and to publish handling and storage rates, for which legal maxima were prescribed. The judgment of the United States Supreme Court in 1876 in the celebrated case of *Munn v. Illinois* (94 U. S. 113) sustained the validity of the Illinois law and affirmed that the operation of public grain warehouses was clothed with a public interest. This doctrine was further upheld in the subsequent cases of *Budd v. New York* in 1892 (143 U. S. 517) and *Brass v. North Dakota* in 1894 (153 U. S. 391) involving the constitutionality of statutory maximum rates.

Regulation of public terminal elevators as established in all important grain trade states today usually includes such features as the following: compulsory licensing and bonding; definition of warehouseman's responsibilities; prohibition of discrimination in charges and services; prohibition against mixing of different grades of grain belonging to persons other than proprietors of such elevators; prescription of maximum charges and of form of warehouse receipts; filing of weekly or daily statements as to grain receipts, stocks and shipments; issue of inward and outward inspection certificates by state inspectors and in some cases of weight certificates by state weighmasters. Even more intensive is the regulation exercised by the large grain exchanges over elevators classed by them as regular.

The United States Department of Agriculture began to play a part in the control of grain ele-

vators with the passage of the federal Warehouse Act of 1916 (amended in 1919 and 1923). This act covering public elevators in which grain is stored for interstate or foreign commerce is, however, not mandatory in its nature. In other words, before an operating company can become subject to the provisions of the act and do business as a federal warehouse it must make application to the secretary of agriculture for a license. In Canada elevator regulation as well as grain inspection has from the outset been a subject of federal control. The oft amended Manitoba Grain Act of 1900 was consolidated with various inspection laws to form the Canada Grain Act of 1912, and administration was placed in the hands of the federal Board of Grain Commissioners. The law embraces the regulation of country as well as terminal elevators and provides for the establishment and administration of grades, weighing and inspection.

In addition to public regulation grain growers have sought to limit the control exercised by private elevator owners through the acquisition of their own plants. Early attempts in the 1870's ended almost invariably in failure because of inadequate capital, inexperienced management and the aggressive competition of private companies. Limitation of competition in country buying through aggregation of line companies gave a renewed stimulus to the cooperative movement in the late 1880's and early 1890's, and under the inspiration of the Northwestern Farmers' Alliance numerous farmers' elevators sprang up in Iowa, Illinois and Minnesota. The federal Division of Cooperative Marketing estimated the number of farmers' elevator associations in 1929 to be approximately 4000. These had 450,000 stockholders, a total investment of \$65,000,000, handled 550,000,000 bushels annually and carried on a subsidiary supply business amounting to \$160,000,000. Where successful the cooperative elevators have brought the farmers cash, stock and patronage dividends and have had an indirect competitive influence at country points.

The chief limitation of the cooperative elevator movement in the United States has been its predominantly local, independent character. This has placed farmers' elevators at a competitive disadvantage with the strongly financed and centralized line elevator companies, which have their firmly entrenched position on primary markets as well as subsidiary control of terminal elevator facilities. There have been a few cases of limited cooperative line elevator systems in

the Dakotas and Kansas. Also in 1929 there were some twelve farmers' grain commission agencies operating on terminal markets. The Farmers' National Grain Corporation created in 1929 by the Federal Farm Board has as one of its aims the development of a national sales agency for three types of cooperative grain organizations; namely, farmers' elevator associations, terminal sales agencies and wheat pools.

In western Canada cooperative country elevators were established as units of centralized provincial systems by the cooperative elevator acts of Saskatchewan (1911) and Alberta (1913). Here government mortgage loans equivalent to 85 percent of the cost of elevator construction were made available to the respective provincial companies, conditional on stock subscription by farmers to the full amount. The plan proved highly successful. In 1926 the Saskatchewan Cooperative Elevator Company, Ltd., and the United Grain Growers, Ltd. (which had absorbed the Alberta company in 1917) operated between them some 800 country elevators and controlled as well 28 percent of the total terminal storage at the head of the lakes. The establishment of the Canadian wheat pool in 1924 was followed by the creation of subsidiary pool elevator systems in the three Prairie Provinces and the absorption of the Saskatchewan cooperative system by the pool of this province in 1926. These provincial pool elevator systems were financed through annual elevator reserve deductions from growers' returns. By 1930 the three affiliated pools had acquired 1636 country elevators as well as terminal elevator facilities of nearly 40,000,000 bushels capacity. This constituted the world's largest elevator system.

GRAINS. The cereal grasses comprise the most important group of plants in the world. The chief food grains are wheat, rice, sorghum, maize, rye, barley and oats besides several minor millets. They furnish not only the principal food of the human race but also the principal feeds of the animals on which man depends for meat, milk, eggs, leather and wool. In this double role they sustain life and are the basis of living standards.

The cereals are of ancient origin. There are several recognized criteria of the antiquity of cultivated plants, the chief being their presence in the excavated habitations of prehistoric or ancient peoples, their association with religious or other rites and ceremonies, the existence of words denoting them in Sanskrit or other root languages, the diversity of ancient cultivated forms and the absence of forms intermediate between them and existing wild species. On these bases all the important food grains except rye and possibly oats offer proof of great antiquity. Neither the time nor place of domestication of a single one of the food grains is known with certainty. Without exception excavations of the earliest habitations reveal them as cultivated crops and not as wild plants gathered for food. The primitive cultivated forms also cannot be connected conclusively with any wild species still extant. Because of the diversity of form and extensive culture of wheat and barley and to a lesser extent oats in neolithic times they must obviously have been domesticated millennia earlier.

All the major food grains except maize originated in the Old World. Maize was developed by primitive man in the tropical or warm temperate parts of the Americas. All of the Old World food grains except sorghum probably were developed in Asia. Sorghum almost certainly originated in Africa. All the Asian food grains except rice in all likelihood were developed on the treeless steppe plateau of west central Asia. Rice had its origin in the coastal swamps of southeastern Asia and perhaps also in Africa. Wheat, barley, oats and rye then, as also some minor millets, were domesticated in west central Asia or adjacent territory.

Wheat, the most important of the food grains, is likewise one of the most ancient. It comprises several groups often regarded as distinct species

or subspecies, the chief being: (a) einkorn, or one-kerneled wheat; (b) spelt and (c) emmer, with the primitive characters of fragile rachis and chaff held kernels; (d) durum, poulard, and Polish wheats, which are less primitive derivatives; and (e) the common and club wheats, forming the bulk of the commercial wheat of today. Of these groups einkorn, emmer and the common-club wheats are the oldest, being found abundantly in the late neolithic lake dwellings of central Europe and in the succeeding bronze age remains. Durum and poulard wheats apparently are warm country products not found in neolithic central Europe but abundant in the Mediterranean civilizations of ancient Egypt, Greece and Rome. The same is true of the emmers and common-clubs. Spelt is not found in the neolithic period and is not traceable in ancient languages, although occurring in Greece and Rome.

Wheats probably are derived from species of the genus *Egilops*, wild grasses of western Asia and southeastern Europe, which sometimes are placed in the wheat genus, *Triticum*. Einkorn probably derives from the wild *T. egilopoides*. Emmer may have originated from the presumably wild but exceedingly variable and perhaps hybrid *T. dicoccoides*, exploited as "wild wheat" from northern Syria. The durum, poulard and perhaps also the Polish wheats derive from emmer. The common-club group have no certain wild ancestor and may also have sprung from emmer. A wild species, *Æ. cylindrica* or *T. cylindricum*, of southeastern Europe probably is the ancestral form of spelt.

Barley, like wheat, is one of the most ancient of cultivated plants. Both six-row and two-row forms are found abundantly in neolithic and bronze age sites of central and western Europe and were extensively cultivated in ancient Egypt, Syria and Greece. A two-row wild species (*Hordeum spontaneum*) of western Asia probably is the ancestral form.

Oats apparently are of recent origin, springing from the wild *Avena fatua* of Europe, as they occur no earlier than in bronze age lake dwellings. They were known to Greece and Rome only as a barbarian crop of the north. The vernacular names, like those of barley, prove a long cultivation in northern Europe and the East.

Rye probably is the most recently developed of the important food grains. It is not found in neolithic or bronze age excavations and has no name in Sanskrit or its derivatives. It is not mentioned in ancient Chinese or Greek litera-

ture. It was known to the Romans only at the beginning of the Christian era and after its cultivation had begun in north Europe, where its names among the oldest peoples show a common origin. The wild species of the genus *Secale* are found chiefly in Russia and western Asia.

At least two millets, common and proso, occur in the neolithic lake dwellings of central Europe. They probably, although not certainly, have Sanskrit names; and one or the other was known to the ancient Chinese, Greek, Egyptian and Roman civilizations. Presumably both originated in western Asia.

Rice is of very ancient origin, as indicated by the thousands of cultivated varieties existing, its ancient culture in China and India and its Sanskrit names. The Greeks first received it through Alexander's expedition, and the Egyptians many centuries later. Wild species occur in both India and central Africa.

The origin of sorghum is not known, but its cultivation in Africa, India and northeastern China undoubtedly is ancient. Being tropical or subtropical it is not found in the neolithic or bronze age sites of Europe. It occurs in the paintings and sculpture of old Egypt and is mentioned once in the Old Testament as a bread making cereal. The fact that it was cultivated in ancient Egypt but not in India until after the Aryan invasion or in China until still later indicates African origin and a migration from west to east. Wild species are found in Africa. It has no Sanskrit names and is not mentioned by ancient Chinese or Greek authors. Its introduction into Italy from India occurred in the first century A.D.

Maize was not known until the discovery of the New World, where it was found being cultivated by the native Amerinds throughout both the continents. The immense diversity of kinds, its general geographic distribution among different native peoples, its abundant presence on pottery and in sculpture and its wide use in religious and other ceremonies all indicate a very ancient origin. No wild species exist, its nearest relatives being two species of *Euchlaena* in tropical America, from which it may have been developed ages ago.

Wheat, barley and oats have about the same soil and climatic requirements and compete with each other and with maize in its northern extension. Rye can be grown on poorer and sandier soils and somewhat farther north than these crops and therefore more nearly competes with barley and oats. Two or more of these often were

grown in a mixture called maslin. Wheat, rice and sorghum are complementary rather than competing crops and their areas overlap but little. Wheat prefers a moist, temperate climate and clay-loam land; grain sorghums can occupy land too hot and too dry for wheat; while rice requires low fertile land, a warm climate and abundant water, either by precipitation or by irrigation. In India, for instance, sorghum occupies the dry hot interior, rice occupies the low wet coastal areas and wheat occupies the high cool plateau in the north and northwest, where barley too is grown.

The seven important food grains are classified into two groups: the small grains, wheat, barley, oats, rye and rice; and the large growing sorghum and maize. The four temperate small grains, wheat, barley, oats and rye, all have been handled in about the same way since their culture began. The grain is sown directly on the field where the crop is to be produced, and no further treatment except some weeding is required until harvest. Cultural methods for these crops have been similar among primitive peoples throughout the world's history. Possibly palaeolithic man and certainly neolithic man accomplished rude seed bed preparation, or tillage, with the progenitor of the modern hoe, which as a rule was fashioned from a barbed stick or from deer antlers, shoulder blades, shells or chipped stones fastened to a wooden handle. Seeding was by hand in the soil thus loosened. Harvest at first was by hand plucking and later by the aid of a flint knife. Threshing, done at first by rubbing out the grain with the bare hand, was accomplished later by beating with a stick, the prototype of the flail.

The use of the ox as a draft animal followed the domestication of cattle and was the first great improvement, the hand hoe changing into a crude plow. Sowing was still done by hand. The short, straight harvesting blade became longer, then curved and finally fitted with a handle. With the coming of the bronze age the quality of these tools, especially the sickle, was improved and the cultivated area increased. The brush drag for smoothing and fining the rough surface was followed by the log drag and eventually by the harrow. The domestication of the ox and the horse permitted treading out the grain by use of these animals, assisted finally by an attached wooden or stone roller, later roughened or spiked. Such was the sum total of the improvements accomplished during many thousands of years. It is interesting to note that prac-

tically all of these primitive implements have persisted until the present day.

Rice differs from the other small grains chiefly in being grown under water during its juvenile stage. To prevent the plants from being choked by water loving weeds the seeds usually are sown very thickly in a specially prepared seed bed and later are transplanted by hand to the field, a tedious process possible only where labor is cheap.

Because of the much larger size of the plants sorghum and maize are grown in small groups or hills, spaced more or less regularly, rather than sown broadcast or drilled closely. This method has required cultivation to destroy weeds on the unoccupied soil. The harvesting methods of these grains also have differed in that the individual head or ear has been the unit of harvesting to the present day. Because of the large and unprotected heads of the sorghum they often have required protection from birds by the grower.

Improvement of the food grains has been in progress through many millennia. Primitive man must have had the necessary intelligence to select the larger, better flavored, better seed holding and more productive plants. Different wild strains, natural hybrids and mutants, in both wild and cultivated crops, gave him a continuing basis for selection. Modern man has added two improvements to the selection process: the ability to make artificial hybrids and to discover and apply the laws of genetics. These advances have given him an enormous advantage but not complete control over his crop plants. His major interest is to improve their quality and productivity as well as their resistance to fungous and insect pests and unfavorable climatic environment. Desirable characteristics unfortunately often are closely linked with undesirable ones.

Neolithic man learned how to grow better crops by the application of fertilizing substances, such as fish and other animal remains and manures, and he or bronze age man applied inorganic substances such as marl and chalk. Later but at least as early as Roman times were discovered the use of green manures, such as leguminous crops, and the benefits to be derived from crop rotation. Modern man has improved and extended these practises and has made original discoveries in soil tillage, seed inoculation and control of fungous diseases and insect pests.

Until recent times a large part of any population was employed in producing the needed food. The food grains required great areas as

well as an enormous quantity of hand labor for preparing the land and for sowing, harvesting and threshing the crops. The development of machinery to relieve human drudgery in grain growing has been the achievement of the past one hundred years. Within a century there have appeared to replace the wooden plow, cradle, scythe, fork, flail, winnower and scoop the following important agricultural implements and machines: the metal plow and harrow, grain and maize drills, manure and fertilizer spreaders, the mower, reaper, binder, header, combine, maize harvester, separator, cultivator, fanning mill and maize sheller. But machines are for the forward lands only, and today vast quantities of food grains still are being produced almost wholly by hand labor everywhere on the face of the earth.

Modern large scale production of food grains is dependent not only on economic ability but on physical factors as well. Among these are extensive areas of relatively clear and level land, temperate climate with moderate precipitation and the use of machinery to cut costs and to speed operations at seedtime and harvest. These conditions characterize much of the great grassland or steppe areas of the world, such as the central plain of North America, the central steppe of Eurasia (stretching from Hungary to Siberia) and the smaller plateaus of Argentina, southeastern Africa, Australia and northern India.

In the production of the staple food grains two different trends are evident under different economic conditions. One is toward the largest possible production per land unit, the other toward the largest possible production per man unit. Where population is dense and land values high, production per acre must be greatly increased, as has happened in the case of rice in Japan and in the case of wheat in Germany, England and France. Where land is abundant and population less dense, production per man unit becomes greatly increased. Such has been the history of wheat and maize growing in the United States and Argentina and of wheat growing in Canada and Australia.

The food grains are produced both for human food and for animal feed. During long millennia there have been significant changes in their kinds and uses. Barley and oats, for instance, once important human foods, now are chiefly feed-stuffs and rye and maize have succeeded them as the secondary food grains of Aryan peoples. Palaeolithic man, it is likely, ate the wild grain

seeds raw. Later the palaeolithic or neolithic cultivator probably parched the grain. Neolithic man certainly ground his grain at an early date, learning to cook porridge and bake a primitive scone on hot rocks. Modern man has added leavened bread and also given a much better quality to the other forms of cereal food.

Of all the important foodstuffs in their natural state the food grains are best adapted to commerce because of their non-perishable nature and ease of handling. With the development of settlements and the beginning of manufacture and trade there arose the necessity of transport and exchange of food grains. Since the early bronze age the only changes in methods of transport have been the slow substitution of vehicles for panniered pack animals and the increase in ship size.

Public storage in huge guarded granaries against time of scarcity was a common feature of the ancient civilized world. Here too appeared grain markets in which the millers and bakers were the chief dealers and the overlords and growers the sellers. The middleman was an early phenomenon, but through long centuries public effort was directed toward accomplishing the transfer from producer to consumer with as few intermediate steps as possible. Reselling in the same market was at first prohibited and then greatly restricted in mediaeval Europe, and stringent laws were written to prevent either the cornering of the supply or efforts to inflate prices by rumor and manipulation.

Modern merchandising of food grains, on the other hand, has assumed enormous proportions. The annual production is derived from tens of millions of individual holdings, small and large, scattered over almost every country on the earth's surface. From these farms the product trickles or flows to local markets, whence part of it moves by pack train, water or rail to more distant centers or terminal markets. Ultimately the food grains entering into commerce reach the manufacturing and deficiency areas everywhere. Only a small part, however, of the grain production of the world finds its way into international trade.

Under modern conditions, as in the United States and Canada, the grain is threshed and cleaned on the producing farm and the surplus above the needs for feed and seed is hauled by wagon or motor truck to a grain elevator at the nearest town. At this country elevator the grain is dumped mechanically into a pit from which machinery conveys it to one or another of the storage bins in the structure or directly to a wait-

ing freight car. The car when loaded, weighed and sealed moves out with others en route to another market. It may be consigned to a central agency representing the elevator owners or to a commission merchant. Commission firms or other central agencies may resell to a local or distant miller, to another dealer, to a speculator or to an importer. Practically all food grains moving in interstate commerce in the United States are inspected and graded under federal standards. Many states also apply identical or similar standards to grain in intrastate commerce. The result of such practices is to make possible safe buying without samples.

In the United States, Canada, the United Kingdom and Australia, possessing a combined population of 187,000,000 persons, or nearly 10 percent of the world's inhabitants, wheat is the staple food grain and there is now no close second. In Europe (excluding the United Kingdom) with its 500,000,000 persons wheat ranks first with rye a close second. In the densely populated subtropical and tropical portions of Asia and Polynesia rice forms the largest item in the grain diet and in fact is the chief food of probably one third of the human race. In Africa with its 150,000,000 population sorghum is the principal food grain with maize second. Sorghum likewise is a staple food grain (with rice) in large areas of central India, northeastern China and Manchuria. In Latin America (South America, Central America, Mexico and the West Indies) with a population of 110,000,000 maize takes precedence over all other cereals with wheat and rice next in order. Maize also is becoming significant in portions of south central Europe. Barley remains an important human food only in certain limited areas, notably the Mediterranean fringe of northern Africa and some localities in northern Europe. Oats nowhere now outrank any other grain as human food nor does either of the millets. In 1929-30 there were grown in the world (exclusive of China) 18,500,000,000 bushels of wheat, rye, oats, barley and maize and approximately 127,000,000,000 pounds of rice, not to mention immense but unknown quantities of sorghum.

Wheat growing today occupies a belt of latitude between 35° to 50° north in North America and Europe, with smaller areas at latitudes 30° to 40° south in South America and Australia and at higher elevations between latitudes 25° to 30° north in India. As Table I indicates, the annual world production of wheat (excluding China) was in the neighborhood of 4,500,000,000 bush-

els in the period 1927-31, an increase of about 100 percent over the crop of 40 years ago (1891-95). In the same period European production (excluding Russia) increased only 30 percent, while the combined production of the United States, Canada, Australia and Argentina increased 177 percent. In 1927-31 these new grasslands were responsible for 38 percent of world production as compared with 27 percent in 1891-95; at the same time the share of Europe (excluding Russia) declined from 45 percent to 30. The record of the war years 1915 to 1919 is of particular interest in this connection. The world's annual production during that five-year period was not materially smaller than the average annual crop of the five years preceding the outbreak of hostilities; this was due entirely to the fact that Europe's increased deficits were overcome by the expansion of wheat areas in the United States, Canada, Argentina and Australia.

TABLE I
WORLD PRODUCTION OF WHEAT, 1891-1931
(In 1,000,000 bushels)

The international trade in wheat is so general and so extensive that it links almost all the peoples of the globe. The average annual amount entering international trade is estimated at 750,000,000 bushels for the five-year period preceding the World War and at 800,000,000 bushels in the years 1926-30; these amounts constitute from 15 to 20 percent of the world production. The relative position of the principal exporting and importing countries before the war and in the last quinquennial period for which data are available is shown in Table II. It is to be noted

that in the pre-war period Russia, India, Hungary and Rumania also played an important part in the feeding of nations compelled to look abroad for portions of their food supply; in recent years, however, the contributions to the world's surplus wheat stocks made by these countries have been slight. Whether Russia will be able to recapture the commanding position it occupied in the international wheat trade in the pre-war period (its annual net exports for the five years preceding July, 1914, averaged 164,306,000 bushels) is still problematic. The needs of the principal importing countries have not changed markedly since the pre-war period and their dependence upon outside supplies is just as great, despite the vigorous encouragement which has been given domestic agriculture by public authority.

Although of tropical origin maize now has a wide temperate range, being grown principally in latitudes 30° to 45° north in the United States and as far as 48° north in Europe. It continues to be the principal food grain in much of Latin America and its popularity is growing in southern Europe and Africa. In Anglo-Saxon America it is the dominant feed grain. Thus in the United States 85 percent of the annual crop is fed to livestock, 10 percent is consumed by humans, 3 percent enters manufacture and but 2 percent is exported. The world output of maize averaged about 3,400,000,000 bushels in 1901-05

and except for the war years increased steadily to an average of 4,400,000,000 bushels in 1926-30. United States output, which in the first period amounted to 68 percent of world production, did not keep pace with this growth; by 1926-30 the United States share declined to 63 percent. On the other hand, production in Latin American and eastern European countries increased appreciably; in 1926-30 the average annual output of the principal producers in these regions was as follows (in 1,000,000 bushels):

| | |
|------------------|-----|
| ARGENTINA | 287 |
| BRAZIL (1926-29) | 159 |
| ITALY | 96 |
| JUGOSLAVIA | 120 |
| RUMANIA | 179 |
| RUSSIA | 141 |

The international trade in maize is small, comprising only from 5 to 7 percent of the annual production. In 1926-30 Argentina accounted for about 70 percent of the total entering international trade and the United States, Rumania, the Union of South Africa and Russia for most of the remainder. The leading importers are the countries of northwestern and central Europe, which use the grain for cattle (and to a lesser extent hog) feed.

Rye, a hardier winter grain than wheat, will grow in colder and more exposed places. In the United States it occurs between 40° and 50° north latitude; in Europe, from 45° to as far north as 60° latitude. It is an important foodstuff to most of the peoples of continental Europe but it is used little in other lands. Chemically similar to wheat, rye lacks an elastic gluten and therefore forms a heavier loaf. The transition from a wheat and rye diet to an exclusively wheat diet began in England fully 1000 years ago and was practically completed by the middle of the eighteenth century. On the European continent progress in this direction has been much slower. As shown in Table III the world's production (excluding China) increased from about 1,400,000,000 bushels in 1895-99 to 1,750,000,000 bushels in 1924-28, or 25 percent. Russia alone produced 54 percent of the world's crop in the earlier period and 49 percent in the later; other continental European countries account for most of the remainder. The World War, as the figures reveal, seriously curtailed production, its effect on the central European food supply being particularly marked. The proportion of the rye crop entering into world trade has been dwindling: in the immediate pre-war period 6.6 percent was exported as compared with 3.5 percent in 1926-30.

Barley was an outstanding human food in the ancient world and for a time occupied an important place in the diet of northern European peoples. Since the early part of the Christian era it has been used largely for the making of beer and more recently it came to be used as a feedstuff for livestock. In minor areas in north Africa and parts of northern Europe it is still not uncommon as a human food. In fact Algeria has 40 percent of its cropped land in this grain; in Japan the proportion is 25 percent. In pre-war United States 30 percent of the crop was used for the brewing of beer. Despite a greatly reduced use for beer making, acreage and production have grown in the post-war years; the increased output has been absorbed in stock feeding. As indicated in Table IV the world's yield of barley has grown by about 50 percent from 1895-99 to 1926-30, at the same time the share represented by the United States and Canada increased from 8 percent to 20 percent, while that of Russia declined from 20 percent to 14 percent.

The world trade in barley, as in the case of rye, has been declining. Exports for the immediate pre-war period accounted for about 14 percent of the annual crop, while in 1927-28 only 7 percent of the crop was exported. Before the war 62 percent of the world's export came from Russia, but since the war the principal exporting countries have been the United States, Canada, Argentina and Rumania. The scale of their operations, however, is much smaller than that of pre-war Russia; in fact the aggregate export of these countries is less than the amount exported by Russia alone in the years preceding the war.

While the production of Russia has been slowly mounting, the country still has far to travel to dominate again the world trade in this grain as it did in the pre-war period. The principal importing countries are Germany and the United Kingdom. Before the war Germany absorbed 54 percent of the world imports of barley; in 1926-30 its proportion declined only to 51 percent. The share of the United Kingdom in the same periods was 18 and 20 percent respectively.

Oats once were an important food grain in central and northern Europe; but in recent centuries their use as food has been negligible except in Scotland and the Scandinavian countries. On the other hand, their use for animal feed has increased enormously, particularly in Europe and North America. In the United States but 3 percent of the annual crop is milled for oatmeal and of even this small proportion a part is exported. As indicated in Table V world production (excluding China) increased 54 percent from 1895-99 to 1926-30, while European production after recovering the losses of the war and post-war years rose only 31 percent. It is to be noted that production in the United States has been declining since the war and that Russian output has practically reached the pre-war level.

The international trade in oats too has been declining. In the immediate pre-war years 5.1 percent of the annual world crop entered into export; in 1926-30 the proportion was but 2.4

percent. In the pre-war period Russia exported almost one third of all the oats entering world trade; in the 1920's its exports of the grain were insignificant. Principal exporting countries in the post-war years have been Argentina, the United States and Canada. Before the war the United Kingdom, France, Switzerland and Italy absorbed a comparatively large amount of imports; since then French imports have suffered a considerable decline.

Rice is the chief food grain of hundreds of millions of people in southern and southeastern Asia and the adjacent islands and is used although to a smaller extent throughout the world. It provides a less completely balanced ration than any other cereal, protein being almost lacking and when polished its vitamin content being almost completely destroyed. These facts largely account for the malnutrition among many rice eating peoples and the frequent havoc caused among them by deficiency diseases, particularly beriberi. Rice growing is to be found for the most part in latitudes 10° to 35° north, although there are large areas under rice in Japan as far north as 50°. Table VI indicates that the world production of rice (excluding China) was 125,-000,000,000 pounds on the average in 1922-26, an increase of 16 percent over the annual crop of the immediate pre-war period. China is an important producing and consuming country, but official statistics are not available. Unofficial estimates of the Chinese crops are as follows: 70,219,000,000 pounds in 1917; 52,788,000,000

pounds in 1920; 50,056,000,000 pounds in 1923. India has been producing from 59 percent to 56 percent of the world's rice crop (excluding China) during the immediate pre-war and post-war periods.

The world trade in rice has not changed significantly over the past twenty years; in the immediate pre-war period 11.4 percent of the crop was exported as compared with 10.6 percent in 1928, when the total export was 13,774,-000,000 pounds. The principal exporting countries have been India, Indo-China and Siam; in 1928 they accounted for over 80 percent of total exports. The principal importing countries have been China, British Malaya, Dutch East Indies, Ceylon and Japan; between them they absorbed 63 percent of total imports in 1928. Other countries which also import rice are Germany, France, the United Kingdom, Cuba and the Philippine Islands.

Sorghum is an extremely important food grain in most of Africa, in much of India, northeastern China and Manchuria and in parts of southwestern Asia. The grain is grown as far south as 30° latitude in Africa and as far north as 45° latitude in Manchuria. In India it is cultivated between 10° and 25° north and in the United States between 30° and 40°. No statistics for the crop are available for Africa and China. In India more than 25,000,000 acres (approximately one third of the rice acreage) are regularly under sorghum, the chief centers of production being the Madras and Bombay residencies and Hyderabad.

Shifts in one or all of the following three factors are likely to have important effects on the

production and consumption of the food grains: population increase (or decrease), per capita cereal consumption and cereal preference. Until recently most populations tended to grow at a rapid rate and pessimistic predictions regarding the world's future food supplies frequently were heard. In the post-war years, however, some nations already have reached a stationary population while in others the rate of increase has become slower. In general these tendencies are limited to those countries where wheat is the principal food grain. They are offset to an extent by declines in the death rate resulting from higher standards of living and better medical care. Curtailment of immigration has had a pronounced effect on the population growth of the United States, one of the largest consumers of food grains.

A decrease in the per capita consumption of food grains already is evident in the United States. Doubtless this same tendency will manifest itself in other countries if economic conditions permit. This decline in consumption seems to be due to a fundamental dietary change. Among the discernible causes are a lessening of physical labor, more abundant and all year consumption of fruits and vegetables, better heating of buildings and an increasing use of sugars. Further shifts in cereal preference also probably are in progress. In the recent past barley and oats have almost completely dropped out of the human diet and the consumption of wheat, rye and maize has been increasing. Following the same trend rye may in time be supplanted entirely by wheat and rice; sorghum and maize also may yield before the advance of wheat. All this of course is dependent upon a general rise in mankind's standards of living.

GRAMONT, SCIPION DE (d. 1638), French economist. Little is known of Gramont's life except that he was born in Provence, became secretary of the cabinet (probably an honorary title) of Louis XIII, that he gained the confidence of Richelieu and that he made several voyages to Italy, where he died. In the list of his publications are found a treatise on the rapid teaching of languages, a book on geometry, some books of verse. Haureau identifies as his an account of maritime expeditions.

In 1620 he handed to the superintendent of finance, Schomberg, a work entitled *Le denier royal, traité curieux de l'or et de l'argent* (Paris). Although this treatise was ignored or discredited by his contemporaries and has since fallen into oblivion it presents an extraordinary originality. It constituted in effect: the first fairly detailed history of money ever published; a theory of money which can be designated psycho-sociological since Gramont finds in "human judgment," in the habits of the public, the cause of fluctuations in the value of money; one of the first psychological theories of value based on the two cardinal concepts of utility and scarcity; a definitive explanation of the rise of prices in the sixteenth century in terms of a change in the value of money; and a study comparing the fiscal system and the yield of imposts of countries of

antiquity with those in countries of the seventeenth century.

GRAND JURY. The grand jury as it is now known is directly derived from the ancient *inquisitio* brought into England by the Normans. It first appeared in England, according to Maitland, as "a body of neighbors summoned by some public officer to give, upon oath, a true answer to some question." The regular use of the grand jury to discover and present persons accused of serious crime, however, may be said to date from the Assize of Clarendon in 1166. The use of this new piece of judicial machinery—presentment by a jury—came to be the most important function of the court known as the "sheriff's tourn," which emerged as a distinct court at the end of the thirteenth century. The presentments were made to a jury of twelve free-men of the hundred, who either accepted or rejected them. If they were accepted they were passed on to the sheriff, who sent those accused of more serious crimes to the itinerant justices after they had been taken into custody. The sheriff punished the lesser crimes himself by amercement.

These ancient grand juries closely resemble those of today in personnel, duties and powers. They could present either from their own knowledge or from the information of others. But as the courts of assize and quarter sessions took the place of the earlier courts, the juries came to be drawn not from the several hundreds but from the body of the county. Twenty-four jurors were summoned, out of which twenty-three were chosen; and the majority decided whether to "find a true bill" or "ignore" the accusation. The presentment of the grand jury, then as now, was merely an assertion that on the evidence of the prosecution the party presented was suspected, never that he was guilty. It was the function of the trial, or petit, jury to pass upon the question of guilt.

The other great method of accusation, the criminal "information," has a history almost as old as that of the indictment. Its underlying idea was simply that "the king by his counsel should 'inform' his courts of some fact which had legal consequences." Many kinds of "information"

developed, the chief varieties consisting either of suits by the king filed ex officio by his attorney general or suits nominally by the king but exhibited, at the relation of some private person or common informer, by the king's attorney, usually called the master of the Crown Office. The right to proceed by information rather than by presentment and indictment, however, became restricted to misdemeanors, probably by the close of the mediaeval period. The frivolous use of the ex officio information for purely personal or political objects caused the legality of this method of procedure to be called into question. But in 1690 a group of cases decisively established its legality and the abuses that had arisen were checked by legislation.

The Fifth Amendment to the United States constitution preserved the indictment in the federal courts in the case of capital or otherwise infamous crimes. In twenty-four states the constitutions or statutes now provide, with certain qualifications, that indictable offenses may also be prosecuted by information. These states are Arizona, California, Colorado, Connecticut (except for offenses punishable by death or life imprisonment), Florida (in certain counties), Idaho, Iowa, Indiana, Kansas, Louisiana (as in Connecticut), Michigan, Minnesota (except for offenses punishable by death or imprisonment for more than ten years), Missouri, Montana, Nebraska, New Mexico, North Dakota, Oklahoma, South Dakota, Utah, Vermont (as in Connecticut), Washington, Wisconsin and Wyoming. In all but a few of these states by far the majority of prosecutions are upon information. It seems to be the practise for the prosecutor to pass to the grand jury only such cases as those in which an important public interest is involved and in which he wants to show complete impartiality or certain very doubtful cases in which he permits the grand jury to assume responsibility.

In judging the relative merits of the indictment and information it should be noted first of all that the primary point of distinction between them is simply whether prosecution shall rest with the grand jury or the prosecuting attorney. The proceedings prior to this determination are usually identical. After arrest a preliminary hearing is held before a magistrate and commitment or "holding over" for trial takes place. Thereafter the prosecutor may simply file an information and proceed to trial thereon. If he proceeds by indictment, the calling of the grand jury, its examination and consideration of

the case and the drawing and filing of the indictment supervene.

The information costs less in both money and time. Dean Morse's study of the cost of one phase of the procedure by indictment—the grand jury hearing—shows that in 244 counties in selected states using the indictment the average cost per county for grand jury hearings alone for the year 1928 was \$1466. This of course constitutes merely a fraction of the true cost of the method where inefficiencies or delays are present. Statistics moreover indicate that very marked delays are occasioned by waits for grand jury action, not because of the necessity for preliminary investigation by the state or of the time which is spent by the grand jury itself in deliberation, but simply because with a grand jury meeting only at set times in the year cases accumulate. Such delay not only helps the state very little in preparing its case but results in unfortunate and friendless defendants languishing in jail, while it permits resourceful defendants to carry on their business of crime or tamper with witnesses while out on bail. In a large city like New York, where grand juries are continuously sitting, the delay is less, but it is still greater than in most of the cities where information is used.

The grand jury method is also inefficient because it involves unnecessary duplication of the preliminary hearing, at which the state is required to prove that there is reasonable cause to believe that the accused has committed a public offense. It is clearly unjust to drag witnesses before the grand jury for an exhaustive hearing of evidence which has already been presented at the preliminary hearing. In most cases the evidence presented at the grand jury hearing is practically all voluntarily given and would be just as freely given to the prosecutor himself without legal compulsion. It is sometimes contended, however, that a grand jury hearing protects the prosecution from revealing the nature of its evidence to the defense, but in fact a prosecuting attorney at a preliminary hearing has simply to show that there is probable cause to believe the prisoner to be guilty. If the prosecutor is frequently forced to prove his case beyond a reasonable doubt, it is because the power placed within the reach of the average grand jurymen is often abused. He is unable either to direct his questions to genuine relevancies or to form a definite judgment as to the value of the evidence presented. Grand jurors need constantly to be warned that they are not conduct-

ing a trial. Moreover they frequently imperil the people's case by breaking their oath of secrecy.

In theory the grand jury system protects persons against the expense and embarrassment of a public trial, but actually it results in the accusation of many innocent persons. Available statistics show that the information is better suited to the selection of really meritorious cases. Under it there are a larger proportion of convictions and more pleas of guilty to the offense charged. Great numbers of indictments seem to be returned every year in which the prosecutor is unable to prove the crime as serious as charged, but less "bluffing" seems to be done with the information than with the indictment. Whether this is because the prosecutor feels less responsible when the latter is used is a debatable question.

Unless a grand jury is provided with unusual experience and competence in its membership, the prosecutor becomes absolute master of its decisions. In a process which usually depends entirely on matters of legal definition the sole legal adviser of the civilian grand jury is able to have his way in nearly every case. The feeling of the jury that it is acting independently is illusory. Even when the jury itself contains sufficient leadership to control the prosecutor its triumph is short lived, because the prosecutor can accomplish his purpose by a subsequent *nolle prosequi* or some other method of disposing of the case. Thus the function of the grand jury is merely to provide a means by which the prosecutor may, while exercising his own discretion and enforcing his own will, escape responsibility.

Modern conditions have rendered obsolete not only the accusatory but the investigatory powers of the grand jury. The modern system of police is better suited to criminal investigation. The existence of the grand jury as an inquisitorial body may, however, have a wholesome effect upon the community. Its broad power to summon witnesses whose testimony is not confined to narrow legal questions, as in the case of a court inquiry, makes it of inestimable value where a state of public corruption exists and widespread inquiry seems desirable. Although it is probably not the ideal organ for the purpose it seems at the moment the most available instrument.

A slowly growing dissatisfaction with the cumbersome and ineffective work which the grand jury performs seems to have consigned the once powerful institution to an ever declin-

ing importance. France, which adopted the grand jury after the revolution, abolished it after a short period of experiment. The grand jury as an instrument for the routine work of initiating prosecutions is being supplanted by the public prosecutor.

GRANGE. The Grange, or Patrons of Husbandry, a secret fraternal society open to both men and women, was founded in 1867 by Oliver H. Kelley and six associates, all but one of whom were government clerks in Washington. The purpose of the founders was to give to farmers in the United States opportunities for social intercourse and intellectual advancement. The constitution provided for local granges, state granges and a national grange, the last two being delegate bodies; later, provision was made for county granges. Although the farmers at first regarded the Grange with suspicion or indifference, during the agricultural depression of the seventies they joined it in large numbers and took control of the national association. From the spring of 1873 to the fall of 1874 the number of local granges rose from 3360 to 20,365, most of them located in the middle west and the south. The Grange gave its name to and became a significant factor in the granger movement—the first stage of the agricultural uprising of the seventies against the new industrialism which threatened pioneer democracy.

Up to this period in the history of the United States it had been possible for the farmer in straitened circumstances to move west and take up new land. Beginning with the seventies, however, it became difficult to obtain land suitable to the old type of pioneer self-sufficing agriculture, and the farmer on the new frontier found himself fully as dependent as the eastern farmer on prices, transportation facilities and marketing agencies. Early enthusiasm for the expansion of railroad systems gave way to a demand for pub-

lic regulation when it appeared that the high rates made impossible a "reasonable" producers' profit and were accompanied by abuses in the management of railroad corporations, such as construction rings, watered stock, free passes and discriminatory rates. Especially in the south the credit system often kept the farmer at the mercy of the local merchant; high interest rates on mortgages and an appreciating currency added to his troubles. Confronted with declining prices for their products, the farmers of the west and south sought through the Grange and other agencies to reduce transportation costs and to eliminate middlemen.

Many farmers believed that the remedy for their ills was to be sought in political action; but, lacking organization and accustomed to divide their votes on bygone issues, they found themselves without political influence. The Grange was nominally non-political, but it served as a medium of organization and discussion and paved the way for the rise of independent, anti-monopoly or farmers' parties in eleven western states, some of which won victories through fusion with the minority party. The principal result of this political upheaval was the passage of acts regulating railroad rates in Illinois, Minnesota, Iowa and Wisconsin. Although most of these "granger laws" were repealed or greatly modified in a few years, their testing before the United States Supreme Court in the "granger cases" laid the basis for future railroad regulation.

To effect the elimination of middlemen the grangers established purchasing agencies and cooperative stores, some of which did a large business for a few years and undoubtedly saved money for members and other consumers. The opposition of local merchants, coupled with ignorance and inefficiency on the part of the Grange agents, hampered these enterprises, and the attempts of the National Grange and some of the state granges to enter the field of cooperative industrial production by manufacturing agricultural machinery on a large scale were disastrous. Fear of responsibility for debt caused the disbandment of granges, and in the late seventies the order declined rapidly in those states where formerly it had flourished most vigorously.

Although the granger program was regarded as radical and visionary, many of the measures which it advocated, such as railroad regulation, antitrust laws, income taxes, popular election of United States senators, parcel post and postal

savings banks have since been enacted. Moreover, it established the idea that the farmers could advance their interests by organization, and the Farmers' Alliance, which spread through the west and the south in the eighties, was modeled to a large extent upon the Grange. It likewise influenced farmers' organization in Canada. The independent political movements associated with the Grange demonstrated the possibility of effective political action by farmers and forced the major parties to give more consideration to their needs and desires. As early as 1874, long before the general acceptance of the participation of women in politics, the Grange had endorsed the principle and had given women equal rights in the order.

In spite of the fact that the social and intellectual objectives of the founders of the Grange were overshadowed during the seventies by the economic and political issues, important results were achieved in the former fields; the meetings, picnics and festivals of the local granges helped to relieve the social and intellectual drabness and isolation of rural life. After the debacle of the late seventies emphasis was shifted to these features; and the order flourished most vigorously in the east, where it had not been involved in politics and business ventures. The membership, which was 858,050 in 1875, fell to 124,420 in 1880 and remained at about that figure for the next ten years. Then began a slow and fairly steady advance, until in 1927 the membership rose to approximately 600,000 concentrated largely in New England and the north central states, Ohio, Michigan, Kansas, and the Pacific northwest. The promotion of agricultural research through the state experiment stations and of education in the technique of agriculture and in home economics had received much aid in its initial stages from the Grange and remains one of its major interests. The organization, however, still brings its influence to bear on state and national issues. It maintains headquarters in Washington and endeavors alone or in cooperation with the National Board of Farm Organizations to obtain legislation believed to be advantageous to farmers. It is now, however, one of the more conservative of the farmers' organizations.

GRANOVSKY, TIMOFEY NIKOLAEVICH (1813-55), Russian historian. After graduating from the University of St. Petersburg at the age of twenty-two Granovsky spent over two years abroad, mostly in Berlin, in preparation for an academic career. Upon his return in 1839 he was appointed to the chair of general history at the University of Moscow, which he held until his death. Granovsky's lectures soon earned him an unfailing popularity among the students and attracted general public notice. Distinguished for their literary excellence, these lectures presented the first instance of Russian university teaching raised to the level of western scholarship and were in no small measure responsible for the reputation enjoyed by the University of Moscow in the forties and fifties.

The principal strains in Granovsky's historical outlook were Hegelianism and Savigny's conception of organic development; these were tempered by the influence of Guizot and Thierry, which guarded him against the extreme conservatism of the right Hegelians, and modified by the teachings of Ritter, which led him to emphasize toward the end of his life the historical importance of the material, particularly the geographical, environment. In his interpretation of the historical process he emphasized the importance of the intellect and of the untrammelled personality, thus indirectly opposing humanist and liberal ideas to the ideology of repressive absolutism of contemporary Russia. This interpretation is intimately related to his views on Russian history and civilization; in that field he was prominently identified with moderate westernism.

GRANTS-IN-AID. A grant-in-aid is a sum of money assigned by a superior to an inferior governmental authority either out of the exchequer of the former or out of sources of revenue specifically designated. The term is English in origin; in that country grants are given to overcome the poverty of local authorities, to make possible a fairly high minimum standard of efficiency over the whole country and to provide a sanction for the exercise of regulatory and inspec-torial power by the central authority. The anal-ogous device has a different name in other coun-tries and may be adapted to somewhat different purposes because of a different relation between the center and the localities.

The English system of grants-in-aid is only in its later stages the result of conscious attention to the problem of a good workable relationship between central and local authorities. Before 1835 not a pound was paid to local bodies. Grants began merely as an attempt to relieve the agricultural classes of the burdens of local taxa-tion, which was based upon the value of real property only. This property was mainly agri-cultural and the multiplication of grants-in-aid was partly an answer to the constant demand of the farmers, voiced through the Conservative party, for rate relief. A further impetus to the use of grants came from expenditures for those governmental services—education, police, pub-lic health, roads, poor relief and housing—which, while not obviously central like the army, the navy or the currency, nevertheless concern the state as a whole because the social causes and benefits of the expenditure are wider than any local area. Complete centralization of such ser-vices, however, implies a ubiquitous central bu-reaucracy and parliamentary control, which are unadaptable to local circumstances. What was needed was local executive discretion with cen-tral regulation through a grant-in-aid sufficient for the local authority's contribution to the com-mon welfare yet not enough to relieve the local authority of the anxiety of paying for extrava-gance out of its own rate fund. Such considera-tions first arose in 1846 under Sir Robert Peel, the first administrator statesman to understand the significance of grants-in-aid.

The first grants were given directly to the lo-cal authorities concerned, who thus felt their due dependence upon the central supervising departments. In 1888 the Goschen reforms, em-bodied in the Local Government Act, provided assignment to the county and county borough councils of specific revenues which should ex-

pand with their needs and payment to the smaller local authorities indirectly through these councils. The influence of the central depart-ments was thus considerably reduced; further-more, no revenues were discovered whose ex-pansion was exactly proportionate to that of local needs. For these reasons the Goschen sys-tem was gradually abandoned and subsequent grants, such as those for education, were given out of the national Exchequer directly to the authorities concerned; its final and complete abolition came with the Local Government Act of 1929.

Grants may be allocated to a specific use or they may be "block" grants in aid of a general purpose, e.g. health or police, but without spec-ific allocation to detailed items. The allocated grant permits the more enlightened central au-thority to encourage local provision of services which it deems necessary. It requires, however, a central staff to supervise and audit expendi-tures and it raises many problems of classifica-tion. The block grant eases the work of the cen-tral authority and permits local adaptation by and a sense of freedom in the local authorities. In general the English system is now mainly the block grant. The earliest and easiest type of block grant was a sum of money bearing no par-ticular relation to local government needs. Then came the method of granting a percentage of local expenditure for a particular purpose, such as one half the salaries of teachers in poor law schools or one half the cost of police. By 1929 most English grants were percentage grants. They gave least to the poorest localities, which needed most. The grants were exceedingly un-discriminating and made no allowance for the extreme variations in ratable value as between different sections. Towns in southern England, for example, have a ratable value per head over three times that of towns in some industrial areas. The percentage system furthermore lets the local authorities set the pace of central ex-penditures and so tends to make them reckless.

The education grants were the first to aban-don the percentage system and to apply to block grants a formula based on the need for the serv-ice weighted by the relative poverty of the area. The former was estimated with reference to the number of children attending school, the cost of administration and the cost of teachers' salaries; the latter with reference to the lowness of the ratable value per head. The Local Government Act of 1929 established a somewhat similar sys-tem for all grants other than education, police

and the principal highways. The basis of the formula is population, weighted by the proportion to population of children under the age of 5; the extent to which the ratable value is less than £10 per head; unemployment where the ratio of unemployed to total population is over 1.5 percent; and density of population per mile of public road (the less the density the larger the grant). This formula gives the index of distribution between counties and county boroughs. The counties themselves receive one half the amount indicated by the formula; the rest is divided among the municipal boroughs and urban districts according to the proportion their population bears to the whole population of the county and among the rural districts on the basis of one fifth of the proportion of their population. The present total amount divisible among the local authorities on this basis is about £45,000,000, which constitutes the General Exchequer Contribution fund. Police grants are still 50 percent of the annual expenditure of the local police authorities.

The Goschen system of assigning specific revenues to the counties and county boroughs gave stability to both local and central finances but made no allowance for recalculation to provide for changes. Under the act of 1929 all grants save education and police are to be recalculated after three, seven, twelve and seventeen years. Grants for education and police are annually recalculable. The act of 1929 provides for a reexamination of the entire problem of grants after seven years. Since 1929 inefficiency in any one branch of service may entail stoppage of the entire grant-in-aid (except for police and education); formerly it was withdrawable from each specific service for inefficiency in that service only.

The total annual amount of grants is about £80,000,000, which is equivalent to about 25 percent of the total local expenditures. This represents an increase from £5,000,000 in 1880, £16,000,000 in 1900 and £65,000,000 in 1920-21. Most of the growth came after 1874, with a very marked acceleration after 1900.

In France the departments and the communes may add to the taxes of the central government certain *centimes additionnels* which they may collect for their own use. The amount and purpose of such additions is limited by general act of parliament; the fact that they may be levied because of the insufficiency of the local revenue for the services required of the local governments by the central government, for police, roads and poor relief or for general expenditures, gives

them a certain functional relation to grants-in-aid. In addition to this important source of revenue the departments and communes share in certain *fonds communs* set aside by the central government out of the receipts from certain taxes. The system of *fonds communs* may be said to date from 1890, but it acquired vastly increased importance after the World War with the establishment in 1918 of a fund from a portion of the taxes on alcoholic liquors and in 1920 of a fund receiving 10 percent of the general sales tax. The former is divided among the communes alone on the basis of population and of consumption of alcoholic liquors in 1913; the latter in general according to population, one third going to the departments and two thirds to the communes. In 1925 the communal receipts from these two funds was 708,000,000 francs; in the same year the departments received from the sales tax fund 98,000,000 francs. *Subventions* corresponding more strictly to the English grants-in-aid are given to the departments by the central government on conditions of efficiency and central sanction of schemes; the communes are subsidized by both central government and departments under definite conditions for such services as roads, health, care of children, fire brigades, water supply, education, agricultural experiment stations, regular motor and tramway service and electrification. The amount of these grants is much smaller than in England.

In Germany grants from individual states to their own local authorities are used in ways similar to those found in a unitary state like England. Thus, in Prussia until 1919 the central authority gave two kinds of grants-in-aid, *Subventionen* and *Dotationen*. The former was a variable sum paid for specific purposes to secure administrative control, such as payments to school authorities in aid of the pay of school teachers in order to raise the standard of training and recruitment. The main grants were given on the *Dotation* principle; that is, the higher local authorities, the *Provinzen*, received one half of their total expenditure from the state because they were carrying out state duties and supervising the smaller authorities. The *Provinzen* in turn distributed grants to local units on various bases such as need (poverty), area and population. The *Dotationsgesetz* of 1902 established a formula for distribution which combined ratable value, expenditure per head and population. Roads, poor relief, the care of the blind and the mentally deficient, agriculture and midwifery were subsidized. Since the revolution Prussia

has continued to divide a portion of the revenue it receives from the Reich among the different classes of local authorities on the basis of such factors as income before the war, work to be done, population, area, length of roads and number of school children. Other German states follow similar systems. Grants are not generally allocated in detail, and they are less an instrument of central control than in England.

In addition to these financial arrangements between the states and local governmental units the German Reich has since 1879 assigned some of its income for distribution among the individual states. In 1902 the Reich gave direct subventions to certain needy states; East Prussia was similarly aided during the World War. The Weimar constitution gave the Reich paramount control over revenue, but a percentage of certain revenues which it collects is automatically assigned to the individual states. The terms of the arrangement are set by the Financial Settlement Law (*Finanzausgleichsgesetz*) of 1923 and its amendments. While these assignments (*Überweisungen*) may be included under a broad definition of grants-in-aid and while they may have important consequences for the relative political strength of the two governmental authorities, they have not the same importance for immediate control of expenditures as the grant-in-aid more narrowly interpreted. A grant of about 190,000,000 marks per year is made to the states for police; distribution is on the basis of the expenditures of the states for that purpose. The Reich may also aid with a subvention (*Zuschuss*) or take over such state undertakings as are too large for a single state or extend in influence beyond the borders of the local authority; grants of this type are rare. A function similar to that of the grant-in-aid is performed by the small but significant subsidies paid to quasi-public bodies at the discretion of department heads out of certain funds voted to their departments without specific allocation.

In Switzerland since 1874 a strong central tendency has prevailed, but a fairly large field of central authority is offset by a primordial and lasting notion of local sovereignty. This is evidenced by the vesting of administrative power in the cantons, even in matters of central legislation, and by what is partly a result of this, the restriction of federal financial competence. The federal authority has in the main the field of indirect taxation; the cantons, that of direct taxation. But as the federation raises new taxes, the cantons claim a share. There is therefore an in-

cessant financial assignment of revenue to the cantons, through *Überweisungen* and *Subventionen*. The former are given without specifying the object of expenditure, sometimes according to population, sometimes according to a fixed figure determined by the amount of revenue lost in a given year. In the case of subventions the objects of expenditure (roads, canals, forestry and agriculture, health, land registry, education and social welfare) are prescribed and federal supervision is strict. The results upon social development have been important and beneficial. The importance of federal subventions for cantonal economy has declined. In 1922 they represented almost 17 percent of cantonal expenditures; in 1924, slightly more than 9 percent.

In the American federal system state and central authorities have extensive independent sources of revenue. Neither this fact nor the constitutional limitations upon the powers of the federal government have prevented the development of a system of federal aid to the states under which the federal government is able to control many types of governmental activity which otherwise would be beyond its authority. The earliest federal grants to the states—land from the public domain and \$20,000,000 distributed from the federal Treasury in 1837—were made with practically no supervision or conditions as to expenditure. But the poverty and cultural backwardness of some states and the desire of the central government to secure more uniform progress in certain fields of state activity forced the development of a system of federal aid prescribing minimum conditions for the grant of assistance. The development of the present technique of federal control of money grants dates essentially from the passage of the Weeks Act in 1911. The act appropriated \$200,000 to be distributed among the states to aid in the fighting and prevention of forest fires. The conditions of the grant were that the state should appropriate a sum as large as the federal grant made to it and that the plans for the expenditure of both federal and state money were to be drawn up by the state officials, but that they were to be approved by the United States Department of Agriculture. These requirements of equal state contributions and federal supervision of state drawn plans have become the corner stones of the federal system of grants. They give the federal government control not only of twice its own grants but of much more, since plant and equipment, for which no federal grants are ever made, must nevertheless meet

federal minimum requirements. Despite the importance of the grants as a means of increasing federal control every state has with few exceptions accepted every subsidy offer of the federal government. The principal directions of federal aid are the prevention of forest fires, the development of agriculture and roads, the maintenance of the national guard, the promotion of vocational education, the rehabilitation of disabled persons and the promotion of child and maternity welfare. The total grants from the federal Treasury (exclusive of the value of land grants) were about \$8,000,000 in 1912; they were over \$135,000,000 in 1930. Of this last amount 56 percent was in aid of the great arterial roads and 24 percent for the National Guard. The prevailing principle of distribution of grants is on the basis of population. In the case of the highways two other factors are also considered, while the distribution of the grants for forest fire prevention, discretionary with the secretary of agriculture, has been on the basis of need measured by the cost of protection.

Local governmental units in the United States have been aided in various ways and for various purposes by the state governments. Taxes are assigned by the state to the local authorities for urgent services of more than local importance, a method which keeps state supervision at a minimum. Various proportions of state taxes are returned to the local authorities earmarked for special purposes, for example, roads, education, poor relief and police. The amounts given are sometimes made to depend on the units concerned, e.g. school children, teachers or miles of road. Grants-in-aid proper are given by the states to counties and municipalities, while in some cases counties make grants to municipalities within their boundaries. Grants from the states averaged between 7 and 8 percent of total local revenue in 1925, but there was a wide range from less than 1 percent in Kansas to over 27 percent in Wyoming. Almost three fourths of these grants were for education and slightly less than one fifth for roads. Education grants predominate to an even greater extent in grants to municipalities. Between 4 and 5 percent of all municipal revenue comes from state and county grants. While the states have attempted to set standards for the use of the grants and even in some cases for the use of earmarked taxes, they have on the whole not succeeded as well as the national government in raising administrative standards by this device.

While the grant-in-aid has succeeded in

achieving considerably heightened efficiency in governmental administration it has everywhere encountered serious opposition from advocates of local self-government. This opposition has in general cut across party lines. The local authorities have desired the grant without control, the central authority control without a grant. The history of grants-in-aid indicates that local authorities have allowed themselves to be bought and that central authorities have acquired by the grant-in-aid the power to encourage local authorities to develop and maintain standards which would undoubtedly not have been attained without external stimulus. The grant is a supple instrument at once effective and inoffensive. Yet it is only a sanction. Whether central control shall be effective or not depends more upon the central regulations, the prestige, number and quality of its inspectors than upon the amount of the grant.

GRASLIN, JEAN JOSEPH LOUIS (1727-90), French economist. Graslin was one of the leading opponents of the physiocrats. In his *Essai analytique sur la richesse et sur l'impôt* (London? 1767; ed. by Auguste Dubois, Paris 1911) he rejected the physiocratic principle that agriculture alone is truly productive and asserted that labor, regardless of whether applied to agriculture, commerce or industry, is the only source

of wealth. This recognition led him to the rejection of the second major physiocratic principle, that of a single tax on agriculture. With the mercantilists he stressed the importance of immaterial goods or services and justified taxes as payment by citizens for state protection. He also saw in the tax an instrument to be used for the purpose of balancing the income shares of the economic groups and preventing the recurrence of economic crises. Graslin emphasized the subjective element in the formation of value but failed to distinguish clearly between value and wealth. He struck an original note in attempting to give a sociological interpretation of value. Two different concepts of wealth and value underlie the two main social classes, the *possesseurs* and the *consommateurs*. The former, interested primarily in the possession of wealth already produced and appropriated, are likely to stress scarcity as the dominant element in value formation; while the latter, intent upon the task of securing commodities, approach the process of valuation from the standpoint of *abundance* as reflected in the degree of accessibility to resources and conditions of production.

Graslin occupies a unique position in the history of economic thought. His views on protection and monopolies led some to classify him as a mercantilist. The social note which pervades his writings—as exemplified in his demand that those who cultivate the soil should own it—brought him within the orbit of socialism. In his view of labor as the source of wealth and in his emphasis on value as the central point of economic discussion he anticipated the era of classical economics.

GRATIAN, Italian canonist of the twelfth century. Gratian was a Camaldolensian monk. He was born perhaps at Chiusi and taught at the monastery of Saints Felix and Nabor in Bologna. About 1140 he composed his *Concordia discordantium canonum*, which soon became known simply as the *Decretum*. It assembled close to 3500 texts—canons of the councils, decretals, Roman laws, extracts from the church fathers and the like—bringing together the materials from the existing collections which circulated in

the west after the Gregorian reform, such as those of Anselm of Lucca, Yves of Chartres and Alger of Liège. The *Decretum* is divided into three parts; the first consists of 101 *distinctiones*, relating to the sources of the canon law, and ordination; the second part, consisting of thirty-six *causae*, treats in the form of hypothetical cases questions of procedure, ecclesiastical perquisites, persons in orders, matrimony, penitence; the third part, entitled *De consecratione*, consists of five *distinctiones* relating to church ritual and the sacraments. Upon every point Gratian grouped the divergences of the authorities and in his *dicta*, or comments, attempted to reconcile them by virtue of a method which was historical as well as logical.

Gratian's work never had more than a private character, but the popes and ecclesiastical courts have treated it as of the greatest authority and since the twelfth century it has formed the basis of instruction in the canon law. It has formed moreover the first part of the *Corpus juris canonici*, and the *Codex* which replaced the *Corpus* in 1917 borrowed from it many of its rules. It may thus be considered the sum of the ancient canon law as well as one of the principal sources of the living law.

Theology and morals still hold a great place in the *Decretum*, but little attention is paid to pure speculation. Gratian had the great merit to apply a juridical method to the texts which contained the actual disciplinary rules; and he thus contributed to the creation of an autonomous science of canon law, which in the future was taught in accordance with the *Decretum* side by side with theology. As a result the *Decretum* has had a great influence upon political and social doctrine and has provided some of the foundations for the contemporary Christian society. Its theory and practise of religious organization and many of its views of the state, the relation between church and state, the theory of war, the rights of property and contract and the law of civil and of criminal procedure were based in large part on the texts of the *Decretum*.

GRATTAN, HENRY (1746-1820), Irish statesman and orator. Grattan came of a refined Dublin family, son of the recorder, went to Trinity

and was admitted to the bar. In London he studied Chatham's oratory, entered the Irish Parliament in 1775 and soon rose to leadership of the Patriot party. The ideas of parliamentary self-assertion that had been planted by Molyneux and Swift were rapidly ripening through events in America. Grattan's eloquence found a ringing response even in a lower House controlled by borough owners, while the armed strength of the Volunteers—a Protestant force organized against possible French invasion—excited and reenforced his demands. His first victory was the free trade legislation of 1779. As the American war progressed, analogous aspirations pulsed in Ireland. The Volunteers rose from 4000 to 80,000, and eventually to over 100,000. The surrender of Yorktown and the downfall of North in 1782 brought a crisis in which Grattan struck with decision. The crown yielded. "Grattan's Parliament," free from English supervision and review, was hailed with extraordinary enthusiasm, and £100,000 voted to Grattan, of which he consented to take £50,000. But while Ireland thus entered into dual monarchy on apparently equal terms, the borough owners still remained in control of the lower House, the English interest controlled the borough owners, the English cabinet appointed the Irish executive officers and three fourths of the people, as Catholics, were denied representation. Grattan desired reform but his reluctance to uphold the Volunteers in their attempt to force the hand of Parliament to reform itself left him dependent on eloquence. He was able to increase commerce and help agriculture by paternal legislation and in 1793 the franchise was extended to Catholics. But in 1795 he came into conflict with Pitt on full Catholic emancipation, the English interest dominated the Irish Parliament, and Grattan could make no further headway. The French Revolution had meanwhile brought Wolfe Tone and the United Irishmen into activity. Grattan so strongly dissociated himself from the United Irishmen on the one hand and the united placemen on the other that he retired broken before the rebellion of 1798, although at the last minute in 1800, on the eve of the corrupt vote that extinguished his Parliament and enacted legislative union, he flamed out in patriotic eloquence. At Westminster, where he held a seat from 1805 until his death, he vindicated his fame as the "Irish Demosthenes" and continued unrelentingly to advocate the full political and social equality of the Catholics, though he parted with O'Connell on the refusal of the Irish to give to the Eng-

lish crown a voice in the nomination of Irish bishops.

Grattan's importance, and his limitations, came from the ardor with which he strove to combine legislative independence for Ireland with loyalty to the empire during the American and French revolutions. A Whig in his ideals, a believer in the landed gentry, an aristocrat and hater of the mob, he still demanded "whether Ireland shall be an English settlement or an Irish nation," and although born into the Protestant ascendancy he held, in advance of most of his class, that "the Irish Protestant will never be really free until the Irish Catholic ceases to be a slave." Grattan was not a profound political thinker or an unfailingly astute diplomatist, and he never fully appreciated the dynamics of the revolutions of the eighteenth century. But he was pellucidly honorable. His idealism and his courage enabled him to play an indispensable part in the formation of the Irish nation.

GRAUMANN, JOHANN PHILIPP (1690 or 1706-62), German currency theorist and administrator. Graumann was one of those eighteenth century adventurers who wandered from court to court with schemes for enriching both the princes and themselves. He was fully convinced that the state could control economic activity by establishing a reliable currency. According to his theory the absolutist state should mint coin with the ordinary manufacturer's purpose of extracting a profit, the seigniorage. To augment the seigniorage it should create a steady demand for its coins abroad and thus raise the ratio in which they exchanged against bullion. In 1750 Frederick the Great summoned him to direct the Prussian mint; Graumann accepted, promising that he would make Prussian money supplant the Dutch ducat as the commercial currency of northern and eastern Europe—an achievement which would raise the seigniorage to its peak. At this time the increased supply of gold during the first half of the century and the consequent decline in its value had seriously impaired Frederick's silver standard, but he refused to abandon it. In 1747 as master of the

mint in the duchy of Brunswick Graumann had already foreshadowed his solution for this difficulty by coining lighter silver pieces than those commonly in use in German territories since 1566. He now introduced into Prussia his standard of mint—fourteen thaler to the mark of fine silver—and established a fixed par for gold by coining the new *Reichstaler*. But the facts soon demonstrated that the mere export of coin without the export of goods was inadequate to control the rate of exchange and the price of silver. Graumann's standard had to be abandoned and he was dismissed. In 1764, however, the fourteen-thaler standard was restored, although Graumann's theories were not revived with it. Since at about the same time the south German states adopted the uniform *Konventionsmünze* as the rival of the northern *Reichstaler*, Graumann may be credited with substituting for the motley coinage of the Holy Roman Empire two standard systems which prevailed over wide areas and lasted for over a century.

GRAUNT, JOHN (1620-74), English statistician. Graunt was the son of a London draper and was apprenticed to a haberdasher. He later followed this trade and soon achieved wealth, political success and social standing. In 1662 he published *Natural and Political Observations . . . Made upon the Bills of Mortality* (London), which secured his election to the Royal Society and assured him fame as the father of modern vital statistics. Within a brief period five editions made their appearance and a German translation appeared in Leipsic in 1702.

From the confused and long neglected contents of the bills of mortality for the city of London and adjoining parishes, first compiled in 1532, Graunt derived four basic demographic principles: certain vital phenomena are regular; the urban death rate normally exceeds the rural death rate; mortality rates are highest in the early and the late years of life; male exceed female births, but females constitute approximately one half of the population. He constructed the first

London life table; classified deaths and death rates by cause; noted seasonal and annual variations in death rates; suggested that "populousness" may influence the death rate, that fertility is influenced by sex and age composition, the health of the population and other social and physiological factors and that rural natural increase contributes to urban growth; observed that male mortality exceeds female mortality; considered population as an index of national wealth; and stressed the need for a complete census. He viewed some occupations as "unproductive" and differentiated between the "intrinsic" and the exchange value of land. With one minor exception Graunt's *Observations* were remarkably free from theological interpretation. His work greatly influenced Petty, William Derham, Halley and Süßmilch.

GRAVINA, GIANVINCENZO (1664-1718), Italian jurist and man of letters. Gravina was one of the founders of the Academy of Arcadians and the author of a number of tragedies and of a famous book on aesthetics, *Della ragion poetica* (Rome 1708). His principal juridical works, *Originum iuris civilis* (3 vols., Naples 1701-08) and *De romano imperio* (Naples 1713), were written after he had begun the teaching of law in the college of the Sapienza in Rome in 1699. In opposition to Grotius, who deduced natural law only from the principles inherent in man, Gravina maintained that these principles in turn derive objective value only from divine reason, which has given man his own law of reason superior to the law of physical desires common to all creatures. Reason guarantees justice and liberty for the individual as well as for society. The latter founded on agreement and cooperation between men tends toward the social good, uniting individual with general welfare and the will of all with the general will. Laws restrain the irrational will but embrace and conserve in themselves the rights and powers of each individual; he who obeys them is governed not by an external force but by his own share in sovereignty. The existence of the irrational will makes

it necessary that public power should protect the common good and the sacred liberty of all. In these ideas Gravina is a precursor of Rousseau as of the historical school of law in the assertion that law can be understood only from its history. The latter canon he applied in his study of Roman law. He justified the Roman Empire as a government of reason; but he recognized no right of war unless founded on the necessities of peace, which he considered the essential principle of *jus gentium*. Gravina's views exerted considerable influence outside his own country, particularly upon Montesquieu. His works went through various editions in Italy and Germany, and a French summary of the *Originum* was prepared by J. B. Requier in 1766.

GRAY, JOHN (1799-1850?), British radical reformer. In the critical years following the Napoleonic wars Gray was stimulated by the anti-capitalist ideas of Ravenstone, Sismondi and others. His first publication, *A Lecture on Human Happiness* (London 1825, reprinted 1931), was a vigorous broadside in which he endeavored to prove on the basis of Colquhoun's figures as given in *Treatise on the . . . Resources of the British Empire* (London 1814) that labor is robbed of four fifths of its produce and that the unequal exchanges in favor of capital, aggravated by severe and universal competition, cannot but result in a restriction of effective demand, which in its turn limits and dislocates production. Inclined at first to seek a solution in communistic organization, he finally ranged himself with those reformers who believed that the source of social misery lay not in private control of production but in the competitive individualistic mode of marketing and the assumption of intrinsic value of gold or any other medium of exchange. In his *Social System* (Edinburgh 1831) he therefore advocated a nationalization of marketing by which all goods would be delivered to national warehouses by the producers, who in return for paper

money issued by a national bank to accredited agents would receive other goods at a price fixed by chambers of commerce. In Gray's scheme, as in labor exchanges proposed later by Owen, Bray and Proudhon, exchanges would always be equal, labor would get its reward and, since the amount of money would always be in proportion to the goods, their circulation would not encounter any obstacles on the side of currency.

GRAY, JOHN CHIPMAN (1839-1915), American jurist. Gray, lawyer, teacher and writer, is preeminent as a connecting link between present day ways of thinking and teaching and the older ways that derived from Blackstone, Austin and Story. He began to teach in the Harvard Law School in 1869. One year later Langdell came to inaugurate his new system; Gray, perceiving its merits, adopted it before its wider public acceptance. Already well established in practise, Gray's undertaking to deliver lectures for law students was in accord with the tradition that law teaching should be an incident of professional life; but in Gray's case it became his major activity. For his students he published a collection of *Select Cases . . . on the Law of Property* (6 vols., Cambridge, Mass. 1888-92; 2nd ed. 1905-08), which substantially fixed the scope and content of instruction in the field. His zest in teaching the law of property also resulted in his greatest work, *The Rule against Perpetuities* (Boston 1886, 3rd ed. 1915), a treatise often cited by English as well as American courts. A smaller and earlier treatise, *Restraints on the Alienation of Property* (Boston 1883, 2nd ed. 1895), had been published in opposition to the federal Supreme Court's decision [*Nichols v. Eaton*, 91 U. S. 716 (1876)] recognizing the validity of spendthrift trusts, which Gray denounced as contrary not only to legal precedents but moral principles.

Gray's eager and curious mind brought him to an early interest in the philosophy of law and in his seventieth year he published *The Nature and Sources of Law* (New York 1909, 2nd ed. 1921), a work which exhibits his characteristic virtues, sound learning, crisp style and subtly whimsical humor, but does not rival his achievements in property law. Gray was too much the man of

affairs and above all too much the Puritan moralist to be happy or even comfortable with the legal philosophers. To him much of the refined speculation of the Germans was but "barren scholasticism." His analysis of legal relationships was often lacking in precision; and while he vindicated triumphantly his conviction that judges make the law, yet his Puritan zeal for righteousness led him to assume the independent existence of moral principles that guide the judge in his lawmaking, just as it had caused him to condemn spendthrift trusts for their dishonesty.

GREAT POWERS. The great power concept is essentially a modern one. The hegemonies of ancient empire builders and the *pax romana*, the unities of the Holy Roman Empire and the papacy, left no room for other and independent sovereignties. The modern idea of the state, of which Bodin was the earliest exponent, was the indispensable basis of the great power system. Toynbee has defined a great power as "a political force exerting an effect co-extensive with the widest range of the society in which it operates." With the expansion of international society modern great powers are in consequence world powers.

The factors which at different periods have determined the status of the great powers indicate the continuing significance of physical power. Perhaps the earliest determinant was man power. Additions to man power were secured by conquest or alliance. Territorial accretions were originally chiefly valuable as potential recruiting grounds. Later, prestige and trade values became important; these were obtainable more advantageously through alliances, first of the reigning houses by marriage—a policy not altogether without significance today—and more recently of the governments by treaty.

A second factor of importance has been the character of the ruling classes together with the stability of the political system. States relatively inferior in man power and other apparent prerequisites for first rank have under rulers of outstanding ability achieved at least temporary recognition as great powers. Such was the position of Sweden under Gustavus Adolphus and again under Charles XII. The unification of Germany and of Italy under capable leaders and

with an efficient governmental organization insured their recognition as great powers. The effect upon a great power of the absence of capable leadership is illustrated by the history of Spain.

A third influence, of increasing importance since the industrial revolution, is the possession of adequate or surplus supplies of natural resources and power reserves. The concentration of available supplies in relatively few districts and the necessary prerequisite of a developed industrial technique to utilize them insured the primacy of those powers in which the integration of resources and technique was farthest advanced, thus further increasing the inferiority of the smaller powers. Closely allied to this factor of industrial supremacy are two others—geography and climate. The former is important chiefly in terms of communications and strategic defensibility. The influence of the latter upon the character and activities of peoples has been analyzed by Ellsworth Huntington in *Civilization and Climate* (3rd ed. New Haven 1924) and *World-Power and Evolution* (New Haven 1919).

All these factors may perhaps be epitomized in the race for colonies which has marked the expansion of Europe during the last four centuries. Originally prized for the gold or tribute they yielded directly to the mother country, the colonies soon became important sources of raw materials and no less important markets for expanding home industry. In more recent times, while these advantages have increased, others have become apparent; colonies have acquired a new significance as profitable fields for the investment of surplus capital, as areas for exploitation by surplus population and as potential reservoirs of man power; for example, in the case of the French B mandates in Africa. Colonies alone do not, however, bring great power rank, as is evidenced by the absence of Holland, one of the leading colonial powers, from the present list of great powers.

For four centuries, as a result of comparative advantages—military and political, territorial and economic—a group of great powers has dominated international diplomacy. But the membership of the group has changed with the shifting fortunes of the individual nations. By the end of the Napoleonic wars Turkey, Spain, Portugal, Holland and Sweden had at one time or another won and lost the rank of great power. At the Congress of Vienna, five great powers—France, Great Britain, Austria, Russia and Prussia—were recognized; by 1914 the group had

increased to eight, of which two, the United States and Japan, were non-European. The World War resulted in the dissolution of one, Austria-Hungary, and in the temporary exclusion from the great power group of two others; one of which, Germany, has already been officially readmitted, and the other, Russia, tacitly. In 1926, when Germany was admitted to the League of Nations, three states, Brazil, Poland and Spain, put forward claims to permanent seats on the Council as evidence of equality with the great powers. Despite strong political support, however, their claims were not accepted. The two countries with the largest populations, China and India, are not great powers because other prerequisites to such rank are lacking.

This changing group of great powers has increasingly controlled international diplomacy and adjusted international relations, primarily in terms of advantage to the powers themselves. At the Congress of Vienna the four victorious great powers dictated the terms of peace alike to weaker allied nations and neutrals and to the vanquished. The Treaty of Versailles was presented to the Allied and Associated Powers by the five principal allied powers, and most of its provisions were drawn in secret conference of the representatives only of Great Britain, France, Italy and the United States. In the distribution of spheres of influence in the late nineteenth and the early twentieth century the great powers alone shared, as they did in the main in the distribution of mandates after the World War. The mandates system in a measure carried out the implications of another feature of the great power privileges—that certain areas were recognized as the "special interest" of particular great powers, which had to be consulted in the settlement of any questions concerning those areas. The Monroe Doctrine asserted such a claim; more recent examples are the Japanese rights in Manchuria, the American paramountcy in the Caribbean and the British interests in the area of the Suez Canal.

The balance of power (*q.v.*), more or less haphazardly maintained by a varying system of alliances until the Congress of Vienna, was regularized during the nineteenth century by what came to be known as the Concert of Powers (*q.v.*). The great power group settled the destinies of the rest of the world by a series of conferences and congresses at which attempts were made to forecast and lessen the tension of impending crises or to liquidate their effects. The pre-war administrative unions represented the

sum of positive cooperative activity among the powers, while the two Hague conferences were perhaps tentative forerunners of what might ultimately have become a more or less periodic international legislative assembly. But for the most part the ends sought by the concert were negative—the prevention of war or its settlement. Nor did the concert develop procedures adequate even for this task; the very absence of available consultative machinery retarded if it did not prevent its evolution toward a more stable international system.

The methods by which the great powers have exercised their control have been modified by changing legal theory and actual international organization. Even while force was the accepted mode for the settlement of international disputes and right therefore seemed synonymous with might, the concept of the equality of states, persuasively championed by Grotius and his successors, became the accepted legal basis of international society. Such a theory if it was to be honored in practise required that it be treated as a formality in some situations and as inapplicable in others. Thus in international conferences, while the fiction of equality is maintained, it is evaded in fact by various devices—by the allocation of committee chairmanships to the great powers, by the admission of colonies as separate voting units under their control and by the relative overweighting of countries and colonies through the device of graduated contributions and voting power. The United States employs the latter two methods in the International Institute of Agriculture, in which it has placed the Philippine Islands, Hawaii, Porto Rico and the Virgin Islands in Class II as of equal rank with such an important agricultural country, for example, as Canada. In some cases the great powers simply omit to include interested small powers at certain conferences. Thus Holland, although the second Pacific colonial power, was not invited to sign or adhere to the Four-Power Pacific Treaty of December 13, 1921.

The World War fundamentally modified the status of the great powers. The existence and activities of the League of Nations have affected the pre-war diplomatic system both explicitly and implicitly. Formally, the structure of the League itself indicates the changing position of the great powers. On the Council the original majority of states permanently represented was converted into a minority within two years, and in 1926 the small power majority was still fur-

ther increased to nine of the fourteen seats. Again, by article 393 of the Treaty of Versailles eight of the twelve government representatives on the Governing Body of the International Labor Organization represent permanently the eight states of chief industrial importance; the amendment proposed in 1922 to increase the size of the Governing Body to sixteen left the "government" representatives of these powers at eight. In the Assembly of the League moreover the rule of unanimity is subject to several minor but prophetic exceptions.

But the implicit changes are perhaps even more significant. For the first time the small powers are finding themselves in a position to play an influential if not a decisive role in major diplomatic negotiations. Through cooperation among themselves, in such formal and informal arrangements as the Little Entente, the Baltic Conference, the Balkan Confederation, the Latin American bloc (especially *vis-à-vis* the League), they have succeeded within and without the penumbra of League activities in exerting a far greater influence than in pre-war negotiations. In the Council and Assembly of the League moreover some of the outstanding leaders have been representatives of the smaller states, whose influence on the formulation and execution of League policy has not only far outweighed the diplomatic prestige of their countries but has often enhanced it. Thus the democratic nature of League machinery, its positive cooperative functions and continuous contact between individual leaders from different countries, which it facilitates, without repudiating the pre-war great power system, is molding the organization of world politics into forms through which the smaller powers share more than ever before in ultimate decisions of policy. Finally, the post-war network of arbitration and conciliation treaties, most highly developed in the Optional Clause of the Permanent Court of International Justice and the General Act of 1928, has linked the majority of the great powers with most of their neighbors by pledges of pacific settlement of all disputes. Earlier opportunism and disregard of the interests of smaller powers, justified by the ancient rubrics of national honor and vital interests, are thereby becoming inconsistent with contemporary canons of international conduct—and with binding treaty stipulations.

Nevertheless, the practical functioning of the League machinery in any important crisis still depends primarily upon the attitude taken by

the individual great powers. This was particularly evident in the League attempts to cope with the Sino-Japanese conflict in Manchuria in 1931 and the ensuing Shanghai difficulties in 1932. While this situation may be partly a result of the fact that two great powers are not members of the League, it is nevertheless true that the maintenance of world peace and the settlement of international difficulties still depend primarily upon the great powers.

GREELEY, HORACE (1811-72), American journalist and political leader. After a varied experience as printer, editor and publisher, mainly of Whig journals, Greeley saw the opportunity in New York City for a low priced Whig daily to stand midway in character between Bennett's sensational *Herald* and Bryant's scholarly *Evening Post*. Accordingly on April 10, 1841, he founded the *New York Tribune*, which was an almost instantaneous success and which by 1846 possessed the best newspaper staff in the country. In Greeley's thirty-one years as editor of the *Tribune* he impressed his doctrines, tastes and personality upon the northern reading public as no other editor has ever done, and in many communities his paper became a "political Bible." For the first dozen years he remained a loyal Whig, although he wished the *Tribune* to be "removed alike from servile partisanship on the one hand, and from gagged, mincing neutrality on the other." His working class contacts and his reading of the English Chartists, of William Leggett and of Robert Dale Owen led him to form a set of decided and radical views on social questions. He fervently detested all forms of monopoly and landlordism; he insistently struggled against the growth of class dominance, the unequal distribution of wealth and the aggressive, heedless industrialism of the day. Influenced by Albert Brisbane, he thought for a time that Fourierism offered the best remedy for current maladies, and he supported the formation of phalanxes. He was keenly interested in promoting agriculture and westward emigration as

safeguards against capitalist tyranny; serving briefly in Congress in 1848-49 he introduced a homestead bill, while he led the attack on railway land grants. Old style classical education provoked his scorn, but he gave unflagging support to new educational ideas and advocated a "people's university" for mechanics and farmers. He favored a protective tariff but only as a means toward ultimate free trade. He worked also for the abolition of capital punishment, for temperance, the formation of labor unions, freedom of speech and the mails and the woman's rights movement.

In the decade before the Civil War Greeley and the *Tribune* gradually centered their attention upon sectional issues. Objecting to slavery for both moral and economic reasons Greeley was aroused to anger by the efforts to expand it and vigorously opposed the Mexican War, the compromises of 1850 and the Kansas-Nebraska bill. His editorials counted for as much as any speeches made in Congress. Gradually deserting the Whigs, in 1856 he attended the national organization meeting of the Republicans in Pittsburgh and that autumn supported Frémont for the presidency. He vigorously urged armed action by the antislavery forces in Kansas and refused to recognize the Dred Scott decision as valid. Having dissolved the long famous political alliance with Seward and Weed, he attended the Republican convention of 1860 as a supporter of Edward Bates but swung to Lincoln. When war was threatened he showed less vacillation than is commonly supposed. Although he declared that if a real majority of southerners wished to secede they should be allowed to depart in peace he asserted that the seceders were actually a minority and should hence be coerced.

During and after the war Greeley's influence rapidly declined. His alignment with the Chase-Sumner radicals led him to make indiscreet attacks on Lincoln. On reconstruction issues he satisfied neither side. Becoming convinced that the Grant administration was corrupt, hostile to civil service reform, illiberal toward the South and mistaken in its Santo Domingo scheme, he encouraged the movement for a new party. But his acceptance of the Liberal Republican nomination for the presidency in 1872 was a tragic error, for it insured the defeat of his cause, and the strain of the campaign hastened his death. His best work had been done in the years from 1841 to 1861, when he impregnated the public mind with new social ideas, lent powerful assistance to the restraint of industrialism and con-

verted a good part of the North to the Free Soil cause.

GREEN, FREDERICK ERNEST (1867-1922), English rural reformer. Green left London to become a small farmer in Surrey, where he threw himself into local life and politics, serving on his parish council and making a study of rural problems. He came to the conclusion that the machinery for democratic local government and provisions which had been created in the nineties for encouraging small holdings were thwarted by the power of the squires and the large farmers. Anxious to learn how far social conditions in the neighboring counties resembled those in Surrey, he traveled about the south of England. The results of his researches he published in *The Awakening of England* (London 1912, 2nd ed. 1918) and *The Tyranny of the Countryside* (London 1913). The latter appeared when a campaign for agrarian reform launched by Lloyd George was in full swing and it gave a great impetus to this movement. The Liberal party prepared a program which would have occupied the attention of Parliament in 1914 and 1915 but for the outbreak of the World War. In 1918 Green stood unsuccessfully for Parliament as a Labour candidate. In the following year his reputation as an expert led to his appointment to the Royal Commission which the government set up to study the position of agriculture. His last book, *A History of the English Agricultural Labourer, 1870-1920* (London 1920), brought together valuable material which had not hitherto been accessible. Green was a vigorous writer with a feeling for landscape and country life, a large store of first hand knowledge and a passion for liberty. His books are essential to the study of the agrarian conditions in the south of England before the World War.

JOHN LAWRENCE HAMMOND

GREEN, JOHN RICHARD (1837-83), English historian. Green, who never held a university appointment, turned to history from another profession in the ripeness of his powers. He was the son of an Oxford tradesman and as an undergraduate attended Jesus College. He found no teacher, however, who shared his deeply ingrained enthusiasm for the study of English social life in the remote past. Ordained to a London curacy in 1860, he was soon led by his democratic sympathies into parish work among the lower classes of the city. Nevertheless, in 1869 he was prompted by reasons of health as well as by a growing liberalism of thought to embark upon a different career. The librarianship of Lambeth Palace gave him a position if not a salary, and meanwhile he supported himself mainly by writing for the *Saturday Review*. His real learning and originality had brought him into contact with historians like Freeman, Stubbs and Bryce and, even more important, with Alexander Macmillan, the publisher, who at the end of 1869 decided to back Green's projected *Short History of the English People*. The book when it came out five years later had a success unequalled since Macaulay; scores of thousands sold in several languages even during Green's lifetime, and it still retains great historical value. For Green was the first man who attempted a complete survey of the history of the English people. His work embraced every factor in national life; but here at last kings and battles and party politics were subordinated to social history and the progress of thought. His sympathies were everywhere with the people at large: in every clash between ruler and population he sided with the latter. His early theological orthodoxy had been transformed into hopes for and belief in the progress of man. His struggles to rewrite the entire work on a large scale (*History of the English People*, 4 vols., London 1877-80) were cut short by his premature death. Green's *Letters* were edited, with commentaries, by Leslie Stephen (London 1901).

GREEN, THOMAS HILL (1836-82), English philosopher and reformer. Green's adult life was spent almost wholly at Oxford, where he was one of the great figures of Jowett's Balliol. His *Lectures on the Principles of Political Obligation* (*Works*, vol. ii; edited after Green's death by

R. L. Nettleship, 3 vols., 2nd ed. London 1889-90), one of the major works of formal political theory in England, gave philosophical foundation to the newer liberalism of the later nineteenth century, which abandoned laissez faire for state intervention in social and economic matters. In 1870 philosophical idealism was identified by the English with Toryism. The German thinkers were known primarily through Coleridge and Carlyle, who were regarded as un-English extremists. On the other hand, liberalism was bound up with empiricism, with a kind of atomic individualism from which even J. S. Mill's practical sympathies for the poor did not allow him to escape. When Green appeared as both idealist and liberal, Mark Pattison regarded the fact as an indication of a "certain puzzle-headedness" in Green.

At the base of Green's system is an idealistic acceptance of the state as an organic society superior to its component individuals. Man is a political animal, and the crude antithesis of the individual and the state is as false as that of a whole and its parts. The state is the consequence of morality and is usually right because it draws on the whole inheritance of past wisdom. Will, not force, is its foundation and the will of the individual must freely acquiesce. Even where the individual judges an act of the state immoral he should in a parliamentary state conform in practise. Overt disobedience is justifiable only in those states where the individual has no channels of peaceful agitation against the act which he considers immoral. Green consistently repudiated the generally accepted ethics of the utilitarian school, particularly as applied to actual problems involving the relations between the state and the individual. To limit state interference to policing individual selfishness represented to him a denial of moral value to the acts of the state; that is, a denial of moral value to the common life of society. True ethics—and these are substantially traditional Christian ethics—demand that the state interfere to insure the possibility of a good life to all its members. The way is thus open to old age pensions, accident and sickness insurance, factory regulation, temperance legislation—to the complicated social work of the modern state. Green's practical influence in England was the greater because he stopped well short of the Hegelian identification of the state with absolute right. His masters were less the German idealists than the Greeks. In education his interests and purposes were much like Matthew Arnold's—the bringing to bear

of the civilizing influence of classical learning in its best sense on the lower middle classes by a reform of secondary education and the initiation of elementary education for the working classes. He wanted all of England to share the virtues and manners of the ruling classes. He convinced many young Oxford men that this was possible and sent them forth to make England better, not through *laissez faire* but through state action. He himself was a member of the Oxford Town Council, an active temperance worker and an important figure in Liberal politics.

GREENBACK PARTY, UNITED STATES.

See PARTIES, POLITICAL; FREE SILVER.

GREENING, EDWARD OWEN (1836-1923), English cooperative leader and social reformer. It is perhaps characteristic of this son of a Lancashire factory owner that during the Civil War in the United States, despite the stake which Lancashire had in the success of the Confederate forces, he was prominent in founding the Union and Emancipation Society of Manchester and financially assisted in the maintenance of "underground railroads" in the United States.

His greatest prominence was in the cooperative movement. So far as the consumers' societies were concerned he stood firmly against a working class bias and was a continual agitator against the dangers of the cash profit. On the other hand, in 1874 he introduced for a short time employees' profit sharing into the Cooperative Wholesale Society. He also endeavored unsuccessfully to make public information as to the allocation of capital acquired by the society. To him was largely due the passing of the Industrial and Provident Societies Act of 1852, which legalized and safeguarded cooperative enterprise. He made the movement national in

scope by bringing in London and the south, whereas it had previously been confined to the industrial midlands and the north; and he played an important part in the founding of the International Cooperative Alliance. Through his organization of the Agricultural and Horticultural Association in 1868 he laid the foundation for a method of reconciliation of agricultural producers' and industrial consumers' societies. As a former Christian Socialist he never quite relinquished the concept of labor copartnership and producers' cooperation. He was a brilliant speaker, an excellent organizer and a tireless pamphleteer and perhaps the main influence in liberalizing the industrial cooperative movement in Great Britain.

F. J. PREWETT

GREGG, WILLIAM (1800-67), American cotton manufacturer and pioneer industrialist in the south. Gregg was born in what is now Monongalia county, West Virginia, of pioneering Scotch-Irish and German ancestry. During the War of 1812 he had his first experience with cotton manufacturing at his uncle's small mill in Georgia. Later he served an apprenticeship in silversmithing, established himself in business in Columbia, South Carolina, in 1824, soon accumulated a fortune and retired to the Edgefield district. Here he amused himself by reviving the fortunes of the Vaucluse cotton factory. In 1838 he moved to Charleston, where he became convinced that the south's single devotion to a staple agriculture was responsible for economic stagnation and abortive partisan politics. Having determined to establish cotton manufacture in the south, he visited the northern textile districts and wrote *Essays on Domestic Industry* (Charleston, S. C. 1845). Gregg was undoubtedly influenced by Mathew and Henry C. Carey of Philadelphia and presented in his *Essays* the same argument for diversification of economic development. He was one of the few representatives in the southern states of this nationalist school of thought, although at this stage his advocacy of manufactures did not embrace a protective tariff. As an object lesson he established a large cotton factory at Graniteville, South Carolina. Around this factory he built a tasteful village for 900 "poor whites," whom he hoped to elevate by industrial employment. The enterprise was notably successful, and the south in its textile development since the Civil War

has returned to many of the precepts which were advocated by Gregg.

BROADUS MITCHELL

Consult: Mitchell, Broadus, William Gregg, *Factory Master of the Old South* (Chapel Hill, N. C. 1928).

GRÉGOIRE, HENRI (1750–1831), French ecclesiastic, parliamentarian and publicist. Grégoire, a curé of Embermesnil, Lorraine, was elected to the Estates General in 1789 and later served in the Convention, in the Council of the Five Hundred, in the Corps Législatif and finally in the Senate. Under the Restoration he was elected to the Chamber of Deputies in 1819 but was refused admittance. Of Richero-Jansenist sympathies, he believed that the lower clergy should be accorded a share in the administration of the church and accepted the civil constitution as well as the oath. He became bishop of Blois and was the real leader of the constitutional church during the period of the separation. Strongly opposed to the concordat, he retired after its adoption to a simple priesthood. The son of a poor tailor, Grégoire consistently championed equality and liberty, supporting the third estate and helping in the destruction of the *ancien régime* and the monarchy. He was a staunch republican, an adversary of personal dictatorship and of the empire. Like Condorcet he attacked ignorance as the chief enemy of the people and labored, especially in the Convention, to extend education and further the use of the French language. He was active in opening up new libraries, schools and scientific and technical institutions, such as the Institut National and the Conservatoire des Arts et Métiers. His broad humanitarianism, which prompted him in 1787 to dedicate a stirring pamphlet to the Jews, was directed particularly to agitation against the slave trade and slavery and to denunciation of the prejudices of white people against the colored races. Pacifist as well as patriot, Grégoire foresaw that Europe, divided by hatreds, would exhaust itself to the advantage of the New World. As a preventive he advocated the development of a spirit of universal cooperation, with the intelligentsia of the various countries taking the lead; and, more specifically, the creation of a universal language.

GREGORY I (c. 540–604), pope from 590. Gregory came of a prominent patrician and Christian family and while still young rose to the prefecture, the highest civil office of Rome. Shortly afterward he turned monk, converting his Caelian palace into a monastery and with the proceeds of the sale of his Sicilian estates founding six other monasteries. From about 579 to 586 he served as papal ambassador at Constantinople and in 590 was elected to succeed Pope Pelagius II. He was the first monk to become pope. The tradition that grew up during the Middle Ages around Gregory, or Gregory the Great as he came to be called, had a firm basis in his achievements. As Fourth Doctor of the Latin church he consolidated the doctrines or the fathers and in so doing established the uniform teaching and practise which became the heritage of the mediaeval church. In his *Regulae pastoralis liber* (*De cura pastoralis*), which became the manual of the episcopate for his own and subsequent times, he condensed the duties of the priest into three categories; these he designated as obligations of conscience, professional obligations and methods of preaching. His homilies on the Gospels and his *Moralium libri*, or commentary on the book of *Job*, resolved the whole Christian life, to use the words of Pierre Batiffol, "into clear, complete and effective formulae." His *Dialogorum libri*, especially the second book, settled the destinies of Benedictine monasticism by elevating St. Benedict above all other founders of monasteries. On one side of his nature Gregory was a pessimist: a patri-

cian who saw himself hemmed in by barbarians, he had a premonition of the imminent fall of Rome, as his eloquent homilies on *Ezekiel* show; and he believed the end of the world to be at hand. But the man of action was brought to the surface by the papal office. While solicitous to respect the privileges of other metropolitans he nevertheless upheld the superiority of the bishop of Rome with a combined tact and consistency which contributed greatly to the development of the Roman primacy. In the relations between Rome and neighboring peoples, particularly the Lombards, and in matters of the internal administration of Rome he assumed the authority legally vested in the secular government, thus making the first organized attempt on the part of the papacy to exert temporal power 150 years before Pippin the Short established this power on a firm footing. When he sought to create a *societas* (what the Middle Ages called the *pax christiana*) between the Lombards and Byzantine Italy, when he arrogated to himself the right to mediate between the Frankish kingdoms and Byzantium, he originated the idea that the papacy was the guardian of a Christian peace between secular powers. At his direction St. Augustine and forty monks undertook a missionary expedition to England, achieving a success which led Gibbon to declare that "the conquest of Britain reflects less glory on the name of Caesar than on that of Gregory the First." By this enterprise Gregory inaugurated the period of systematic evangelization of the western world under the guidance of the Holy See and through the agency of monks. His letters on the administration of the Patrimony of St. Peter throw much light on the ideas of his time concerning the obligations of the ecclesiastical landlord and indicate his feeling of social responsibility in such matters as the care of the poor.

GEORGES GOYAU

Works: Gregory's writings are published in Migne, J. P., *Patrologia latina*, 221 vols. (Paris 1844-80) vols. lxxv-lxxix. An excellent edition of his letters is *Gregorii I papae registrum epistolarum*, ed. by P. Ewald and L. M. Hartmann, *Monumenta Germaniae historicae, Epistolarum*, vols. i-ii (Berlin 1891-99). The *Regulae pastoralis liber* and a selection of the letters have been translated by James Barnby in *A Select Library of the Nicene and Post-Nicene Fathers of the Christian Church*, 14 vols. (New York 1886-90) vols. xii-xiii. *Moralium libri* has been translated by J. Bliss as *The Books of Morals, A Library of Fathers of the Holy Catholic Church*, vols. xviii, xxi, xxiii and xxxi, 3 vols. (Oxford 1845-52).

GREGORY VII (c. 1020-85), pope from 1073. When the cardinals, seconding the choice of the masses, elected Hildebrand pope, he had already held a dominant position under the pontificates of Nicholas II (1059-61) and Alexander II (1061-73). He assumed the tiara not only with a consummate experience in ecclesiastical affairs but with a well worked out program of church reform. In his earliest bulls he announced his intention to exercise the Roman primacy in its plenitude and through this power to uproot the two major evils of the church, simony and Nicolaitanism, or moral corruption, which in spite of the brave but insufficiently coordinated efforts of earlier popes and reformers were still rampant. A council which he summoned in 1074 vigorously condemned both of these practises, but its decrees had little effect and in Germany provoked active resistance. In February of the following year Gregory called a second council. Besides reissuing the regulations of 1074 and pronouncing severe penalties for rebellious prelates this council promulgated the famous decree on lay investiture forbidding bishops to receive their offices from laymen. As had previously been suggested by the Lorraine reformers, Wazo of Liège and Humbert of Moyenmoutier, Gregory thus prepared to attack the problems of simony and of Nicolaitanism, which clearly grew out of simony, at their roots: corrupt practises could be abolished if corrupt men could be excluded from the episcopal body. He proposed to enforce his views by centralizing the administration of the church in the Holy See and to this end he drew up and published while the council of 1075 was in session his great *Dictatus papae*. With incisive clarity and compelling brevity the twenty-seven articles of this document asserted the exaltation of the papal office; its divine origin; its infallibility; its absolute, unlimited and universal authority not only over the church but over Christian society as a whole. As sovereign of the church the pope could depose bishops at will; as sovereign of society he could depose emperors and kings and absolve their subjects from allegiance.

Gregory's importance lies not so much in his enactments as in the uncompromising and fearless spirit in which he attempted to make them a matter of daily reality. As means of subjugating

the bishops he summoned an annual synod at Rome to pass reform legislation and inflict penalties on the refractory. He dispatched a constant stream of legates into various countries and in addition assigned permanent bodies of plenipotentiary legates to definite territories. Since the legates under Gregory exercised the mounting power of the Holy See with uniform moderation and justice, a notable reform was achieved. In his energetic efforts to impose the *Dictatus papae* upon the secular princes Gregory became involved in one of the most famous church and state controversies of the Middle Ages. In overt defiance of the decree of 1075 the German king Henry IV continued to follow the traditional imperial custom of making ecclesiastical appointments. When Gregory protested, Henry deposed him through an assembly of German prelates which he summoned at Worms in 1076. Gregory responded by excommunicating and deposing Henry. Shortly afterward the German princes revolted against Henry's despotism, solicited Gregory's pardon and invited the pope to try the king in their presence at Augsburg. In order to evade the dangers of such a trial Henry proceeded to Canossa, where he intercepted the pope on January 28, 1077. After the abject king had waited for three days barefooted in the costume of a penitent, Gregory overwhelmed by his "perseverance" finally admitted and absolved him. Although politically Canossa was a victory for the king, Gregory had nevertheless achieved all that he desired in demonstrating the papal power to "bind and loose" in accordance with the dictates of the Christian religion. But the controversy was not yet ended. Upon repeated proofs of Henry's knavery Gregory once more excommunicated him in 1080 and recognized as King Henry's rival Rudolph of Swabia. In 1081, after having set up an antipope, Henry descended into Italy and began a three years' siege of Rome, which ended with Gregory's flight to Salerno, where he died.

Gregory's imperviousness to threat and peril is well evidenced by his epistle to Hermann, bishop of Metz, written on March 15, 1081. Crystallizing his ideas on the relations of church and state, this epistle demonstrated the superiority of the spiritual power to the royal in both nature and origin and concluded by reducing secular princes to the rank of papal auxiliaries, whose supreme function was to assist in the salvation of souls. But whether in his relations with Henry IV, the Spanish princes, the kings of Denmark, the duke of Bohemia or with papal vassals like the king

of Croatia-Dalmatia and the king of Kiev, Gregory's purpose was entirely religious, involving no encroachment upon the purely temporal authority. His whole pontificate, one of decisive importance in the history of the church, was illumined by his single minded aim to assure the triumph of the Christian spirit and morality, of which he was one of the ablest as well as the most ardent guardians.

AUGUSTIN FLICHE

Works: Gregory's *Register* has been edited by E. Caspar in *Monumenta Germaniae historica, Epistolae selectae*, vol. ii, pts. i-ii. The *Dictatus papae* appears in this edition in pt. i, p. 201-08, and the epistle to Hermann in pt. ii, p. 544-63.

GRENVILLE, GEORGE (1712-70), British statesman. In 1741 Grenville entered the House of Commons as member for the borough of Buckingham and retained the seat until his death. He was secretary of state for the northern department in Bute's ministry and on Bute's resignation in 1763 became first lord of the Treasury and chancellor of the Exchequer. The Seven Years' War had added some £60,000,000 to the national debt and half the yield of the staple taxes was required to meet its annual charge. There were prospects of incalculable additional liabilities across the Atlantic. Grenville, whose official experience had been gained at the Admiralty and Treasury, had been impressed during the war by the amount of illicit trade carried on by the American colonists. He also realized that some new sources of revenue would have to be found. So he decided to en-

force the acts of trade and to renew and make effective the Molasses Act of 1733, which had never been more than a dead letter. In the Sugar Bill [4 Geo. III, c. 15 (1764)] the principle was laid down that a revenue ought to be raised in America for the defense of the colonies, and in the following year Parliament tried to realize this end by imposing an internal tax under the Stamp Act. Grenville's name will always be associated with this ill fated measure because it inspired a united opposition in the colonies, and although it was repealed by the Rockingham administration it proved to be the first step toward secession. Several pamphlets have been ascribed to Grenville and it is known that he assisted William Knox in the composition of *The Present State of the Nation; Particularly with Respect to Its Trade, Finances, etc.* (London 1768), a pamphlet which drew a retort from Burke and a brief comment from Adam Smith. In the year of his death Grenville successfully sponsored a significant reforming measure, known as the Grenville Act, which as a remedy against the prevalent evils arising from the trial of election petitions provided that such trials should be in the hands of a select committee, authorized to examine witnesses under oath, rather than of the entire House of Commons. His character is sketched in a well known passage in Edmund Burke's *Speech on American Taxation*; and contemporary letters in such collections as the *Grenville Papers* (ed. by W. J. Smith, 4 vols., London 1852-53), the *Chatham Correspondence* (ed. by W. S. Taylor and J. H. Pringle, 4 vols., London 1838-40) and the *Correspondence of the Duke of Bedford* (3 vols., London 1842-46) throw much light on his character and influence.

J. F. REES

GRESHAM, SIR THOMAS (1519?-79), English merchant and financier. Gresham was educated at Gonville Hall, Cambridge, and apprenticed to his uncle Sir John Gresham. He was admitted a member of the Mercers' Company in 1543. In 1551 he was appointed royal agent, or factor, and his main duty was to manage the king's debt abroad. This involved his frequent residence in Antwerp, where he had immediately to face a very difficult problem. Royal creditors had to be paid large sums at a moment when the exchange rate was unfavorable to England. The steps he took are described by himself in a letter to Elizabeth. The account is not very lucid, which may be due partly to the fact that he

naturally wanted to impress on the young queen the importance of the service he had performed and partly to his own misconceptions as to the actual working of the exchanges. It is clear, however, that he contrived to pay an instalment of the royal debt by preventing the Merchant Adventurers from exporting their cargoes of cloth until they had engaged to meet the demands of the king's creditors in Antwerp out of the yield of their sales there. In this way he really exacted a forced loan, which was subsequently to be repaid with interest in London. In return the Merchant Adventurers were given the virtual monopoly of the export of cloth. Gresham recommended this method of meeting obligations in the Low Countries on several occasions and expounded it in a letter to William Cecil in some detail in March, 1559. In 1554 he was dispatched to Spain to collect in bullion loans which he had negotiated with merchants in Antwerp and to arrange for its shipment to England. Gresham advised Elizabeth to undertake a restoration of the currency, explaining how Henry VIII's debasement had driven fine gold out of the country. On the strength of his exposition of the fact that "bad money drives out good" this principle has been called Gresham's law since H. D. MacLeod introduced the usage in 1858. The fact, however, was known long before Gresham's time and there is nothing to show that Gresham offered any theoretical exposition of this principle. Gresham was concerned that the London merchants had no definite place of resort such as was provided by the Bourse in Antwerp, and he offered in 1564 to erect one at his own expense if the city would provide a site. This is the origin of the Royal Exchange, which was opened by Elizabeth in January, 1571.

J. F. REES

Consult: Burgon, J. W., *The Life and Times of Sir Thomas Gresham*, 2 vols (London 1839); Unwin, George, *Studies in Economic History*, ed. by R. H. Tawney (London 1927).

GREY, SECOND EARL, CHARLES GREY (1764-1845), English statesman. Grey was educated at Eton and Cambridge for a parliamentary career and when only twenty-two years old was returned for Northumberland. His interest in parliamentary reform led him to take part in the organization and activities of the Friends of the People, a venture which he regretted later in life. Grey participated with other Foxites in the secession of 1797. He was from the first a close

follower of Fox and on Fox' death succeeded him as foreign secretary under Grenville and as leader of the more liberal Whigs. After 1807 his removal to the Lords and his long absences from Parliament left the championship of reform to others; in the troubled years after 1816 he was eager to oppose the government but refused to combine with the radicals. At length in 1830 he formed a ministry of wide political range, pledged to parliamentary reform. Convinced that only an extensive measure would satisfy public opinion but that the established institutions of the country need not thereby be endangered nor the influence of the aristocracy impaired, he entrusted the drafting of the ministerial reform bill to a committee headed by his son-in-law, Lord Durham, an advanced reformer. Grey showed extreme skill in handling king, cabinet, Parliament and outside critics, and the passing of the bill in 1832 without a special creation of peers was his crowning triumph. In foreign affairs he worked successfully as Palmerston's chief for the enlargement of the frontiers of Greece and for the establishment of Belgian independence without a breach with France.

Grey's main achievements were the maintenance for a generation of the Foxite tradition of an aristocratic party which supported popular principles and to which the democratic forces could and would rally, and the enactment by constitutional means of a measure of parliamentary reform moderate enough for king and aristocracy to swallow and extensive enough to satisfy the middle classes and to enlist the popular support required for carrying it.

GREY, THIRD EARL, HENRY GEORGE (1802-94), British statesman. Grey's chief claim to fame is his work as colonial secretary in Lord John Russell's Whig ministry from 1846 to 1852. As undersecretary from 1830 to 1833 he had become interested in the problems of the abolition of slavery and the government of Canada as well as in the theories and colonizing projects of Gibbon Wakefield. He also came to believe that the new policy of free trade would strengthen rather than break up the British Empire, making it clear that the only enduring ties were those of enlightened self-interest and mutual good will. He was anxious as colonial secretary not only to transfer the empire to a free trade basis but to

concede to the colonies the fullest self-government compatible with their social condition and with the maintenance of imperial unity. During his regime Canada and other North American colonies received responsible government, with the proviso that they adhere to the free trade policy of Great Britain. He liberalized the institutions of other colonies also, although he believed the Australian colonies to be too thinly peopled and too inexperienced politically for full responsible government and thought it essential in New Zealand and Cape Colony that the imperial government should remain responsible for relations between the colonists and the native races. While sharing the public dislike of financial commitments he stood for a more positive native policy than previous colonial secretaries and was fertile in suggestions as to aims and methods. He was wrong, however, in thinking that New Zealand and Cape Colony would long rest content with imperial control of native policy, just as he was wrong in thinking that the colonies could be denied autonomy in tariff matters. After 1852 Grey confined himself to independent criticism in the House of Lords. Although not as extreme a pacifist as Bright or Cobden, Grey attached great importance to international peace and like them attacked the Crimean War as unnecessary and unjustifiable.

W. P. MORRELL

Important works: *Colonial Policy of Lord John Russell's Administration*, 2 vols. (London 1853, 2nd ed. 1853).

Consult: Morison, J. L., *British Supremacy and Canadian Self-Government, 1839-1854* (Toronto 1919) p. 267-90; Morrell, W. P., *British Colonial Policy in the Age of Peel and Russell* (Oxford 1930).

GREY, SIR GEORGE (1812-98), British colonial administrator and New Zealand politician. Grey, the son of an army officer, was educated at Sandhurst and entered the British army in 1830. He explored the northern coast of Western Australia from 1837 to 1839 and was governor resident at King George's Sound the following year. From 1840 to 1861 he served successively as governor of South Australia, New Zealand and Cape Colony. On the outbreak of the second Maori war in 1861 he was again made governor of New Zealand and served until 1868. He entered the New Zealand Assembly as representative for Auckland in 1874 and became premier in 1877. His ministry, which lasted for two years, passed the law providing free compulsory secular education in 1877 and the first land tax in 1878. Grey sat as a private member

until 1890 and again in 1893-94, when he returned to England.

Service in Ireland as a young officer had given Grey strong views in favor of freehold as the basis for land settlement. He put these into practise in South Australia and New Zealand, where he reduced the price of land to foster closer settlement. In the latter colony he thereby unwittingly made possible large scale holdings of land repugnant to his theory of land tenure.

Except for his failure to settle the second Maori war Grey was highly successful in his treatment of natives. He gained Kaffir and Maori confidence through his marked interest in their welfare, education and folk customs. His *Polynesian Mythology* (London 1855) is one of the earliest and best accounts of Maori legends. The libraries which he left to Cape Town and Auckland contain valuable collections dealing with the aboriginal tribes.

During his first governorship of New Zealand, Grey gave to self-government, established in 1852, a definite bias toward provincial decentralization. He entered New Zealand politics in 1874 to wage an unsuccessful fight against the abolition of the provincial system. He contributed to New Zealand political life many of the Liberal ideas, such as manhood suffrage, closer settlement and land taxation, which were later put into practise by the Liberal-Labour party, most of whose leaders were as young men associated with him during his premiership. He was the pioneer of New Zealand's colonial ambitions in the South Sea Islands as he had been in the South African federation as early as 1858. Grey's services to New Zealand, Australia and South Africa mark him as one of the great imperialists.

Consult: Rees, W. L., *Life and Times of Sir George Grey* (Auckland 1892); Henderson, G. C., *Sir George Grey: Pioneer of Empire in Southern Lands* (London 1907); Collier, J., *Sir George Grey: an Historical Biography* (Christchurch 1909).

GRIESINGER, WILHELM (1817-68), German psychiatrist. Griesinger was born in Stuttgart in 1817, the son of a hospital administrator. He entered the *Gymnasium* as a precocious boy of eight years and at seventeen entered the University of Tübingen, where he soon became interested in medical studies. He took his medical degree at Zurich in 1838. After studying in Paris and Vienna and acting for two years as second assistant to Zeller at the Winnenthal mental

hospital at Bodensee he started general practise in Stuttgart in 1842 but during the next year became assistant to Wunderlich in Tübingen in internal medicine. Here he began a series of physiological researches upon pain, psychical reflexes and brain disturbances which he published in the *Archiv für physiologische Heilkunde*, of which he later became editor for two years. Three years later he published his textbook of psychiatry, *Pathologie und Therapie der psychischen Krankheiten* (Stuttgart 1845, 5th ed. by W. Levinstein-Schlegel, Berlin 1892; tr. by C. L. Robertson and J. Rutherford, 2nd ed. New York 1882). He then served successively as associate professor in general pathology, materia medica and the history of medicine at Tübingen, as professor of pathology at Kiel, as director of the medical school in Cairo and as director of the medical clinics at Tübingen and Zurich. From Zurich, where his psychiatric studies had begun to take more definite shape, he went to Berlin as professor of psychiatry and established a clinic for psychiatry and neurology after visiting Paris and England to study methods of investigating and teaching these subjects. In 1867 Griesinger founded the *Archiv für Psychiatrie und Nervenkrankheiten*.

Griesinger's chief work was in psychiatry, to which he gave a general philosophical orientation. There was much of Herbart's influence in his early writings and his psychiatry, modeled after Zeller, was marked by a much more thorough grasp of the entire personality of the sick individual than was that of many of his contemporaries. He considered psychiatry and internal medicine closely interrelated, as is shown by his physiological studies on psychical reflexes and his very penetrating researches in brain structure and functioning, in which one finds much that is distinctly modern on the subject of mental participation in reflex action and bodily tonus.

SMITH ELY JELLIFFE

Consult: *Deutsche Irrenärzte*, ed. by Theodor Kirchhoff, vols. i-ii (Berlin 1921-24) vol. ii, p. 1-14; Westphal, C., and Lazarus, M., in *Archiv für Psychiatrie und Nervenkrankheiten*, vol. i (1868-69) 760-82.

GRIFFITH, ARTHUR (1872-1922), Irish national leader. Son of a printer and himself a printer by trade, Griffith lived in Dublin except for two lonely years in the diamond mines of South Africa, from 1896 to 1898, and several terms of fruitful association with other Irishmen in English prisons, from 1916 to 1918. For over a

decade he was one of the "isolated cranks" who formed the national conception in the depressed period caused by the fall of Parnell and the bickerings of the Irish parliamentary party. Freed from clericalism by the Parnell split, well versed in Wolfe Tone and John Mitchel, he turned first to the non-political Gaelic revival and then to trenchant political journalism. The *United Irishman*, which he edited from 1900, expounded nationalism as a doctrine of unbending self-reliance against the supplience of the parliamentary party. In 1904 he published *The Resurrection of Hungary: a Parallel for Ireland* (Dublin) and the next year at a convention in Dublin enunciated the Sinn Fein policy. Sinn Fein means "ourselves." Without advocating an armed rebellion Griffith urged a dual monarchy to be secured by Ferencz Deák's methods: non-cooperation at Westminster, a voluntary national assembly, voluntary people's courts, boycott of English goods and of recruiting for the army, war on Anglicization and emigration and every emphasis on national distinctiveness in art, literature, clothes, games, education. The German economist Friedrich List inspired Griffith's economics and he frowned on the English liberal tradition and international trade unionism. Carson's volunteer movement against home rule gave actuality to Griffith's "somewhat puerile proposals." Left behind by the republicans and socialists who led the Easter rising of 1916, his was the administrative plan that fitted the country when Sinn Fein superseded the parliamentarians at the 1918 elections. He headed the delegation that negotiated the treaty in 1921, and he and Michael Collins secured its ratification in the June elections of 1922. His broad belief in a "common nation," once legislative independence was secure, guaranteed the former Unionists their place in the Dail. Griffith's pungent nationalism, based on a doctrine of stubborn self-reliance and maintained during two Spartan decades, proved far from intransigent when it came to the negotiations in London. Once he accepted the treaty, Griffith was severe on dissentients.

FRANCIS HACKETT

M., "Arthur Griffith, théoricien du Sinn Fein" in *Vie des peuples*, vol. viii (1922) 345-63; McDara, "Arthur Griffith and Michael Collins" in *Fortnightly Review*, vol. cxviii (1922) 744-57; "La situation en Irlande—la mort de Griffith et de Collins" in *Correspondant*, vol. cclxxxviii (1922) 769-800.

GRIFFITH, SIR SAMUEL WALKER (1845-1920), Australian statesman and judge. Griffith came from Wales to Queensland in 1854; he entered the legislative assembly in 1871, served as attorney general in 1874, as premier from 1883 to 1888 and from 1890 to 1893, as chief justice from 1893 to 1903 and as the first chief justice of Australia from 1903 to 1919. Griffith, like Deakin, was the radical leader of a Liberal party far removed from the laissez faire tradition, and he set Queensland well on its path of advanced social experiment and state action. Perhaps his most enduring political achievements were to check the use of Pacific island labor in the sugar industry and to prevent the northern districts from seceding to form a society like that of the West Indies, based on colored labor. As chief justice of Queensland Griffith, drawing largely on Italian sources, prepared the first criminal code to be adopted in a common law country.

Griffith was an ardent federalist in the eighties and the chief draftsman of the constitution bill of 1891, which transformed federation from a hope to a practical program. A keen student of American federalism, he would have sacrificed even the British system of responsible government to make a strong senate.

He dominated the High Court of Australia during its first sixteen years. In constitutional matters he took John Marshall as his guide, adopting principles of interpretation familiar in the United States, to preserve the federal nature of the constitution and especially to maintain the powers of the states. Three weeks after his death the High Court, much changed in personnel, abandoned the principles of interpretation which he had maintained and facilitated a great extension of the central government's powers.

GRIFFUELHES, VICTOR (1875-1922), French syndicalist. Griffuelhes played an important role in the development of revolutionary syndicalism. The presence of a socialist, Millebrand, in the Waldeck-Rousseau ministry (1899-

1902) resulted in divisions in the ranks of both the socialists and the syndicalists; among the latter there took place a long polemic between the reformists and the revolutionaries. Griffuelhes, who had first belonged to the anarchist group, was one of the most ardent of the revolutionaries; he was elected secretary of the *Confédération Générale du Travail* and his ideas of non-political syndicalism triumphed at the syndicalist congresses of Bourges in 1904 and Amiens in 1906. According to Griffuelhes the working class should act independently of governments and political parties; it should struggle against all forms of oppression, material and moral, by its own means of action. These means were: the strike—not the mere stoppage of work, but the militant strike and general strike inspired by the idea of conflict; antimilitarist propaganda to weaken the army, the principal support of capitalism; direct action, peaceful or violent according to necessity, for the final overthrow of capitalism. He also insisted that syndicalism be distinct from and independent of the Socialist party; a resolution to this effect was adopted under his influence by the congress of Amiens. The resolution has remained celebrated among French workmen, who call it the *Charte d'Amiens*. When the Clemenceau ministry took repressive measures against the syndicalist movement, Griffuelhes called on the workmen to resist. But internal quarrels in the *Confédération Générale du Travail* forced him to resign as secretary in 1908, and this marked the end of his active participation in the syndicalist movement.

GRIMM, JACOB LUDWIG KARL and WILHELM KARL, German philologists. These founders of scientific Germanistics worked so much together that they signed many of their books simply "Die Brüder Grimm." Jacob (1785-1863) was unquestionably the more scientific, Wilhelm (1786-1859) the richer in poetic sensibility. Born in Hanau, they had a penurious youth. They studied law in Marburg and were deeply influenced by Savigny. Both became librarians in Cassel and devoted themselves to the publication of Old High German, Middle High German and Scandinavian poems. The brothers were called to Göttingen in 1830 but, forced to

leave in 1837 because they opposed the king of Hanover's breach of the constitution, took up residence in Berlin as members of the academy. From the outset Jacob took the romantic position in a long feud with contemporary literary scholars. Like Hamann and Herder he venerated national, indigenous, anonymous folk poetry, not merely on aesthetic grounds but because it contains relics of the mythos, i.e. the primitive folk wisdom. Not a narrow nationalism but the philosophic romanticism of Schelling, Görres, Creuzer and Kanne, the view that the mythos glimpsed more of truth than reason, impelled the brothers Grimm to make such great collections of folk poetry as the *Kinder- und Hausmärchen* (3 vols., Berlin 1812-22; new ed. by R. Steig, Stuttgart 1912; tr. by A. Lucas, L. Crane, and M. Edwards, Philadelphia 1916), written down from the mouths of the people; the *Deutsche Sagen* (2 vols., Berlin 1816-18; new ed. by H. Floerke, 1911); and the *Irische Elfenmärchen* (Leipsic 1826). The *Hausmärchen* has been called the most widely used German home book after the Bible and along with Arnim's collection is the ideal of the younger romantic poets. Jacob wrote standard works of four new sciences: the history of the Germanic languages, of German law, of folklore and of comparative mythology. His *Deutsche Grammatik* (4 vols., Göttingen 1819-37; new ed. by W. Scherer, G. Roethe, and E. Schröder, Berlin 1870-98) and his *Geschichte der deutschen Sprache* (2 vols., Leipsic 1848; 4th ed. 1880) determined the laws of sound changes in Germanic languages and developed the idea that every language has a particular spirit standing in a mysterious relationship to the national character. Scientific comparative linguistics and scientific etymology as well as speculations regarding ethnic relationships on the basis of common language forms now became possible for the first time. In the *Deutsches Wörterbuch* undertaken by the Grimms and continued by M. Heyne and others (vols. i-xvi, Leipsic 1845-1931), Jacob revealed the richness and historical suggestiveness of the German language. His *Deutsche Rechtsalterthümer* (2 vols., Göttingen 1828; 4th ed. by A. Heusler and R. Hübner, Leipsic 1899) and the supplementary *Weisthümer* (7 vols., Göttingen 1840-78; finished by Richard Schroeder), collections of village laws as drawn up by peasants in the later Middle Ages for their own use, were for him a sort of grammar of law. His basic thought was that the older imaginative, vital, legal conception was thickly overlaid by Roman and French logical law. This idea, a

fine intuition for the other romanticists, became with Grimm the basis of scientific scholarship. His investigation of legal symbols revealed hidden meanings in many old usages that the *Aufklärung* had declared meaningless. Similarities to ancient, oriental, Celtic legal customs Grimm believed must be explained by primitive race kinship. This theory has met with much opposition, especially in the field of the history of religion, and the *Deutsche Mythologie* (Göttingen 1835; 4th ed., Berlin 1875-78; tr. by J. S. Stallybrass, 4 vols., London 1880-88) is in fact the most out of date of his works. It glorifies German heathendom somewhat uncritically, forgets the difference between the north Germanic and German, does not put clearly the questions of remote inheritance, psychological consensus or borrowings and ignores temporal stages. This work is remarkable not for its profound grasp of principles but for its perfection of observation. Grimm based all these works on national linguistic sources, for he was of the opinion that "knowledge of the indigenous" was to be preferred to all foreign lore, both because we can grasp nothing else as surely with our innate powers and because "Nature herself guides us toward the fatherland." Thus he directed German scientific interest, which in the age of Winkelmann and Goethe was fixed on the ancient world, to Germany's own past. The brothers Grimm had, however, no thought of breeding an overweening nationalism, but rather that of paving the way for a profounder comprehension of German character, a national self-knowledge.

RUDOLF STADELMANN

GROCERY TRADE. *See* FOOD INDUSTRIES.

GROLMAN, KARL VON (1775-1829), German jurist. Grolman was one of the chief figures in the great movement of reform which at the end of the eighteenth century and the beginning of the nineteenth freed Germany from the mediæval criminal law. As in the case of most of his contemporaries, he was impelled by the forces of natural law, the Enlightenment and the Kantian critical spirit. His work on the fundamental

principles of the science of criminal law, published at the age of twenty-three, was in his time widely read and influential. In agreement with the general tendency of his rationalistic epoch, Grolman made the attempt to reconstruct the whole of the criminal law upon a unifying general principle—the principle of "special prevention." In the imposition of punishment the character of the evildoer was to be considered decisive. The deeper a man's criminal tendencies were rooted, the greater was the danger that he would lapse again into crime and the more unmistakable and incisive should be the reaction of the criminal law. Grolman's teaching that the extent of punishment should depend upon the personality of the perpetrator of a crime has much in common with modern tendencies in criminological science but it held no promise of lasting effect in his own time. The first edition of his chief work involved him in a ten-year controversy with Anselm von Feuerbach, the chief exponent of the principle of "general prevention," who in the end emerged the victor and the founder of a new German school of criminal law.

ERICH SCHWINGE

Important works: *Grundsätze der Criminalrechtswissenschaft nach einer Darstellung des Geistes der deutschen Criminalgesetze* (Giessen 1798, 4th ed. 1825); *Über die Begründung des Strafrechts und der Strafgesetzgebung nebst einer Entwicklung der Lehre von dem Massstabe der Strafen und der juridischen Imputation* (Giessen 1799).

Consult: Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. ii, p. 139-44; Grünhut, Max, *Anselm von Feuerbach und das Problem der strafrechtlichen Zurechnung* (Hamburg 1922) p. 31-59.

GROSS, CHARLES (1857-1909), American historian. Gross' special field of interest was English constitutional history in the Middle Ages, particularly guilds and towns from the eleventh to the fourteenth century. After receiving his doctor's degree at Göttingen in 1883 Gross continued his researches in English archives and in 1888 joined the department of history at Harvard University, where he remained until his death. His course on English constitutional history came to be regarded as almost indispensable for students of history. Under his influence several students, who were later to occupy prominent places in historical scholarship, concentrated on narrow fields of research, sought and minutely examined manuscript sources and exercised caution in historical

statement. He was the first to give international distinction to historical work at Harvard.

Gross' reputation as a historian rests primarily upon the *Gild Merchant* (2 vols., Oxford 1890), which was his doctoral thesis (*Gilda mercatoria*, Göttingen 1883) amplified and documented. He was not a pioneer but a constructively critical worker in the field of guild history. He corrected a number of writers on the subject, chief of whom was Lujo Brentano. To be sure, both Stubbs in England and Ochenkowski on the continent had challenged Brentano, but Gross supported his own position by minute research and careful statement. According to him guilds arose along with sundry other institutions to take the place of the old undivided family group. Although guilds in general are referred to in continental sources earlier than in English, the merchant guild, which was somewhat like the modern local chamber of commerce, appeared in England before it did on the continent and played an important part not in the origin but in the development of the mediaeval borough. His book displays great skill in presenting a clear argument and in massing facts, some pertinent to his theme and others not less valuable, by means of text, footnotes, appendices and index. Arising out of his guild studies and by way of preparation for his further municipal researches came his *A Bibliography of British Municipal History* (Harvard Historical Studies, vol. v, New York 1897). Gross' interest in the history of the Jews, which was doubtless partially due to his own ancestry, is indicated by his *The Exchequer of the Jews in England in the Middle Ages* (London 1887). His *Select Cases from the Coroners' Rolls A.D. 1265-1413* (Selden Society Publications, vol. ix, London 1896) and *Select Cases concerning the Law Merchant—Local Courts A.D. 1270-1638* (Selden Society Publications, vol. xxiii, London 1908) are examples of careful scholarly editing. His *The Sources and Literature of English History . . . to about 1485* (London 1900, 2nd ed. 1915) is a model of accuracy, clarity and critical judgment as well as a monument of industry and learning. Not long before his death he began a comparative study of mediaeval municipal institutions.

N. S. B. GRAS

GROSS, HANS (1847-1915), Austrian criminologist. After serving as a judge in Graz and teaching in the universities of Czernowitz and Prague, Gross was appointed professor of criminal law in the University of Graz. There he

organized the first institute of criminalistics, a field of investigation in which he was the pioneer. He sought to apply the research methods of the natural sciences to the administration of justice. The first notable fruit of these efforts was the *Handbuch für Untersuchungsrichter als System der Kriminalistik* (Graz 1893, 6th ed. Munich 1914), which contained discussions of fields auxiliary to criminal law, such as detective services, thieves' cant and thieves' sign language and the study of weapons and of clues. In his later larger works, *Encyklopädie der Kriminalistik* (Leipsic 1901), *Raritätenbetrug* (Berlin 1901) and *Kriminalistische Tätigkeit und Stellung des Arztes* (Vienna 1908; tr. by H. M. Kallen, Boston 1911), Gross extended the scope of the field of criminalistics. He also grasped the importance of psychological processes in the administration of criminal law, as is shown by his book *Kriminalpsychologie* (Graz 1898, 2nd ed. Leipsic 1905). In 1898 he founded the *Archiv für Kriminal-Anthropologie und Kriminalistik* (published quarterly in Leipsic), which is indispensable for every worker in this field.

GUSTAV ASCHAFFENBURG

Consult: Straffella, F. G., and Zafita, H., in *Archiv für Kriminal-Anthropologie und Kriminalistik*, vol. lxxv (1916) i-v; Gault, R. H., in *American Institute of Criminal Law and Criminology, Journal*, vol. vi (1915-16) 641-42.

GROSSE, ERNST (1862-1927), German art historian and sociologist. Grosse, who was a professor at the University of Freiburg, contended in his pioneer work, *Die Anfänge der Kunst* (Freiburg i.Br. 1894; English translation, New York 1897), that a close interrelation exists between the economic organization of a society and its spiritual life, especially its art. Marx and Engels had given logical form to this concept in their materialistic interpretation of history, but Grosse was the first to collect evidence from the field of art to support it. He discussed the psychological and economic bases of changes in primitive art and attempted to discover the determinants of naturalistic and conventionalized art styles. His conclusion that primitive gatherers and hunters developed a naturalistic art whereas agriculturalists of a later economic age arrived at conventionalization in art has influenced the more detailed researches of Hoernes, Verworn, Kühn and others. Grosse also drew attention to the fact that a knowledge of a people's art facilitates an understanding of its culture; it was not a mere coincidence that he

published studies in sociology simultaneously with his work on the history of art.

In his *Die Formen der Familie* (Freiburg i.Br. 1896) Grosse discussed the sociological basis of the family, attempted to correlate types of family organization with forms of economic life and showed the significance of the family in the cultural history of mankind. He also published studies in the history of mediaeval and modern art and was a specialist in East Indian art.

HERBERT KÜHN

Consult: Vonwiller, O., in *Artibus Asiae*, vol. ii (1927) 300-05.

GROSSETESTE, ROBERT (c. 1175-1253), English scholar and churchman. Grosseteste was born at Stradbroke, Suffolk. At Oxford he pursued an academic career in arts, law, medicine and theology. Soon after 1208 he was appointed master of the Oxford schools (the office later being given the title of chancellor). In 1224, yielding to the persuasion of the Franciscans, he became although himself not a friar the first regent of their Oxford school of theology. The distinguishing characteristics of the intellectual movement which emanated from this school during the thirteenth century and culminated in the work of Roger Bacon may be traced to Grosseteste. In the realm of science, or natural philosophy, he laid great emphasis on the use of mathematics and recognized, although less keenly than Bacon, the necessity of verifying conclusions by experiment. Skilled in Hebrew and Greek, he seems also to have initiated the movement for the study of languages which is associated with the Oxford school. To his contemporaries he was famous for his Latin translations of the apocryphal *Testament of the Twelve Patriarchs*, of pseudo-Dionysian writings and of the epistles of St. Ignatius, as well as of the *Nicomachean Ethics*. Among his numerous manuscripts, which disclose an original mind embracing an encyclopaedic variety of subjects—philosophy, theology, ethics, physics, optics, astronomy, geography, calendar reform—is a shrewd pamphlet on estate management, *Les reules Seynt Roberd* (ed. and tr. by E. Lamond in *Walter of Henley's Husbandry*, London 1890), attesting his interest in scientific agriculture. He also caused Walter of Henley's famous treatise on husbandry to be translated into English.

In 1235 Grosseteste resigned the regency of the Franciscan school to become bishop of Lincoln. To this office he brought a conception of the spiritual and humanitarian role of the church

which in many ways reflects the Franciscan ideal and which inspired him to attempt a severe reform. Building upon an exalted idea of episcopal authority he was brought into litigations with his dean and chapter as well as with the monks in his diocese and into disputes with the king, the archbishop of Canterbury and finally, to his disappointment, with Pope Innocent IV. The multitude of his controversies has tended to obscure his essential role in the church and state problem. Grosseteste was the most distinguished spokesman of his time of the ideas of Christian unity and papal authority. Unity he believed to be expressed through the intimate bond between the bishops and the first bishop of Rome; it was to the pope that the bishop must look for his chief support in uprooting the abuses which impeded his Christian mission. While Grosseteste firmly opposed the intrusion of secular authority into ecclesiastical affairs, he was far from indifferent to political matters. Through his friend Simon de Montfort, whom he frequently advised in that statesman's formative years, he exercised some influence upon English constitutional development.

BEDE JARRETT, O.P.

Works: Grosseteste's philosophical works have been edited by L. Baur (Münster 1912). His letters have been published in the Rolls series, ed. by H. R. Luard (Great Britain, Public Record Office, *Rerum britannicarum medii aevi scriptores*, no. xxv (1861).

GROTE, GEORGE (1794-1871), English historian. Grote was the son of a well to do banker. He left Charterhouse at the age of sixteen with but the rudiments of a classical education and entered his father's business. While practising his inherited profession he devoted his spare time to widening his acquaintance with Greek and Latin literature and studying philosophy and political economy. At a decisive moment in his life (1817-18) he became an intimate friend of Ricardo and James Mill and through them of their master Bentham. He thus joined the group of philosophical radicals and for ten years after the Reform Bill of 1831 he represented them and the city of London in Parlia-

ment. Thereafter his chief public interest was in the new University of London.

Grote's project of writing the history of Greece was prompted by dissatisfaction with the antidemocratic bias of Mitford and was thus political in its inception. On retiring from Parliament he found for the first time leisure to proceed systematically with its execution. Rationalist in his religious outlook, utilitarian in his philosophical creed, liberal in his political and economic conceptions, convinced that "with all governments to do evil is easy—to effect beneficial change difficult," he escaped being a mere propagandist by his disinterested love of truth, his Thucydidean sense of the extraordinary difficulty of ascertaining what actually happened and his rare ability to sink himself in the mind and spirit of the age he recorded. It is to be recognized that Grote worked with a strong prejudice in favor of "liberty," that he included in his leisurely argumentative narrative everything which could be said in extenuation of Athenian democracy; it is to be recognized also that his interest flagged when this democracy had run its course and that he lacked understanding for the sweep of Greek cultural development during the Hellenistic age then little investigated. Yet it must be insisted that his sound practical sense, his fairness in presenting opposing views and his untiring energy in amassing and assessing evidence enabled him to do such justice to the real experience of the Greeks that for fifty years his history formed the acknowledged basis for all further scholarly work in this field. His later years were devoted to studies of Plato and Aristotle.

GROTIUS, HUGO (Huigh de Groot) (1583–1645), Dutch jurist. Grotius studied at the University of Leyden and became a lawyer at the age of fifteen. In 1613 he was induced by the lord advocate of Holland, John of Oldenbarneveldt, to enter politics; and he thereby became involved in the fervent controversies between Calvinists and non-Calvinists. After Maurice of

Orange's coup d'état of 1618 he was imprisoned for life in the castle of Loevestein but succeeded in escaping in 1621 and fled to Paris. During the ten years that he passed in France Grotius wrote the most famous of his books, the *De jure belli ac pacis*, a systematic treatise on the whole of positive law which governs mankind and its political organizations excepting national or municipal law. Between 1625 and 1631 Grotius revised and enlarged the book and shortly after the end of his stay in France he published a second edition in Amsterdam in 1631, which should be considered as constituting its definitive text. The three later editions prepared by Grotius in 1632, 1642 and 1646 did not change the book further; except that the edition of 1642 added a large number of additional quotations in notes, reprinted in 1646.

The book has four main characteristics. First, it subjects the conduct of sovereign states to the same all embracing set of rules which governs the conduct of private men, and thereby set up, in accordance with the older Spanish moralists and with Grotius' own lawyer's argument of 1604–05 in his *De jure praedae*, a high standard for their mutual behavior; waging war in violation of these rules, he held, was a crime liable to punishment. Second, he took his elaborate set of rules, found in book ii, chapters i–xix, from Biblical and ancient history, from Scripture and from the classics. This important part of Grotius' book—"the law of peace"—had no parallel in the work of any predecessor; it was a marvel of inductive juridical composition and formed the foundation of the whole system. Third, Grotius pleaded in contradistinction to Vitoria and Suárez that not only superiors but also equals are authorized to inflict punishments and by this theorem construed war as a punitive sanction against state crimes parallel to municipal sanctions against crimes of individuals. The law of war discussed in book iii was meant only for states maintaining interstate law by force—not for every national war. Its contents were partly borrowed from Ayala, Gentili and others. Fourth, Grotius based the binding force of this imposing system on a theory of natural law which was upheld for nearly two centuries. The natural law theory of Grotius coincided with that developed by Suárez in his *Tractatus de legibus ac Deo legislatore* (Antwerp 1612) and in his *Opus de triplici virtute theologica* (Lyons 1621). Grotius, however, seems to have known the first work but superficially, while he was apparently ignorant of the second.

Grotius' work was held in high respect until the later part of the eighteenth century, when Vattel's works with their adulation of state sovereignty temporarily superseded it. In the next century, however, Grotius regained his old renown, thanks to Wheaton, Hallam and others.

In the autumn of 1631 Grotius risked a return to Holland. For three months he practised law in Amsterdam. The states of Holland, however, renewed his proscription of 1619, and in 1632 he escaped to Hamburg. This disappointment proved to be the great breakdown in Grotius' life. His three years' stay at Hamburg was the most melancholy period of his life. An appointment as Swedish ambassador at Paris from 1635 to 1645 proved merely a temporary relief from sorrow. After having resigned in 1645 Grotius traveled to Sweden to see Queen Christina and died on the return journey.

The last ten years of Grotius' life, although filled by numerous valuable publications on philology, theology and history, were devoted to the cause of reuniting the hopelessly divided Christian nations. This desire had become a real obsession with Grotius. In his view the reformers might have preserved much more than they did of the traditions of the Roman Catholic church, but there is no proof that he would ever have acquiesced in the dominating position of the clergy. Neither Grotius' hope for international law nor that for Christian unity was fulfilled.

Although Grotius' chief renown lies in the field of law, his personal taste was more in the direction of classical and theological studies. He was also an eminent historian and well versed in philosophy.

Grotius' critical studies on classic texts are still admired as highly as those of Scaliger and Salmasius. His philosophy was of the Aristotelian stamp. To Descartes he paid no attention, and in the field of international state duties Hobbes was his antipode. His historical books mainly relate to the history of the Netherlands and to the early history of the Goths. His commentaries on the Bible contain views confirmed by the critical studies of the nineteenth century and his exegesis is exemplary. Grotius himself saw his contribution to constitutional law in a few Aristotelian chapters of his *De jure belli ac pacis*, but according to modern views it is rather contained in his controversies on the positive state powers in the Dutch Republic. His *Inleiding tot de hollandsche rechts-geleertheid* (The Hague 1631; ed. by S. J. F. Andreae and L. J. van

Apeldoorn, 2 vols., 3rd ed. Arnheim 1926; tr. by C. Herbert, London 1845), a work on Roman Dutch law, is a famous textbook to this day.

GROUP. There is a wide variety of meanings attached to the term group; different kinds of reality are imputed to the concept by psychologists and sociologists of different schools. To some the group is a primary concept in the study of human behavior; many sociologists say that the individual has no reality, aside from his biologically defined body, except as a carrier or crystallizer of meanings that are derivative of group action and interaction. To others, however, the individual remains as the sociologically primary entity and groups are the more or less artificial constructs which result when individuals, viewed as essentially complete physical and psychological entities, come into contact with each other. For the former sociologists a child can hardly be said to have social reality except in so far as there is in prior existence a supporting family or social agency substituting for the family and a fairly well defined set of rules of behavior defining the relation between the child and such a family. In much the same sense there would be no such individual as a musician except in so far as there are such groups as conservatories, historically determined lines of musicians and musical critics, dancing, singing and playing associations of varying degrees of formal organization and many other types of groups whose prior definition is needed to make the term musician actual. For the latter sociologists the child and the musician exist as given types of individuals, whether they are so born or so conditioned; and the groups which the sociologist discovers as operative in the behavior which actualizes such individual terms as child or musician are merely ad hoc constructions due to the specific experiences of individuals either

within a given lifetime or over many generations. The difficulty of deciding whether the group or the individual is to be looked upon as the primary concept in a general theory of society is enhanced by fatal ambiguities in the meaning of the term group.

Any group is constituted by the fact that there is some interest which holds its members together. The community of interest may range from a passing event which assembles people into a momentary aggregate to a relatively permanent functional interest which creates and maintains a cohesive unit. The crowd which forms when there is an automobile accident, drawn together in the first place by a common curiosity, soon develops certain understandings. Its members may feel themselves to be informally delegated by society to observe and eventually report or to help with advice or action or, if there has been an infraction of the traffic rules, to constitute a silent or audible image of criticism. Such a group cannot be despised by the sociologist for all its casualness of form and function. At the other extreme is such a body as the United States Senate, which is fixed as to numbers, principle of selection, time of meeting, function and symbolic importance in a representative capacity. The former consists of individuals who do not feel that they are assuming a known or imputed role when they become members of the group; the latter is constituted by political and legal theory and exists in a sense in advance of the appearance of specific members, so that those who actually take part in deliberations of the Senate are something other than or beyond themselves as individuals. There is in reality no definite line of division anywhere along the gamut of group forms which connect these extremes. If the automobile accident is serious and one of the members of the crowd is a doctor, the informal group may with comparatively little difficulty resolve itself into something like a medical squad with an implicitly elected leader. On the other hand, if the government is passing through a great political crisis, if there is little confidence in the representative character or honesty of the senators or if an enemy is besieging the capital and likely at any moment to substitute entirely new forms of corporate authority for those legally recognized by the citizens of the country, the Senate may easily become an unimportant aggregation of individuals who suddenly and with unexpected poignancy feel their helplessness as mere individuals.

Sociological theory can hardly analyze the

group concept into its various forms unless it uses definable principles of classification. The primary principle of classification may rest on the distinction between physical proximity on the one hand and the adoption of a symbolic role on the other. Between the two extremes comes a large class of group forms in which the emphasis is on definite, realistic purpose rather than on symbolism. The three major classes of groups are therefore those physically defined, those defined by specific purposes and those symbolically defined. Examples of simple physical groups are a bread line, a little crowd milling in the lobby of a theater between the acts of a play, the totality of individuals who look on at a football game, a handful of people going up in an elevator and a Saturday afternoon crowd on Fifth Avenue. Groups possessed of a relatively firm organization and of a real or imputed specific purpose are, for example, the employees of a factory, the administrative personnel of a bank or stock company, a board of education, a society for the prevention of cruelty to animals, the taxpayers of a municipality, a trade union viewed as an agency for securing certain economic advantages to its members and a state legislature viewed simply as an agency of government. Groups of the third type differ from those of the second in that to external organization and one or more well defined functions there is added the general symbolic function of securing for the individual an integrated status in society. Examples of such symbolically defined groups are the family; the membership of a particular church or of a religious denomination; a political party in so far as it is not merely a mechanism for the election of political officers; a social club in so far as it means more than a convenience for luncheon or an occasional game of billiards; a university group looked at as something over and above an instrumentality for specific types of education; the United States Senate as a responsible spokesman of the American government; a state as the legalized representative of the nation; a nation as a large aggregate of human beings who feel themselves to be held together by many ties of sentiment and which believes itself, rightly or wrongly, to be a self-sufficient social entity in the world of physical necessity and of human relationships.

The examples have been purposely chosen to suggest doubts and multiple interpretations. Some degree of physical proximity is either required or fancied in order to make for group cohesiveness; some degree of purpose or func-

tion can be found in or rationalized for any conceivable group of human beings that has meaning at all; and there is no group which does not reach out symbolically beyond its actual composition and assigned function. Even so wide a group as a political party needs from time to time to give itself the face to face psychology of a mere physical gathering, lest the loyalty and enthusiasm which spring from handshakes, greetings, demonstrations, speeches and other tokens of immediate vitality seep away into a colorless feeling of merely belonging. The members of a church, standing obviously as a symbol of the relation between God and man, carry definite purposes of a practical sort, such as the securing of burial rights. Symbolisms of a potent sort may be illustrated in groups which are most readily classified under the first and second rubrics. Thus, a passer by may be attracted to the casual crowd brought together by an automobile accident not because he thinks he can be of any particular assistance nor because he is devoured by curiosity but merely because he wishes half unconsciously to register his membership in the human universe of potential suffering and mutual good will. For such an individual the nondescript group in question becomes the mystic symbol of humanity itself. Thus defined it may be more potent in a symbolic sense than the nation itself. So clearly defined a functional group as a board of education has or may have a symbolic significance for its community that far transcends its avowed purposes. Nevertheless, there are few groups of human beings that cannot be readily classified as coming primarily under one or the other of the three indicated heads. This tripartite classification is easiest to apply in the modern civilized world. In less sophisticated folk cultures and to an even greater extent in primitive societies the possibility of allocating groups to one rather than another of the three types becomes more difficult. Physical contact, a bundle of common purposes and heavy saturation with symbolism tend to be typical of all groups on these more primitive levels.

The suggested classification is based on an analysis of groups from an objective standpoint; that is, from the standpoint of an observing non-participant or the standpoint of humanity or the nation or any other large aggregate in which the significance of the individual as such tends to be lost. The interpretation of the various types of groups from the standpoint of individual participation offers new difficulties, and new principles

of classification may be ventured. Individuals differ in the degree to which they can successfully identify themselves with the other members of the group in which they are included and in the nature of that identification. Such identification may be direct, selective or referential. Direct participation implies that the individual is or feels himself to be in a significant personal relation to all or most of the fellow members of the group with whom he comes in contact. For such an individual the reality of a committee, for instance, is not given by its external organization and assigned duties but rather by his ability to work with or fail to work with particular members of the committee and to get his own purposes accomplished with or in defiance of their help. A selective type of participation implies that the individual is able to identify himself with the group only in so far as he can identify himself with one or more selected members of the group who stand as its representatives and who tend to exhaust for the individual the psychological significance of the group itself. Or the selection may act negatively, so that the significance of the group is damaged for the individual because of feelings of hostility toward particular members of the group. This type of group identification is common in the workaday world. Referential participation implies that the individual makes no serious attempt to identify himself with some or all of the actual membership of a group but feels these fellow members to be the more or less impersonal carriers of an idea or purpose. This is essentially the legalistic type of approach.

The type of individual participation in the group and its purposes has something to do with its unconscious classification, so that the objective and subjective points of view are not in reality distinct. It is well to keep them apart, however, and to look upon them as intercrossing classifications. The least significant type of group psychologically would be the mere physical group with referential participation of the individual. The group so defined is little more than a statistical entity in the field of population. At the other extreme is the symbolically defined group with direct individual participation. Great art brings to the interpretation of symbolically defined groups, which tend to be somewhat colorless as human entities because of their indefinite membership, the touchstone of direct participation. In Hauptmann's *Die Weber* (Berlin 1892; tr. by M. Morison as *The Weavers*, London 1899), for instance, German labor, a symbolically defined group as conceived by the

dramatist, is made doubly significant because of the illusion of direct participation in its membership.

The nature of the interest which lies at the basis of the formation of the group varies indefinitely. It may be economic, political, vocational, meliorative, propagandist, racial, territorial, religious or expressive of general attitudes or minor purposes, such as the use of leisure. To go into the details of the organization and purpose of such specifically defined groups would be tantamount to a description of the institutions of society. A popular classification of groups has been into primary or face to face groups and secondary groups. This is a convenient descriptive contrast but it does not take sufficient account of the nature of individual participation in the group. The distinction becomes of greater value if it is interpreted genetically as a contrast between those types of participation which are defined early in life and those which come later as symbolic amplifications or transfers of the earlier participations. From this point of view membership in a labor union with a dominant leader may have the value of an unconscious psychological recall of one's childhood participation in the family. Still another type of classification of groups which can readily be made is that based on the degree to which groups are self-consciously formed and group membership is voluntary. From this point of view the trade union or political party contrasts with the family or the state. The individual enters into the latter type of group through biological or social necessity, while he is believed to align himself with a trade union or political party without such necessity. This distinction is misleading, for the implicit social forces which lead to membership in a given political party, for instance, may for many individuals be quite as compulsive as those which identify him with the state or even the family. To make too much of the distinction is to confuse the psychological realities of various forms of participation with the roles which society imputes to the individual. The plurality of groupings for any one individual is a point that sociologists have emphasized. If one looks beyond the groups which are institutionally defined—in other words, beyond associations in the narrow sense of the word—any society, above all the complex society of modern times, has many more groups of more or less psychological significance than it possesses individuals who participate in these groups.

The changes in social groupings, studied partly

through historical evidence, partly through the direct observation of contemporary trends, constitute a large part of the history of society. There are changes in the actual personnel of groups resulting from realignments brought about by such factors as economic change and changes in the means of communication, changes in the deepening or the impoverishment of the symbolic significance of the group and changes in the tendency to a more or to a less direct participation of the individual in his group. These types of change necessarily condition each other in a great variety of ways. An example of the first type is the gradual increase in the total potential membership of the political parties of England and the United States. The fact that individuals without property and women now share in the activities of the parties means that their present symbolic significance is different from what it originally was. Examples of the second type of change are provided by the universal tendency for groups which have a well defined function to lose their original function but to linger on as symbolically reinterpreted groups. Thus a political club may lose its significance in the realistic world of politics but may nevertheless survive significantly as a social club in which membership is eagerly sought by those who wish to acquire a valuable symbol of status. The third type of change is illustrated by the recent history of the American family, in which on account of many disintegrating influences direct and intense participation has become less pronounced. As far as the relation of brothers and sisters is concerned, for instance, the participation frequently amounts to hardly more than a colorless awareness of the fact of such kinship. Developments in the family illustrate the general tendency in modern life of secondary and voluntary groupings to assume the dominant role as against the primary and involuntary ones. Closely connected with this is the greater mobility of group membership due to a variety of factors, among which are increased facilities of transportation, the gradual breakdown of the earlier symbolic sanctions and an increasing tendency to conceive of a group as fundamentally defined by one or more specific purposes. Groups that are relatively permanent because they are needed to carry out important purposes tend to become more and more institutionalized. Hiking clubs, for instance, have replaced the more casual association of three or four men for the purpose of walking together in the country.

In the discussion of the fundamental psy-

chology of the group such terms as gregariousness, consciousness of kind and group mind do little more than give names to problems to which they are in no sense a solution. The psychology of the group cannot be fruitfully discussed except on the basis of a profounder understanding of the way in which different sorts of personalities enter into significant relations with each other and on the basis of a more complete knowledge of the importance to be attached to directly purposive as contrasted with symbolic motives in human interaction. The psychological basis of the group must rest on the psychology of specific personal relations; no matter how impersonally one may conceive the behavior which is characteristic of a given group, it must either illustrate direct interaction or it must be a petrified "as if" of such interaction. The latter attribute is, however, not the peculiar property of group psychology but is also illustrated in the relations of single human beings toward one another. It is only an apparent contradiction of this point of view if the individual, as he so frequently does, allows himself to be controlled not by what this man or that man says or thinks, but by what he mystically imputes to the group as a whole. Group loyalty and group ethics do not mean that the direct relationship between individual and individual has been completely transcended. They mean only that what was in its origin a relation of individual dominance has been successively transferred until it is now attributed to the group as a whole.

The psychological realities of group participation will be understood only when theorizing about the general question of the relation of the individual to the group gives way to detailed studies of the actual kinds of understanding, explicit and implicit, that grow up between two or three or more human beings when they are brought into significant contact. It is important to know not only how one person feels with reference to another but how the former feels with reference to the latter when a third party is present. A latent hostility between two persons may be remedied by the presence of the third party, because for one reason or another he is an apt target for the conscious or unconscious hostility of both. His presence may serve to sharpen hostility between the persons because of his attractiveness for both and the consequent injection of a conscious or unconscious jealousy into the relations that obtain between them. Precise studies in the psychology of personal relations are by no means immaterial for the profounder

psychological understanding of the group, for this psychology can hardly be other than the complex resultant of the pooling, heightening, canceling, transfer and symbolic reinterpretation of just such specific processes. As psychology recognizes more and more clearly the futility of studying the individual as a self-contained entity, the sociologist will be set free to study the rationale of group form, group function, group changes and group interrelationships from a formal or cultural point of view.

GROUP BUYING. *See* RETAIL TRADE.

GROUP INSURANCE is a form of insurance contract which grants protection to a group of individuals as distinct from the ordinary insurance contract with a coverage for one individual only. The typical form of group insurance is that contracted for by a business concern on behalf of all or most of its employees; but the benefits of this type of insurance have also been available under certain conditions to various other groups such as trade unions, consumers' cooperative societies, employees of large educational institutions, units of the National Guard and state police, borrowers from financial corporations, subscribers to periodical publications

and many associations which were not formed for insurance purposes. The term group insurance first came into use in the United States in 1911 as the technical designation of a form of life insurance provided by an insurance carrier for a group of employees on behalf of their employer. In this narrower sense group insurance is still largely limited to a coverage against the death hazard, although at present group insurance contracts are written to include also total and permanent disability, the general hazard of illness and accidental injury and retirement annuities. It should be observed, however, that workmen's collective insurance, limited largely to industrial accidents, which may be regarded as an older form of group insurance, has been written by casualty companies since 1896, fifteen years before compulsory workmen's compensation was introduced in any American state.

Group life insurance in the United States is of fairly recent origin. The first important contract, covering 3000 employees and calling for about \$6,000,000 in insurance, was issued in 1912 by the Equitable Life Assurance Society. Since then the volume of group life insurance has increased very rapidly, the rate of its growth being much greater than that of ordinary life insurance. Regarded from the start as one of the means of reducing labor turnover, it received a vigorous stimulus during the war and the first prosperous years of peace; thus by the end of 1920, 6118 group policies were reported with over \$1,600,000,000 of insurance. Its decline in 1921, a year of acute depression, was much smaller than that of workmen's compensation insurance. By the end of 1922 it exceeded by about \$250,000,000 its 1920 volume and in the following period, being accepted as one of the features of the employee welfare policy adopted by many large corporations, it grew almost as rapidly as in the early years of its history. According to the latest data available, by December 31, 1930, the amount of insurance had increased to about \$10,000,000,000. The total number of persons covered is not definitely known, but as the average amount of insurance coverage per person has been reported as approximately \$1200, it appears likely that some 8,000,000 employees were receiving the benefits of this form of protection.

There are about fifty companies in the United States writing group life insurance; the six largest companies, including the Equitable, Travelers, Aetna, Metropolitan and Prudential, carry over 90 percent of the total. The hesitancy of most insurance companies except those of

first magnitude to enter this field is explained by the size of the average risk, which may include thousands of lives and millions of dollars of insurance and is not altogether free of the possibility of catastrophe hazard. Moreover, as the average life insurance agent does not possess the requisite knowledge and experience to interpret group insurance to prospective purchasers, a special selling organization is necessary, which can be profitably maintained only by a large carrier.

The conditions of group life insurance are largely governed by legislation adopted in 1918 by the state of New York and followed by many other states. This legislation allowed group insurance to be written by contract between an insurance carrier and an employer covering the lives of his employees, the minimum number of the latter being placed at fifty, and required that the premium be paid entirely by the employer, i.e. on the non-contributory plan; or that it be shared by employer and employee, i.e. on the contributory plan; and that the insurance benefits shall not be payable to the employer. Under the non-contributory plan all the employees who had passed the probation period or all of them in definitely described classes must be covered. Under the contributory plan, which requires the acceptance of the plan by the employees, at least 75 percent of the latter must be insured. The law was amended in 1925 to permit the issue of group insurance to labor unions and in 1929 to allow financial institutions to obtain group insurance for borrowers to the extent of their indebtedness but not to exceed \$10,000.

Under these limitations any standard form of life insurance—whole life, level premium or even endowment insurance—may be written. But in actual practise the one-year renewable term plan, under which no reserves need to be carried over the end of the year, is used almost exclusively. Under this plan the net cost of insurance, depending upon the expected mortality at each age, necessarily increases for each insured life every year. In actual industrial experience, however, the age distribution of the employees varies but little from year to year; the average age of the labor force is kept fairly stationary by the separation of older persons and the addition of younger employees. The cost of group life insurance remains therefore stable; and ordinarily insurance carriers would not hesitate to guarantee the employer against an increase in premium rates for a period of five years. The net cost of insurance is computed on the basis of the age of

each employee and the amount of his coverage; the latter may be uniform or vary according to length of service, salary or position. After the usual or necessary expense loadings are added, the total is divided into the aggregate amount of insurance to obtain the quotable premium rate per \$1000 of insurance. When the contributory system is used the payment by the employee is based on this premium rate rather than on age, health or other risk factors. The employee, however, does not benefit as a rule from the minor adjustments in the rate due to changes in the labor force during the year and, under the participating plan, to the profits of the carrier from this type of business.

Although in the early years of the business there has been considerable variation in the procedure by which premium rates were computed, the premium quoted at present is fairly uniform except for a few extrahazardous industries. Actuaries may at present rely upon experience relating specifically to group life coverage as distinct from ordinary life insurance. Moreover since 1926 the minimum basic rate has been regulated in the state of New York as to a number of factors which enter into its composition, such as mortality experience, interest rate and certain expense loadings. The usual premium has been about \$10 a year for every \$1000 of insurance. Even when entirely paid by the employer the cost is thus only a very insignificant addition to the pay roll, somewhat less than 1 percent on the average. When distributed between the employer and employee the burden becomes even lighter.

While the earlier contracts were largely of the non-contributory kind, there has been a decided tendency in recent years toward the contributory form of policy, with an increasing proportion of the premium coming from the employees. In 1921 one large company reported 85 percent of the new business written on the non-contributory plan, but by 1925 this had been reduced to only 10 percent. Although employees cannot be charged more than 60 cents monthly per \$1000 of insurance, it was estimated in 1927 that employees in the United States and Canada pay from two thirds to three quarters of the cost of group protection. To a large extent this has been due to the efforts of the insurance companies to increase their business, employers being more easily convinced when the cost to them is substantially reduced or almost entirely eliminated. Since the contributory plans seldom apply to the entire labor force and in absence of

medical examination may permit of some adverse selection, actuaries have viewed this tendency with some apprehension; but so far no disastrous results have been discovered.

Paralleling the growth of the standard form of group life insurance there were evolved certain supplementary forms serving the same purpose. So-called wholesale insurance covers groups including from ten to fifty employees and therefore ineligible for a group policy. The rates charged are considerably higher than in the straight group form, satisfactory health statements are required and no single policy is issued for the group as a whole, each insured person obtaining an individual policy. More closely resembling the standard form is the so-called salary allotment or pay roll deduction insurance usually taken out in addition to a non-contributory group life policy. While no medical examination is required, the premium rate for it is somewhat higher than for the standard form and the entire cost is charged to the insured employees by the concern which acts as a collecting agency.

Another development in the group life field is the gradual extension of this form to cover also permanent and total disability. In a sense this duplicates the addition of a similar protection to ordinary life insurance policies, which involves only a small extra cost because of the infrequency of the hazard. Although the addition of a disability clause calls merely for the payment of an amount equal to the death benefit, this provision aroused the apprehension of actuaries because total and permanent disability might be expected to be more frequent among industrial groups than with ordinary life insurance policyholders. Past experience, however, has not justified these fears; while disability claims have been gradually rising they have amounted to only 10 percent of the total and have not exceeded 75 percent of the expectation.

A much more recent and also rapidly growing form of group insurance is specifically limited to temporary disability and is known as group health insurance. It was given a strong stimulus by the agitation for social health insurance in 1916 and 1917. The leading life insurance companies, which were largely instrumental in resisting the social insurance movement, found after some experimentation that it is a profitable addition to their own business. In many cases they have induced employers to change from independent sick benefit funds to a group health insurance policy by pointing to their greater ex-

perience in handling all insurance claims and to the desirability of eliminating the employer as a factor in the frequently arising cases of dispute between the claimant and the insurance carrier. In view of the fact that workmen's compensation has practically become universal throughout the country disability policies cover illness and disability from non-industrial accidents. These two are written either on a contributory or non-contributory plan. They usually offer a weekly disability benefit not exceeding two thirds of the wage and also specific sums for covering cost of medical aid; the period for which such benefits are paid is generally limited to twenty-six weeks, although some policies extend this period to one year. A "waiting period" from three to seven days during which no benefits are paid is quite common; experience has demonstrated that even a slight increase in the waiting period substantially reduces the cost of insurance because most cases of illness are of a comparatively short duration.

Even more recent than group health insurance is the group pension, or group annuity, contract which has been experimented with since 1921. It is not very practicable as a separate coverage, particularly in the case of younger employees, since its benefits accrue only if the insured remain with the same employer until he reaches the retirement age, although a provision may be made for the refund of the surrender value to the employee when he quits employment. Its appeal to the employer is also limited; he often insists on restricting this type of insurance to a small group whose continued loyalty is particularly valuable. Therefore this type of coverage is written mostly in conjunction with other forms of group insurance.

That the insurance companies have found group insurance a desirable and profitable form of business is demonstrated by the very sensational growth in volume, which would have been impossible without very active selling campaigns. Its advantages to the carrier are quite obvious. Group insurance is large scale business, the average coverage of a life policy having increased from some \$250,000 in 1920 to \$500,000 in 1930. This mass selling requires very little effort and expense per \$1000 of insurance. Similarly mass collection of premiums has eliminated a very heavy cost, particularly when compared with industrial life insurance with its tremendous overhead for weekly collections of small amounts. Moreover there is a very low lapse ratio as compared not only with industrial but even with

ordinary life insurance, in which the high lapse ratio has always remained a very costly and difficult problem. As a rule companies refuse to accept groups previously covered by other carriers, and the business therefore is stable and increasing almost automatically. Finally, records are extremely simple: practically no reserves are required and dividend computations and payments are made on whole policies rather than on individual risks. All these factors aid materially in reducing the cost and enable insurance companies to quote very low rates and still write the insurance on a profitable basis.

From the employer's point of view the advantages of group insurance are virtually the same as those responsible for all other forms of voluntary welfare work in industry. Group insurance is expected to improve relations between capital and labor. It is supposed to create a feeling of loyalty to the employer—not only on the part of the employee but to an even greater extent on the part of the latter's family—to reduce labor turnover and both directly and indirectly to increase efficiency of labor. How far these expected results have actually materialized it is of course very difficult to show. But at any rate the cost to the employer is comparatively insignificant, and it grows smaller as the contributory plans gain in popularity. In participating policies with dividends payable to the employer the cost to the employer in many cases is almost nil.

The problem of the advantages accruing to the insured employees is somewhat more complicated. Undoubtedly group insurance has offered to millions of wage earners an amount of insurance which ordinarily they would not and could not have provided for themselves because of excessive cost. The one-year renewable term policy, particularly when averaged up in a large group, is the cheapest form of insurance possible. The fact that most of this insurance is written without medical examination enables an appreciable proportion of employees, estimated at something like 20 percent, to obtain insurance from which otherwise they would have been disqualified as a result of some physical impairment. In addition, the very fact of group action facilitates consent to purchase insurance which individual initiative might not have provided. Group insurance, the average amount of which has been gradually increasing to some \$1200 per insured life, offers protection to dependents approximately to the extent of a year's wages, which is a much larger sum than the average face of an industrial policy. It has been reported

that some two thirds of the employees upon whose deaths group insurance benefits were paid had left no assets whatever or less than \$500 in value. In over 40 percent of the cases no other insurance was available, not even a small industrial policy. Where other insurance was carried it amounted on the average to some \$2000, but this high figure is largely due to the fact that group insurance includes the higher paid employee as well.

While protection at low cost is an indubitable advantage, group insurance has been opposed by organized labor in the United States because of a number of disadvantages inherent in it from the points of view of the insured employee and the labor movement. Group insurance depends upon employment and therefore does not offer the permanency of coverage provided by an individual policy. If very strictly constructed this limitation might almost nullify the entire value of group life insurance unless the employee dies "with his boots on," because in most cases discontinuance of employment due to illness does not automatically retain the employment contract in force. To meet this difficulty the insurance contracts usually provide for a limited period of coverage extending beyond actual and active employment so long as the employer is willing to pay the premium; thus a short period of illness would not destroy the life insurance coverage. Moreover, as it is customary to require a certain period of employment before inclusion under the group insurance plan in order to safeguard the insurance plan from the effect of inclusion by floaters, insurance coverage would not have the continuity of protection which is usually considered necessary. And of course it may leave the employee unprotected when he reaches the age of compulsory retirement with his death and sickness hazard at its greatest and his opportunity for purchasing insurance practically gone. Some adjustment for discontinuity of coverage is provided by improved group contracts which allow for conversion of the one-year term policy into some other standard form of insurance if the employee so desires at the time of his separation from the insured employer, such conversion to be granted without medical examination. As the cost of converted protection is much higher than under the group policy and the opportunity is presented to the employee at the time when he is least able to avail himself of it, the actual number of such conversions has as yet not exceeded 2 percent of the total covered by group life policies. It is doubtful whether insurance car-

riers would continue to grant this privilege were it utilized more extensively, since the amount of claims under converted policies is much greater than it should be on the basis of ordinary actuarial experience. Finally, since group insurance is written on an annual plan it offers no guaranty of permanency to the insured group of employees. It may be arbitrarily withdrawn, its continuance being obviously dependent upon the good will of the employer and the success of the business. Actual experience, however, has not shown this to be of common occurrence, even though there was an increase of cancellations during the depression of 1920-21.

Other disadvantages of a broader social character have also been brought forth. It has been claimed by representatives of organized labor that since the cost of insurance on a one-year term plan increases with age, group insurance might create a serious motive for discrimination against older employees. While there is an unmistakable tendency among large employers so to discriminate, it is impossible to evaluate the importance of group life insurance in this connection; this contention is undoubtedly of greater weight in dealing with sickness and annuity insurance. It has also been argued that group insurance interferes with the free mobility of labor. How far the accumulated interest of participation in a group policy would interfere with the freedom of the employee's choice is problematic, but obviously reduction of labor turnover cannot be accomplished without actual reduction in mobility of labor. Perhaps the most important argument of organized labor is that at an insignificant cost, much smaller than the differential between union and non-union wages, and for a promise of protection, the uncertainty of which the employees may not realize, the employer tends to obtain increased loyalty on the part of his employees. Loyalty, potential or actual, to the labor union is thus undermined, particularly when the benefit of group insurance is conditional upon membership in a company mutual benefit association.

As a result of this feeling organized labor did accomplish modification of the law so that labor unions may also obtain group policies to cover their membership. In addition the American Federation of Labor sponsored the organization of the Union Labor Life Insurance Company to write individual insurance at reduced prices and to provide group insurance for labor unions. Union group insurance, however, has developed but slightly because it lacks many of the techni-

cal advantages offered by an establishment policy. The consent of individual members scattered among different employers cannot be so readily obtained. The question of collection of dues becomes more complicated for the insurance company unless the union serves as an intermediary in attaching the insurance premium to the union dues. Nor do insurance companies favor this form of insurance because of fear of adverse selection, and when they write it they charge higher premiums.

While group life insurance and to a lesser extent other forms of group insurance have offered a certain degree of security to an increasing number of employees in the United States, they cannot be advanced as an American substitute for the European equivalent, compulsory state social insurance. One need only compare the average amount of insurance carried by the worker under a group policy with the death benefits provided for by even the less liberal compensation laws to realize the limitations of group insurance. At best group insurance depends to a large extent upon the free will of the employer. Frequently it places upon the employee a much larger proportion of the cost than does social insurance and it never offers that complete and guaranteed security which is the very fundamental principle of the latter. While it has done a great deal to demonstrate the comparative cheapness of mass insurance it has not met and cannot be expected to meet in full the real problems created by numerous hazards confronting the wage worker's life.

Group insurance is in the experimental stage in application to groups other than those of wage earners and salaried people employed by private concerns. While the insurance carrier must be constantly on guard against an adverse selection of risks—and for this reason reinsurance is consistently refused, for instance, to fraternal societies—there are a number of groups in which the principles of mass sales, comparative ease of collection and low cost of premium come into play almost as forcefully as in the standard forms of group insurance. Thus there has recently been a great deal of discussion regarding group policies for teachers and a few policies for large amounts have been written. Similarly the lives of real estate mortgagees or of purchasers on the instalment plan may be insured as a group. The benefit in such cases is the waiving of all future payments due in case of death, the purchaser thus offering to his family the assurance that the property only partly paid for will not be lost.

Outside of the United States group insurance is a phenomenon of relatively minor importance and interest. It is less clearly restricted to groups of employees and when so used it serves merely as an addition to compulsory social insurance. In England, for example, group insurance begun after the World War is written by only seven companies, and carriers specializing in life and annuity business refrain from issuing group contracts. It is still the subject of controversy among actuaries. As the labor contract is settled by collective bargaining and as workmen's compensation and health insurance is compulsory, the employer does not stand to gain much by introducing group insurance, particularly since the exigencies of insurance law favor the non-contributory plan. Employee group insurance is therefore limited in scope, but consumers' co-operative societies sometimes insure their members in proportion to the amount of their purchases. In Germany group insurance comparable to the American form is still in its initial stages. It began to develop after November, 1925, when the legal ban caused by the abuse of the group form was modified to allow the charging of rates on the basis of reduced tables and reduced cost factors. Group policies are issued not only to private employers but also to public bodies employing labor, to trade unions and other occupational associations. Disability protection is often combined with life insurance. Before the World War what might be regarded as a special form of group insurance was provided by newspapers and magazines for their subscribers; it covered the public accident hazard and in some cases also the professional liability hazard. It is reported that in 1911 there were in Germany 297 periodical publications providing such insurance, of which only slightly more than a half reinsured with regular insurance carriers. In other European countries, such as Norway, Spain and Switzerland, group insurance is used mainly in connection with pension plans; under it pensions are provided to cover old age and invalidity as well as the needs of widows and orphans upon the death of the breadwinner.

GROUSSAC, PAUL (1848-1929), Franco-Argentine historian and critic. Groussac resided in Argentina from his eighteenth year. As director of the National Library from 1885 to 1929 he was able to lead the developing intellect of Argentina toward worthy objectives. His versatile mind was unquestionably the chief influence in bringing the culture of the nation into the stream of modern European intellectual life. The work that he accomplished in this direction is contained in a large journalistic output, in his books and particularly in his reviews, *La biblioteca* (8 vols., Buenos Aires 1896-98) and the *Anales de la biblioteca* (10 vols., Buenos Aires 1900-15). His implacable criticism swept aside improvisation and dilettantism and corrected widely diffused errors in thought; and his painstaking scholarship subjected large sections of Argentine history to revision, opposing the truth, whatever it might be, to patriotic conventions. He cleared up difficulties and threw light upon obscure points. His concept of historiography has been expressed in contradictory forms. In 1907 he held the objects of the writing of history to be scientific, philosophic and aesthetic, involving no contradictions. Accepting Taine as his model he considered that reflection upon history is unnecessary and that the philosophy of history, extensively cultivated in Latin America, is to be found in the narrative itself. In 1916, however, he proclaimed the object of

historiography to be aesthetic, while only its method could be scientific. Thus Groussac differs from the new school of Argentine historians, which follows him in the critical aspects of his work but does not consider the aim of historiography to be primarily literary and which instead of explaining national history largely in terms of personality seeks to find the underlying processes determining events and to place Argentine history in its proper setting in world history.

GRUBER, JOSEF (1865-1925), Czech economist. From 1893 to 1907 Gruber was active in the Prague Chamber of Commerce and Trade and wrote a history of that organization, a work which contains valuable material on the economic history of Bohemia in the second half of the nineteenth century. From 1895 to 1925 he edited the *Obzor národohospodářský* (Economic review). In 1901 he was appointed lecturer and in 1909 professor of political economy at the University of Prague, and from 1907 to 1919 he was general secretary of the Economic Institute of the Czech Academy. After the establishment of the new republic he occupied several official positions and from 1921 to 1922 was minister of social welfare.

Gruber's importance lay in the field of applied economics, where he is to be counted among the liberals, although not of the Manchester school. Thus, while he tried through organized self-help and technical education to save the small entrepreneur in his competition with the large manufacturer, Gruber fought and derided the policy of legal restrictions, such as the certificate of competency, on trade and industry. Moreover, he advocated modern social legislation and during his administration of the Ministry of Social Welfare worked assiduously for the passage of legislation on unemployment relief and other forms of social insurance. He wrote extensively on various economic problems and phases of economic life of his country—the agrarian prob-

lem, population and industrial, commercial and transportation policies.

JOSEF MACEK

GRUEV, DAMIAN (1871-1906), Macedonian revolutionist. Gruev attended the University of Sofia but was expelled because of his socialist activities. He then became a village school teacher in Macedonia, a position which gave him an opportunity to organize secret revolutionary societies in the villages; his opportunities for this work were greatly increased by his appointment as traveling inspector. In 1893, while a member of the faculty of the Bulgarian *gymnasium* in Salonika, Gruev together with his associates federated the local village clubs into the Interior Macedonian Revolutionary Organization, which succeeded in effectively welding together the nationalist groups and in building up a powerful administrative system and a secret militia.

Gruev was the chief organizer and the intellectual leader of the Internal Organization. His keen although limited intellectual qualities and his cold, self-possessed personality made him a powerful influence in shaping its policies. He opposed the pro-Bulgarian movement and helped keep the organization from becoming an instrument of Bulgarian propaganda. He stood above partisan quarrels and although at first a socialist soon realized that Macedonia was not adapted to socialism. During the uprising of 1903 he was elected chief of the general staff in command of military operation. From this time onward he lived as a guerrilla leader in the mountains; when he was killed in a chance skirmish with Turkish soldiers, he was one of the three members of the Central Committee.

ALBERT SONNICHSEN

GRÜN, KARL THEODOR FERDINAND (1817-87), German journalist and philosopher. Grün wrote books on Schiller, Goethe and Feuerbach, histories of sixteenth and seventeenth century culture, a study of contemporary philosophy and two works on social problems. He belonged to the group of young Hegelians converted to socialism by Feuerbach's contention that God is man's projection of himself and that every idea of something transcendental is

an auto-alienation of the human, something which can be reconquered only through a social commonwealth and the medium of love. From religion Grün, like Marx and Engels, passed on to the social problem. Loyal to Feuerbach, he belonged with Hess and Kriege to the school of "true," or "German," socialism.

According to Grün the social problem could be solved by doing with the God of practical life what Feuerbach did with the religious idea of God; namely, by recognizing in private property something which has been alienated from the community. The nature of property, like that of man, is social and cannot be isolated from the social whole. Grün combined Feuerbach's doctrines with those of Proudhon and, finding throughout history a continuous struggle between dominant and oppressed classes, believed that philosophy might ultimately solve the social problem. He thought that by "true" philosophy and religion a truly human existence might be achieved for all in which mass production by machines would operate in a way to satisfy the aesthetic as well as all practical human needs. Because of such illusions the true socialists scorned liberal bourgeois political struggles against absolutism and nationalism and were antagonistic to the development of large scale capitalism, which they regarded as a cause of increased misery. Consequently they were criticized by Marx and Engels, who attacked their basic ideas in the *Deutsche Ideologie*, the *Communist Manifesto* and elsewhere and accused them of lending aid to reactionary feudalism by prescribing as a sufficient remedy for the healing of social ills empty protestations of love instead of the concerted action of a proletariat conscious of its sufferings and needs.

GRUNDTVIG, NICOLAI FREDERIK SEVERIN (1783-1872), Danish churchman, educator, poet, patriot. Grundtvig, the son of a clergyman, was educated for the ministry and

maintained through life an irregular, controversial connection with the Lutheran establishment, eventually becoming titular bishop. He protested in turn against the rationalism and the dogmatic literalism of the church; he demanded a simpler creed, a more abundant life and greater religious freedom for laity and clergy. His governing tenet came to be an insistence upon the "living" word as against the "dead": the Bible in general is a dead word, merely a record of sacred events; the ritual of baptism, including the apostolic confession, and the ritual of the Lord's Supper are the living word, through which Christ still speaks effectually to the church. These views formed the kernel of Grundtvigianism, a liberal movement which has had a considerable influence not only in Denmark but also in other parts of the Scandinavian north and even in America.

Grundtvig believed that church and state alike might best be served by an instructed people. To lessen the cleavage between the classes and the masses he argued for a popular education which should be less intellectual and more practical: less concerned with the dead languages and more with the mother tongue and with history, less dependent upon books and examinations and more upon the living voice of the teacher, less intent upon daily bread and more upon the claims of life as a whole. His ideals are exemplified in numerous folk high schools functioning successfully under state recognition and supervision in the more rural communities of Denmark. Similar schools have taken root in the other Scandinavian countries and to some extent in the United States.

Grundtvig's church was to be a singing church and the school a singing school. He revised older hymns and became popular as a writer of original hymns, secular lyrics and patriotic songs. His pioneering studies in the *Beowulf*, his writings on Norse myth and saga and on the history of his country brought the past into a vitalizing relation with the present. Through all his thought and work ran the aim of making Denmark a unified nation, strong in its sense of historical continuity and confident of its own spiritual resources. His significant influence on the cooperative movement and on the triumph of liberal principles in government has been due not to economic genius or political skill but rather to his singular power as a revivalist patriot. Phases of his literary and nationalistic enterprises were carried forward by his son Svend, the editor of the monumental collection of Danish popular

ballads in which the whole people finds a source of cohesion and inspiration.

GUARANTIES, INTERNATIONAL. International guaranties are agreements between states to maintain specified conditions or rights. Among their objectives has been the preservation of the status quo with respect to boundaries, internal political conditions and the independence of a state or a group of states. In a number of agreements, illustrated by article 10 of the Covenant of the League of Nations and by the treaty of March 26, 1926, between Poland and Rumania, the guaranty clause was intended to prevent disturbances of the status quo through the use of force without prohibiting peaceful adjustments satisfactory to the states immediately concerned. In several recent European alliances mutual assistance has been pledged for all cases of aggression by third states whether the purpose of the aggressor is to disturb the status quo or to achieve other ends. A common objective of guaranties has been to insure the enforcement of treaties either in their entirety or with regard to designated articles. The latter objective was specified in the treaty of January 25, 1924, between France and Czechoslovakia, which arranged for the enforcement of the principles contained in article 88 of the Treaty of St. Germain of September 10, 1919, and in the Protocols of Geneva of October 4, 1922. It is evident that behind the stated objectives of international guaranties there may be a desire to secure the maintenance of peace either by the provision of joint action against an aggressor or by perpetuating a balance of power.

Guaranty pacts may be classified on two main bases. In the first place, they may be either unilateral or mutual in the obligations created. Under the treaty of November 18, 1903, the United States guaranteed the independence of Panama without a reciprocal obligation of a like nature being assumed by the latter signatory. Similarly, two or more nations may undertake to preserve a defined status with respect to

another without reciprocity. By a treaty signed on July 13, 1863, Great Britain, France and Russia pledged their support to maintain the independence of Greece. An example of reciprocal guaranties is provided in article 10 of the Covenant of the League of Nations, by which the "members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all Members of the League." In the second place, guaranty pacts may be classified according to their method of enforcement, which may be either collective or individual or both. Collective guaranties exist only when expressly so stated, with the understanding that in other instances the action defined may be taken separately. While there is no consensus of opinion on the subject, much doubt has been expressed as to the legality of guarantors acting separately where only collective action is called for.

Multipartite agreements defining international guaranties were concluded in considerable numbers before the World War. In addition to treaties providing for the neutralization of designated states, such as Belgium and Switzerland, others were drawn up in order to maintain dynasties and to insure the integrity of countries. Since the World War multipartite guaranty pacts have been given several new applications. The Treaty of Mutual Guarantee, initiated at Locarno on October 16, 1925, is significant for several reasons. The contracting parties, binding themselves collectively and severally to the maintenance of the territorial status quo along the frontier between Germany and Belgium and between Germany and France, included among others the states most advantageously located to threaten that frontier. Moreover, coupled with the pact were agreements creating and defining for Germany on the one side, and France, Belgium, Poland and Czechoslovakia on the other, obligations to use peaceful methods of settling disputes.

Another departure with respect to multipartite guaranty pacts was the role given to the League of Nations as a collective guarantor of international agreements. The Treaty of Versailles of June 28, 1919, placed the constitution of the Free City of Danzig under the guaranty of the League of Nations. Ten minority treaties concluded in 1919-20 between the five principal allied and associated powers on the one hand, and Poland, Czechoslovakia, Yugoslavia, Rumania, Greece, Armenia, Austria, Bulgaria,

Hungary and Turkey on the other, provided for the protection of racial, religious and linguistic groups also under the guaranty of the League of Nations.

The most important undertaking of the League of Nations in the way of guaranties, however, is that provided by article 10 of the Covenant, to which reference has already been made. While there has been no official ruling as to whether the obligation to preserve the territorial integrity of all members of the League against "external aggression" necessitates joint action to prevent the mere invasion of territory, the opinion is widely held that the sanctions of the League should not be applied unless it is evident that the invasion may carry with it annexation. An effort was made in 1923 at the Fourth Assembly of the League to obtain an official interpretation of article 10 which would permit members of the League to decide for themselves to what degree they are bound to insure the execution of the article when requested by the Council. The unanimous vote of the Assembly required for an interpretation of the Covenant was not obtained, but a considerable majority in favor of the proposal indicated that it had wide support.

There are international agreements containing statements of policy with respect to the maintenance of the status quo which should be distinguished from guaranty pacts. In identical notes exchanged between France and Spain and between Great Britain and Spain on May 16, 1907, it was stated that the general policy of those states was to maintain the territorial status quo along the Mediterranean and along that part of the Atlantic Ocean which washes the shores of Africa and Europe, but no commitments for the purpose of enforcing that policy were made. The treaty of December 13, 1921, between the United States, the British Empire, France and Japan did not guarantee the security of the insular possessions of the respective signatories in the Pacific Ocean but merely provided for a conference to consider adjustments in the event that a controversy occurred regarding those areas.

With respect to all international guaranties the problem of effective sanctions has been of great importance. Of the several types of sanctions that have been provided military action has been the most common. Defensive alliances frequently specify this method of action. Other treaties, such as that of November 2, 1907, regarding the integrity of Norway, have stated

more broadly that the guaranty may be effected "by such means as may be deemed the most appropriate." The sanctions of the League available for the enforcement of the guaranties of article 10 include both military action and economic measures. In both instances the League is bound to rely upon the efforts of member states, made at the request of the Council. It is recognized that the application of either sanction must involve a decision as to what state is the aggressor. The practical value of the economic boycott under the League of Nations is questionable because of the harm it may do to the states enforcing it and on account of the ability of more prosperous states to withstand it. An attempt has been made within the League to add to the usefulness of the economic sanction by arranging that positive financial assistance be given to an attacked state. The guaranty of the League of Nations with respect to the constitution of the Free City of Danzig and to the provisions of minority treaties may be made effective through the exercise of certain powers of control that have been delegated to the Council. For instance, this organ acting through a high commissioner deals with disputes arising between Poland and Danzig over the Treaty of Versailles or any arrangement made under it and also hears complaints relating to the operation of the minority treaties.

Finally, it may be noted that public opinion operates as a sanction to obtain compliance with international obligations. While it does not provide a guaranty in the strict sense of the word it is an active force encouraging if not coercing enforcement. There is disagreement as to whether the efforts of public opinion or actual guaranties should receive the greater stress in arrangements for the maintenance of international peace.

GUARDIANSHIP. Under the modern conception guardianship is a trust of a dual nature involving two distinct and separate functions: the control of the person of the ward and the care of his estate. The law of guardianship of infants in the Roman law, the civil law and the common law has developed to some extent along similar lines. In its origin the power of a guardian over a person of tender years was the continuation of a form of family power which can no longer be exercised. At first a profitable right of the guardian, it has in time been converted into a duty to be discharged for the benefit of the ward. The state assumes an ever greater degree of control.

Thus the law of guardianship in Rome grew out of the family organization, and its connection with the law of inheritance was close. From the outset conceptions of property have played a large part in determining its character. The Roman idea of guardianship was originally but an extension of the *patria potestas*, the power of the head of the family over his descendants. It is necessary to distinguish two kinds of guardianship under the Roman law, the *tutela impuberum* and the *cura minorum*. Every person who was *sui juris* and below the age of puberty, that is, fourteen for boys and twelve for girls, had to have a tutor for his or her protection. The essence of *tutela* consisted in the assistance which the tutor had to give to enable juristic acts to be performed. In general the ward had capacity to act with the *auctoritas* of the guardian. There was statutory guardianship, or *tutela legitima*, which under the law of the Twelve Tables devolved on the nearest agnates and, if there were none of these, on the nearest cognates. The persons who would succeed on intestacy to the ward's property became his guardians. Because of the reform in the law of inheritance under the later empire the law of statutory guardianship was changed. Under the law of Justinian it devolved on the nearest cognate capable of serving as guardian. Testamentary guardianship, *tutela testamentaria*, existed where under certain circumstances the paterfamilias excluded the statutory guardianship by testamentary appointment. Limitations were placed on the right of testamentary appointment and in some cases magisterial confirmation was necessary. Magisterial guardianship, or *tutela*

dativa, arose in cases where in default of the above types of guardianship one was appointed by certain Roman magistrates. A special *praetor tutelaris* was established at Rome. Detailed provisions existed as to who could be appointed guardians. Security had to be given for the faithful performance of the duties of a guardian; an inventory had to be made of the property of the ward; the guardian was personally liable for fraud, neglect or waste of the property and he had to render a final accounting of his administration—rules that clearly show that guardianship in Roman law had gradually come to be considered as a public burden or duty. Unless relieved by certain exemptions which were known as *excusationes* no one could refuse to act; in some instances guardians could be removed by the state.

In the theory of the Roman law a person came into the full enjoyment of his personal and proprietary rights on the attainment of puberty. Tutela ended at such an early age in order to allow the establishment of a new patria potestas. *Cura minorum* was established when it was recognized that persons over the age of puberty and below twenty-five needed protection. An early statute allowed such persons to be placed under the temporary control of curators. The effect of the appointment of a curator was to help the minor in the management of his affairs, since he could not alienate property or incur liabilities without the curator's consent. In later times the general tendency was to assimilate the law of tutela and *cura*.

Under the English common law particularly, the theory of guardianship for a long time remained disjointed and incomplete. As Pollock and Maitland have pointed out, the early law knew some ten kinds of guardianship and "yet it never laid down any such rule as that there is or ought to be a guardian for every infant" (vol. ii, p. 444). There was the father's guardianship by nature over the person of his heir apparent and his guardianship by nurture over the person of the younger children. On the death of the father the type of guardianship depended very largely on the nature of the property held by the infant. The law dealt almost exclusively with infant heirs and left other minors to get guardians as best they could—mostly for the purpose of litigation, the so-called guardian *ad litem*. It is clear that the classical common law of guardianship was also an institution existing in regard to the propertied classes. The guardianship in chivalry, originating in the incidents

of the feudal system, had attached to it the important right of wardship and was a source of great profit to the king and the mesne lords. It existed with respect to tenures by knight service and grand serjeanty and gave custody of the ward's person—if a male until twenty-one, and if a female until fourteen—and the right to take the profits of the land, in lieu of the performance of military service. The law looked upon this as a valuable right which could be sold for the profit of the lord. This lasted until the abolition of military tenures after the middle of the seventeenth century. There was also a guardian for the heir under the age of fourteen who inherited land held in socage tenure, and the guardian chosen was the nearest kin to the heir who could not possibly inherit the estate. A statute of the reign of Charles II [12 Car. II, c. 24 (1660)] passed after the abolition of feudal wardship allowed testamentary guardians for minors to be appointed.

In the thirteenth century the idea began to develop, slowly at first, that wardship imposed certain duties. The Statute of Marlborough in 1267 (52 Henry III, c. 17) in effect converted the rights of a guardian in socage into a trust to be exercised for the benefit of the infant. Little was really accomplished, however, because of the many defects of the common law action of account which this statute gave against guardians in socage. The same conception began to appear in certain borough courts at the end of the thirteenth century and much was done therein in the control of guardians. Under the custom of London the mayor and aldermen had guardianship of orphans in the city, and the Court of Orphans which lasted until late in the seventeenth century was the administrative unit with power to take guardianship itself or to commit it to a competent person. There seems to have been some similar provision in the province of York. As time went on the ecclesiastical courts endeavored to enforce as far as possible certain parts of the Roman law about tutela and *cura*, but they could not interfere with the right of wardship.

Pollock and Maitland have suggested that the failure of English law to provide a comprehensive law of guardianship may have been due to the fact that the guardian was not looked upon as a curator, as one "whose consent will enable the infant to do acts which he otherwise could not have done" (vol. ii, p. 445). There was thus no representation of the ward by the guardian, such as existed under the Roman conception of

tutela. The guardian could merely maintain the status quo. He could neither bind the infant nor make it possible for the infant to bind himself, for although the acts of an infant were not void under the common law they were voidable. The common law courts must have relied especially upon this rule because they felt themselves strong enough to protect the rights of infant heirs in the ordinary course of litigation through the device of the guardian *ad litem*.

The king was looked upon as a guardian above all other guardians, but seldom did he assert his authority except when his interests were involved. This theory was, however, to prove of great importance at a later time. Holdsworth has attributed the defectiveness of the English law of guardianship to the fact that it halted between two opinions; the old one, that it was a valuable right existing for the benefit of the guardian; and the newer conception, that it involved responsibilities to the infant. It remained for the chancellor through the exercise of his equitable jurisdiction to give a more modern and adequate conception to the law of guardianship. He began to do so at the end of the seventeenth century after the Court of Wards had been abolished (1660), and he rested the jurisdiction in the supposed revival of the prerogatives of the crown which resulted from the abolition of that court. It was not until equity had dealt with the problem that the equitable conception of trusteeship was extended to the guardian and that he was enabled in any way to supplement the infant's imperfect capacity. Even this was unsatisfactory and statutory aid was necessary to give the guardian sufficient powers. Guardians in Chancery are the most important class of guardians in England today.

At present in the United States the natural guardian of a minor is the father; if he is dead, the mother; if both are dead, the next of kin. This is the equivalent of the old common law guardianship by nature and by nurture. The mother of illegitimate children is their natural guardian, although in this case again the state has done much to guard the interests of the child. The old English statute in regard to testamentary guardians has been reenacted in most of the states. In some an appointment can be made by deed. Guardianship in socage is obsolete at the present day. Courts of chancery, in the absence of statutory limitations, have jurisdiction to appoint guardians; but in most states statutes have delegated the appointment of guardians to probate or surrogate courts, the

most important type of guardianship in the country.

At common law the rights of the father were absolute in regard to guardianship, but equity looked first to the welfare of the child and waived the rights of the father when it was clearly for the interest of the child. The mother, in equity, was regarded as a stranger; but the aim of legislation has been to enlarge her rights in view of the paramount interest in the welfare of the child. Beginning in England in 1839 a series of statutes has gradually increased the rights of the mother in regard to the guardianship of her children. In England by the Guardianship of Infants Act of 1925 the parents were placed on an absolute equality and the welfare of the child was made the primary consideration. Such statutes exist in some American states today.

Frequently, because of the necessity to use the capital of the ward's estate for the education and support of the minor, great pressure had been brought to bear on the common law courts to sell land and apply the proceeds in the interest of the ward. At common law, however, there was no such power, but statutes exist in England and all of the states of the United States allowing such sale on court order; the sale is generally voidable if to the guardian.

In continental countries the state came to be recognized as guardian at the close of the Middle Ages, and the conception was also first effectively realized in the cities. In Germany the idea of the state as guardian in chief was carried to an extreme, the guardianship becoming a mere agent of the Guardian's Board. There was, however, a reaction in the nineteenth century. Because of the very inclusive reception of the later Roman law, guardianship in continental countries has tended to be a unified institute. For various special purposes, however, the Roman law curatorship has been maintained in the guardianship of minors under the leading continental codes. On the whole there has been recognition of the natural rights of the family even where not obligatory. Under both the German and French civil codes the guardianship in default of parental appointment must be offered to one of the grandparents in a certain order of preference.

The control of guardians in continental countries is exercised through various agencies. In Germany the Court of Wards installs even testamentary guardians. Without such installation they have no power and only proper persons will be installed. Every regional unit has a Court of

Wards which in cooperation with the orphans' councils of the communes appoints all guardians and takes children away from improper parents, appointing guardians for them. This court has control of all except illegitimate children, who are taken care of by the Youth Office. In practise the Court of Wards controls the Youth Office. In France the Family Council plays the preponderant role in the exercise of guardianship. It has a part in the selection of the guardian in default of parental appointment or statutory qualification, and the guardian has to secure its consent before he can act in important legal transactions. Since the direct interference of public authority is relatively small in France, the French code has established the institute of supervisory guardianship. An assistant guardian is appointed in addition to the ordinary guardian to oversee the latter and to collaborate with him under certain circumstances. Under a law of 1907 the French tribunals of the first instance supervise the guardianship of illegitimate children. The German civil code has taken over the institute of supervisory guardianship to a limited extent. It has also introduced the Family Council as an optional institute. When the parents prefer, the ordinary functions of the supervisory authorities are taken over by the Family Council.

Most modern states have passed laws relating to the care of dependent and delinquent children. They generally provide for the commitment of such children to persons, societies or institutions where they will receive the proper care. Their object is remedial and they do not attempt to infringe the rights of parents. Under the Children Act of 1908 in England the court may take from the parents and give to an artificial guardian any child who is a victim of maltreatment or whose guardian or parents are convicted of a certain class of felonies.

Thus the modern state has interfered directly to protect the welfare of the child. The child labor laws and the compulsory education laws are but examples of the increasing interest that the state, as the guardian in chief of all minors, is taking in their welfare.

GÜDEMANN, MORITZ (1835-1918), Jewish historian. Güdemann studied for the rabbinate at the Jewish Theological Seminary of Breslau and served congregations in Magdeburg and Vienna. In 1890 he became chief rabbi of Vienna. His religious views were conservative and he strongly opposed the Jewish nationalism of Theodor Herzl.

Güdemann's most important work was in the history of Jewish education, in which he was a pioneer. His *Jüdisches Unterrichtswesen während der spanisch-arabischen Periode* (Vienna 1873) was the first systematic treatment of this subject. His *Geschichte des Erziehungswesens und der Cultur der abendländischen Juden* (3 vols., Vienna 1880-88) deals with French and German Jewry prior to the fourteenth century, the Italian (including Sicilian) Jewry to the Renaissance and German Jewry through the sixteenth century. In 1891 he issued his *Quellenschriften zur Geschichte des Unterrichts und der Erziehung bei den deutschen Juden* (Berlin), a collection of original printed and manuscript documents. Güdemann treated not only educational forms and content but also the social relations of Jews and their Christian neighbors, religious and social customs, superstitions, linguistics and economic life. Although frequently apologetic in tone Güdemann rarely permitted national bias to influence his conclusions. Most instructive are his comparative studies of Jewish and Christian customs and habits of thought. His works have been translated into Hebrew, are still frequently quoted by Jewish scholars and have been the basis of many popular volumes.

GÜELL Y FERRER, JUAN (1800-72), Spanish industrialist and economist. Güell was one of the principal promoters of the Catalonian cotton industry and introduced the manufacture of velveteen into Spain. He was a man of culture and intelligence and became known through his polemical writings in which he attacked the principles of free trade.

About the middle of the nineteenth century liberal theories found a fertile soil in Spain, where they were adopted by outstanding political thinkers. In Catalonia, however, and especially in Barcelona a strong protectionist movement arose because of the fact that industrial development in that region had been founded upon the restrictions of mercantilism. The driving forces behind the movement were the manufacturers' association called the Junta de Fábricas and the Instituto Industrial de Cataluña, both of which followed the leadership of Güell, the "father of Spanish protectionism." Güell was not an economist or scholar in the strict sense of the term; he was rather an indefatigable propagandist and the popularizer of protectionism. Carey, with whom he corresponded, obviously influenced him. He fought to maintain protective measures which contributed to the development of the nation's industries.

In Güell's time Catalanism was not a political but merely a literary and romantic movement, and he believed that neither Cadiz nor Catalonia could achieve a stable prosperity which was not based upon that of the entire country. His program called therefore for equality and likewise for full protection for all social and territorial groups.

ENRIQUE RODRIGUEZ MATA

GUÉRARD, BENJAMIN (1797-1854), French historian. Guérard was student, professor and then director of the École des Chartes and custodian of the manuscripts in the Bibliothèque Nationale in Paris. He prepared for publication several chartularies of primary importance, the famous *Polyptique* of Abbé Irminon (2 vols., Paris 1844) and the *Polyptique de l'abbaye de Saint-Remi de Reims* (Paris 1853). Each of these collections is preceded by extensive and scholarly introductions, or prolegomena, which in

themselves represent the contents of several ordinary volumes.

In these works as well as in his "Explication du capitulaire *De villis*" (in *Bibliothèque de l'École des Chartes*, vol. xiv, 1852-53, p. 201-47, 313-50, 546-72) he laid the foundation for the history of landed property, of rural society and of French agriculture in the Middle Ages. The Carolingian period especially long occupied his attention. He was one of the first to set himself the problem of discovering what regulations of property were in force during this period in Gaul; he was also the first to attempt, by minute study of prices and of the value of money, to establish on a scientific basis the economic history of the Middle Ages, which up to that time had been reduced to crude generalities; he was the first to determine with accuracy the various modes of tenure of rural lands and their methods of cultivation, nor did he omit to study the social conditions of men of all classes who were engaged in improving these lands.

The prefaces to his chartularies extend his analysis of social life, especially rural society, back into the eleventh, twelfth and thirteenth centuries, particularly the life of the serfs and of a class of squatters, the *hôtes*, on whom he was the first to shed some light. He also studied with the same precision the condition of the clergy in the rural districts as well as in the cities and the condition of the lands which were set apart for their support. He contributed finally a host of new details, admirably put together, on the history of the administrative organization of both lay and ecclesiastic domains.

With an amazingly lucid intellect, stating nothing without immediately providing a proof, Guérard was truly an initiator. He was occasionally led on a little too far by excessive logic, but all that he wrote rests upon such firm foundations that even today whoever studies the history of mediaeval society cannot afford to neglect his works.

LOUIS HALPHEN

GUERRAZZI, FRANCESCO DOMENICO (1804-73), Italian nationalist. Guerrazzi, a native Tuscan and from his youth a diligent patriot, was a dominant figure among the more democratic elements engaged in the Risorgi-

mento. The profound and widespread influence exerted by his historical novels in arousing patriotic fervor against foreign oppression established his prestige in nationalist circles and brought him into association with Mazzini. During the insurrections of 1848 he served as leader of the Tuscan democratic movement which sought by popular agitation to force the grand duke of Tuscany both to participate vigorously in the uprisings instigated against Austrian domination in Lombardy-Venetia and to grant a democratic constitution to his subjects. In the early part of 1849, following the flight of the alarmed ruler, Guerrazzi took the helm and inaugurated a thoroughgoing democratic government similar in ideology and in program to those set up by Mazzini in Rome and Manin in Venice. But the growing ascendancy of the democratic forces within the Risorgimento movement was soon halted. The defection of the Tuscan moderates in the crisis brought about by Austria's occupation of Tuscany and the return of the grand duke undermined Guerrazzi's social and political program and thwarted his leadership. His eloquent and able self-defense against the charges brought by the restored grand ducal government was futile, and in the period following his conviction his influence began to wane. Even after the enduring accomplishments of Italian nationalism from 1859 to 1861 Guerrazzi continued to play a secondary role. His intransigence in refusing to compromise with his democratic ideals involved him in a vain policy of opposition to Cavour and to the moderate constitutional party which had risen to power in the new kingdom.

GUERRILLA WARFARE often accompanies struggles for national independence, partisan conflicts in civil wars, peasant revolts, race struggles and the invasion by armed forces of

backward regions. Brigandage, which springs up in response to conquest, weak political control or social injustices and has for its object robbery and plunder, is often a preliminary to guerrilla warfare with a broad program expressed in conscious principles of national independence, class liberty, territorial expansion or race emancipation. Guerrilla warfare is usually resorted to by the weaker side, unable to present organized army opposition, but it may be an adjunct of regular army warfare and under certain conditions guerrilla bands are recognized as legitimate belligerent forces. It is facilitated by extreme climatic conditions; by difficult mountain, swamp, desert or jungle terrain; by a sympathetic populace; by existing lawless conditions; by traditionally low standards of living, especially unsanitary conditions and the prevalence of diseases to which the *guerrilleros* are immune.

Guerrilla warfare was frequent during the Napoleonic wars. The fame of Minas, Empecinado, El Medico and other chiefs who harassed the French in Spain from 1808 to 1812 is perpetuated in popular operettas, or zarzuelas. When the French entered Moscow in 1812 Russian bands under Davidoff (author of the most famous textbook on this method of fighting) and others cut lines of communications, intercepted supplies, annihilated foraging parties and held small detachments close to barracks. Cossack guerrillas pursued Napoleon almost to Paris. The guerrilla operations of Hofer and the Tyrolese assisted materially in forcing Napoleon to evacuate Vienna after the occupations of 1805 and 1809. In 1806 Schill assembled irregular bands to harass Napoleon on his entry into Berlin. The Tugendbund and the Black Brunswickers continued guerrilla fighting until the tide turned against the French in 1813.

During the Franco-Prussian War of 1870 the francs-tireurs maintained guerrilla operations even after the Prussians entered Paris. The Mexicans carried on such activities after the Texans declared their independence and against the Americans during the invasion of 1847. Russian expansion into central Asia faced this sort of resistance constantly and from 1824 to 1859 serious guerrilla warfare raged in the Caucasus.

Wars for national independence have usually begun with guerrilla fighting or have included it as an important adjunct. The fighting of the minutemen of the American Revolution is an

instance. Free lance bands of nationalist Poles opposed Austrians and Russians, particularly in 1831, 1846, 1861 and 1863. Prior to the break up of the Ottoman and Austrian empires guerrilla warfare was almost endemic in the Balkans; the ultimate independence of Greece, Bulgaria, Rumania and Montenegro had been achieved in great part through this sort of fighting. The wars of the Italian Risorgimento likewise involved guerrilla fighting. Irish nationalists have often used guerrilla tactics.

Imperialistic enterprise is almost invariably confronted by guerrilla opposition. Racial and national sentiments are often involved, although in many cases no clear national consciousness has developed. Guerrilla warfare on both sides featured white conquest of the Indians of North and South America and in the Spanish colonial dominions led to consciously nationalist revolts. Spain faced many guerrilla uprisings in Mexico, which were sometimes under Negro slave leaders, had a definite racial basis and carried the slogan of extermination of whites. Generals Campos and Weyler were harried by the guerrilla tactics of Cuban insurgents.

The nomadic Bedouin is particularly given to guerrilla warfare. The French have had to fight repeated battles against the irregular Moslem *harka* of the African desert—in Algeria from 1830 to 1849 and in 1870, in Madagascar from 1884 to 1895, in Tunis from 1880 to 1882, in Morocco from 1892 to 1895, from 1923 to 1927 and in 1929—and against irregular Druse bands in Syria. Spanish and Italian forces have had similar difficulties in Morocco and Eritrea.

British forces in India have often been faced with raids, some of which were more than brigandage and had a definite nationalist tinge, e.g. the Pindari incursions of 1815 which spread over a great part of central India. The outbreak and the end of the Boer War were characterized by guerrilla fighting. The United States confronted the same problem in Aguinaldo's six-year struggle in the Philippines, Peralte's four-year struggle in Haiti and Sandino's three-year struggle in Nicaragua. At the height of Sandino's activities in 1928 he kept more than 5000 marines engaged.

Guerrilla fighting frequently appears in civil conflicts, as under Stuart, Forrest, Morgan, Mosby and Stoneman in the American Civil War. Huguenot bands harried the Cavaliers in the Cevennes, Catholic and loyalist elements conducted serious guerrilla fighting in Vendée

against the French Republic in 1793, the Francini and Trencks were famous in the time of Frederick the Great and many of the heroes of the Thirty Years' War (the Duke of Brandenburg, Prince Christian, Count Mansfeld and others) were little more than persistent *guerrilleros*. Carlists kept up an irregular insurgency in Spain from 1830 to 1840 and from 1872 to 1876. The fighting in many sectors of the Russian front after the Bolshevik Revolution of 1917 was conducted along guerrilla lines by both sides. Nearly all Latin American revolutions are featured by guerrilla fighting.

Peasant uprisings are frequently attended by such tactics. The peasant knows the countryside and its trails; he can readily return to his farm when things go wrong; he counts on widespread sympathy. The nationalist peasant revolutionists of Catalonia during the eighteenth century and both Catholic and peasant revolutionists in Mexico in recent years resorted to guerrilla warfare. The maraudings of Pancho Villa in the north and the *Zapatista* movement in the south of Mexico were largely conducted along such lines, although Emiliano Zapata entered Mexico City in 1914 with what was virtually an army. The centuries old Yaqui struggles in Sonora, the war of the castes in Yucatan during the middle of the nineteenth century and many eruptions in Nicaragua, Bolivia, Peru and Brazil, colored by racial antagonism, have been guerrilla in form.

Where such guerrilla revolts occur in imperial key centers, as in north Africa, the whole international balance of power may be affected. French and English operations in north Africa frequently aroused alarm in Italy and Germany. The Agadir incident was a forerunner of the World War; guerrilla operations in the Balkans, abetted on the one hand by Austria, on the other by Russia and elsewhere by Turks, prepared the way for armed conflicts on a more grandiose scale. After the World War Poles in the Ukraine, Rumanians in Bessarabia, Italians in Fiume, Young Turks in Asia Minor and similar guerrilla groups were important in revising national boundaries.

Various technical treatises have been written on the science of guerrilla warfare. The general conditions for successful operations which have been laid down are: an unassailable base (as in the cases of General Allenby in the Red Sea ports and Sandino in Nicaragua, with a back door in Honduras), a friendly population, a conventionally trained alien enemy too small

in force to dominate all areas from fortified points, the ability to be independent of ordinary arteries of supply, speed of movement, power of endurance and the possibility of frequently attacking small enemy detachments.

Thus the civilian populations often suffer more heavily than in regular organized army operations. *Guerrilleros* raid unprotected centers and the enemy severely represses pacific populations to counteract hostility. The German invaders of France in August, 1870, ordered the death penalty for all francs-tireurs and those who might aid them. Communes assisting the irregulars were to be fined an amount equal to their annual taxes. To put down the Catholic revolt in Jalisco from 1926 to 1929 the Mexican federal forces declared one third of that state a combat zone and all inhabitants who did not evacuate to be rebels.

The Brussels International Conference of 1874 attempted to lay down rules for irregular combatants. Irregular bands to enjoy belligerent status must be headed by a person responsible for his subordinates; all members must wear some distinctive emblem recognizable at a distance; they must carry arms openly and conform to the laws and customs of war. Although transcribed into the Russian army regulations during the war of 1877-78 these rules were not adopted until the Hague Conference in 1899. They were reaffirmed in 1907. Belligerents also include those who rise voluntarily at the moment of foreign invasion, although they may not have had time to become organized in the manner just described. These rules have been observed in cases of bands connected with regular army operations but have rarely been followed during invasions of colonial countries. Although Sandino in Nicaragua complied with them, the American forces classed him technically as a bandit.

With the invention of airplanes, light field artillery, machine guns and poison gas it is easier to cope with guerrilla activities than formerly. It is more difficult for armed bands to conceal themselves and their operations; they can be more swiftly attacked once they have been localized. On the other hand, since guerrilla operations now attract more general attention as a result of improved international communications, foreign opinion is brought more quickly to bear on cases where civil or international injustices have resulted in armed revolt. National and racial aspirations are better known to the world. Sandino's activities had more publicity value than actual military importance,

although a few years earlier Peralte's more prolonged resistance in Haiti attracted little attention. Colonial guerrilla warfare often prepares sentiment over large areas, as evidenced by the naming of public streets throughout Latin America after Sandino and the stirring of Moslem hosts from the Wad Draa to the Philippines as a result of the activities of the Riff guerrillas. The development of modern proletarian and liberal movements on a wide international scale provides a large audience ready to make foreign racial and anti-imperialist causes its own.

GUESDE, JULES (Jules Basile) (1845-1922), French socialist. Guesde was born in Paris, the son of a boarding school master. As editor of the republican *Droits de l'homme* he was condemned to six months' imprisonment at the end of the Second Empire. He embraced the cause of the Commune and when it fell became an expatriate. In Switzerland he joined the anti-Marxist Fédération Jurassienne. He returned to France

in 1876, founded *Égalité*, a collectivist organ, and in 1878 was again condemned to six months in prison. Meanwhile he had shifted toward Marx' ideas and after the Congress of Marseille, which marked the triumph of collectivism, he founded the *Parti ouvrier* with a Marxist program and became with Lafargue and Deville the popularizer of Marxist doctrines in France. He published pamphlets, lectured throughout France and in 1893 became a deputy, retaining a seat until 1921. He attacked anarchism, possibilism and insurrectional Hervéism. In 1898 he opposed Jaurès, whom he reproached for associating himself with liberal intellectuals in the Dreyfus affair. Later he denounced Millerand's participation in the Waldeck-Rousseau cabinet of 1899 and defended his stand at national and international socialist conventions. After triumphing over Jaurès at the Amsterdam International Socialist Congress in 1904, Guesde led in creating the unified *Parti socialiste* in 1905.

Guesde considered the principle of the class struggle predominant throughout history; the proletariat is exploited by industry as the slave was by his master and the serf by his lord. Large scale industry increases the number of workers, who, like the bourgeoisie before them, should organize to bring about their revolution. The revolution would be accomplished not by parliamentary means (which, however, should be used for educational ends) but through mass action. The proletariat should demand reforms but should not expect them to lead to freedom, which, like the abolition of war, can come only after the destruction of capitalism. Collectivism is the first stage of socialism. For the ultimate establishment of collective property the proletariat must acquire power. It must refuse all collaboration with the propertied class and hence must take no part in the administration of the bourgeois regime. Guesde explained his participation from 1914 to 1916 in the *Union sacrée* cabinet, formed to conduct the war, on the ground that the circumstances were exceptional.

GUGGENHEIM FAMILY, American industrialists. The Guggenheim name is the principal one associated with mining and metallurgical enterprise on a world wide scale. The founder of the business dynasty, Meyer Guggenheim (1828-1905), was a Swiss-Jewish immigrant who came penniless to the United States and amassed a fortune in the best manner of the American success saga. In his fifties, after he had built up a substantial Philadelphia establishment importing Swiss embroideries he turned, largely through accident, to mining. But finding it unstabilized in its operations and risky in its returns he transferred his attention and eventually all his capital to smelting, which he felt could be reduced to systematic processing and could be made to yield steady profits. He established smelters not only in Colorado but also in Mexico where they would be readily accessible to Mexican silver-lead ore without the heavy burden of freight charges, and he established a refinery in New Jersey. In the entire process of building up his business power one of his principal resources lay in the possession of seven sons whom he trained in business strategy and through whom he retained a degree of control over his far flung enterprises that was impossible for most firms operating on the same scale. When the metallurgical industries were caught up in the consolidation movement of the nineties and the American Smelting and Refining "trust" was in process of formation (1899), the Guggenheims made control a condition of their adherence, and when that was refused they remained outside the trust as its chief competitor. The struggle that followed was fiercely and, at least on the part of the Guggenheims, brilliantly conducted. In the end the trust capitulated (1901) and a reorganization was effected that gave the Guggenheims control. Daniel Guggenheim (1856-1930) became chairman of the executive committee and Isaac Guggenheim (1854-1922) a member; five Guggenheims sat on the board of directors.

The enlarged scope of their operations gave the Guggenheims a chance to develop a complex but well articulated business policy which effected little short of a revolution in the industry. One phase of this policy was the integration

of the mining with the processing of metals under a single control. In the battle with the early trust the Guggenheims had been forced to reverse Meyer Guggenheim's original intention to stay clear of mining. To obtain control of a steady supply of ore for their smelting processes they had not only made financial alliances with mine owners but had formed a separate organization, the Guggenheim Exploration Company, mobile and flexible in its operations, and combining engineering with promoting functions. The reorganized American Smelting and Refining Company pursued this tendency farther. A number of affiliates were created which clustered about the central enterprise. Through them the various steps from the exploration of ore to the marketing of the finished product were integrated under a masterly if somewhat tortuous and baffling organization. The scheme combined operating autonomy with centralized financial control. Another phase of the policy was a decisiveness of operation and a grandeur of scale new in mining. Once a decision was made to exploit an ore field the proceedings moved rapidly and huge sums were spent in engineering construction. The Guggenheim exploits in the copper fields of Alaska and Chile stand out in engineering history. No less ingenious and magnificent were their feats of financial reorganization of enterprises the world over. But the most important phase of the Guggenheim plan was the way in which, through technological overhauling and the introduction of machine methods, they stabilized the processes of production and often reduced the margin of ore content that could profitably be mined.

In the three decades since the merger the Guggenheims have girdled the globe with an imperial organization of possessions, dependencies and protectorates over mines and mining operations. Their extensive properties in Mexico, Alaska, Bolivia, Chile, Angola and the Belgian Congo have given them an industrial power which has carried with it a degree of control not only over the economic prosperity but often over the political fortunes of those regions. Aside from their economic importance in their own country they have played an extensive part in the life of the nation. Meyer Guggenheim set his sons an example of philanthropic activity which they have consistently followed. At times they participated in politics, Simon Guggenheim (1867-) having been senator from Colorado. Their labor policy, in the main an unimpassioned welfare capitalism, has been more a matter of

avowal than of fact. Evidence before the United States Commission on Industrial Relations in 1915 showed important discrepancies between Daniel Guggenheim's credo and his actual policy. But the family has shown an unflagging public spirit in the promotion of such matters as aviation, band concerts and fellowships for study abroad.

GUICCIARDINI, FRANCESCO (1483-1540), Italian statesman and historian. A student of jurisprudence and a practising lawyer in his youth, Guicciardini began his political career in 1512 as a diplomatic representative from his native city, Florence, to the Spanish court. He occupied various responsible offices in the city magistracy and in 1516 entered the papal service as governor of Modena. In 1521 he was promoted to the post of commissary of the papal army, in 1524 to the presidency of Romagna. But after his disastrous failure as lieutenant general of the papal and Florentine troops in the war following the formation of the League of Cognac, his fortunes were eclipsed. Thereafter, while vainly attempting to regain political favor, he devoted his time to the composition of his major works.

His writings fall into two distinct although related groups, political and historical. The political writings, to which belong *Discorsi politici* (begun during his Spanish legation and continued throughout his active career), *Del reggimento di Firenze* (written between 1521 and 1526), *Considerazioni sui discorsi del Machiavelli* (written in 1529) and the collection of maxims entitled *Ricordi politici e civili* (written toward the end of his life), represent a modified form of Machiavellianism. He tempered Machiavellianism by a scrupulous adherence to the empirical method, a distrust of abstraction; he heightened it by a consistently realistic or cynical point of view, which contrasts with his predecessor's propensity to irradiate egoism with the light of loftier ideals. Guicciardini had no hesitation in con-

fessing that although he detested priests and was inclined to "love Luther as he loved himself" he nevertheless slaved for the popes to serve his private interests. His typical statesman, whom he conceived in his own image, may be looked upon as a product of the moral decadence and utilitarian spirit prevalent in an Italy which had abandoned all hope of regaining its ancient autonomy. The callousness with which his writings, particularly the maxims, dissect the psychological motives underlying political actions is matched only by their lucidity. What elements of idealism exist in Guicciardini take the form of a nostalgia inspired by the vestiges of ancient republican customs and the literature of Greece and Rome. But his dream of an ideal government, which he views as a composite of the monarchical, aristocratic and democratic forms, never intrudes upon his analysis of actual conditions.

As a historian Guicciardini wrote in his youth *Storia fiorentina*, treating the period from 1378 to 1509, and in his maturity *Storia d'Italia*, which begins with 1492, where Machiavelli's history breaks off, and concludes with the death of Clement VII in 1534. The supreme monument of sixteenth century Italian historiography, the *Storia d'Italia* fulfils Montaigne's wish that history be written not by litterateurs but by statesmen who have directly or indirectly participated in the events they narrate. With this qualification Guicciardini combines a freedom from partisanship and apologetic intent. In fundamental conception the work is entirely analytical and genetic despite its external chronological form. Its limitations are those of Guicciardini's interests as well as of all historiography of the time. *Storia d'Italia* is, in modern terms, a diplomatic history confined to a study of the intricate relations between the various powers, particularly France and Spain, who in Guicciardini's time were struggling for European hegemony on Italian soil. Concerning the life of the people and all questions of social, religious and moral conditions it maintains unbroken silence.

GUIDO DE RUGGIERO

Works: The first sixteen books of *Storia d'Italia* were first published at Florence in 1561; the last four, edited from the author's notes by his nephew, were published at Venice in 1564. The best modern edition of the whole work is that by C. Panigada, 5 vols. (Bari 1929). The other works mentioned in the text remained unpublished until the Canestrini edition of the *Opere inedite*, 10 vols. (Florence 1857-67).

GUILD SOCIALISM is that form of socialism which laid stress on the importance of industrial self-government and functional democracy. Agreeing with other schools of socialists that the means of production ought to be communally owned, the guild socialists favored workers' control as opposed to state management of industry. They contended that the administration of socialized industries and services should be entrusted not to government departments but to self-governing guilds or corporations consisting of all the hand and brain workers employed in each industry. They sought to realize this idea by influencing and strengthening the trade unions in the hope that largely from them might arise the guilds which they desired. They were not hostile to the political activities of labor and socialist parties but believed that economic power precedes and dominates political power and that the decisive battles of the working class can be won only in the industrial field. Parliamentary democracy they held to be a sham as long as great economic inequalities continue to exist. They repudiated for the most part the doctrine of state sovereignty, setting in its place a political pluralism which splits up ultimate authority in the community among several functional bodies.

In economic theory guild socialism was predominantly Marxist. Many of its advocates laid stress on the class struggle and put the abolition of the wage system in the forefront of their policy. They observed the concentration of capital in the hands of large corporations and set out to create new instruments for the control of industry on the basis of the working class movement. They insisted that the emancipation of the workers could be achieved only by the workers themselves and adopted the Marxist view of the state—that it is, in effect, the executive of the capitalist class. There were always among the guild socialists some who were not Marxians in this sense, including a small band of mediaevalists and Anglo-Catholics who stressed rather

the artistic and ethical implications of the guild doctrine. The writings of the guild socialists are Marxist in tone; in their propaganda, however, they stressed chiefly not this Marxist basis but their special interpretation of it in terms of functional self-government and of workers' control of industry, which they held could begin to be effected under capitalism and would serve as a gradual transition to a socialist society. Guild socialists differed about the state, some holding that it could be so reformed as to serve as a useful coordinating instrument in a guild society, while others held that the state as it is at present would disappear and its place be taken by a connected group of functional organizations representing producers and consumers.

The guild movement passed through several phases. From 1906 to 1912 what was originally a craftsmen's demand for the restoration of the mediaeval guild system developed into a demand for the creation of national guilds for the control of modern large scale industry. The protagonist of the early guild doctrine was the architect and former Fabian, A. J. Penty. He was supported by A. R. Orage, also a former Fabian, who became editor of the *New Age* in 1907. In his first book, *The Restoration of the Gild System* (London 1906), Penty attacked the dominant socialist doctrine of collectivism and called for the restoration of craftsmanship and industrial self-government through a revived system of guilds. According to Penty and Orage the evils of modern society arose mainly out of the domination of the financial powers over the actual producer, with results disastrous for the quality of work and life. Their hopes in regulating the control of industry were already based on the growing power of the trade unions, which were regarded as the potential instruments of a coming system of guild control. The mediaevalist associations of the movement were strongly marked, as in the spelling of gild, which later became guild.

Orage with the collaboration of S. G. Hobson reformulated guild doctrine between 1912 and 1915 in the columns of the *New Age*. *National Guilds*, originally published in the *New Age* during 1912 and 1913, was the first systematic exposition of the new guild doctrine. The mediaevalist implications fell into the background; and partly under the influence of syndicalist and industrial unionist doctrines, then only becoming known in Great Britain, the guild movement began to appeal more and more directly to the trade unions, urging them to adopt an advanced industrial policy for the securing of

workers' control in industry. These were years of widespread disappointment over the tactics of the Labour party, which after the general elections of 1910 subordinated its own plans to the immediate task of keeping the Liberal government in office. They were also years of rising prices and, on the whole, falling real wages, which led to the great outburst of strikes and industrial unrest in the period immediately before the World War. Guild socialism thrived on these conditions, insisting that parliamentary action by itself was futile and allying itself with the new militant tendencies in the trade union movement.

It was not until 1915 that the guild movement assumed an organized form. In that year the present writer, who had become a convert to guild socialism some time earlier, joined a group, including most of the original guildsmen, which founded the National Guilds League as a propagandist body. The league was always small: even at the height of its influence it had not many more than five hundred members; but these included a considerable number of effective writers and speakers such as R. H. Tawney, Bertrand Russell, H. N. Brailsford, Maurice Reckitt, J. L. Hammond, Frank Hodges, George Lansbury and Lord Justice Slesser. It issued a stream of pamphlets of high literary quality and followed these with a monthly paper, the *Guildsman* (later the *Guild Socialist*). The members were active in writing books expounding guild doctrines and in contributing articles to newspapers and magazines as well as in providing speakers for labor organizations all over the country and skilled craftsmen for trade unions or other bodies which wanted their policies set forth in clear and cogent language. This last activity especially enabled them to wield an influence on the trade union movement quite out of proportion to their numbers. The new policies of socialization with workers' control adopted by many leading trade unions during and after the war were produced partly under guild socialist inspiration and with the help of leading guild socialists. Moreover, the conditions of industry in the war period seemed to make the guild doctrine highly appropriate. Shortage of man power greatly strengthened the trade unions; and wartime conditions of production caused constant friction in the workshops and led to a demand for workers' control. The guild socialists were able for the time to ride on the wave of this demand and their propaganda had wide appeal. Although no definite organization was effected outside of

Great Britain, except for a small branch in New Zealand, the propagandist literature issued by the league was translated and books were written on guild socialism in many languages.

In 1920 throughout Great Britain a number of building guilds were created, which entered into ambitious contracts for housebuilding under the government housing scheme. S. G. Hobson and Malcolm Sparkes were mainly responsible for drawing the building trade unions into this important venture. The government, which had in effect advanced the capital for the scheme, modified the conditions of its housing program in 1921 and 1922, compelling the guilds to find their own capital and credit. Unable to do this, the guilds attempted recklessly to carry on without the necessary resources and were brought to the ground. The National Building Guild, which had absorbed most of the local bodies, went bankrupt and only a few small guilds survived.

While the building guild movement lasted it greatly increased the influence of guild propaganda. Many trade unions linked up with the movement and were federated in a body called the National Guild Council, which was formed early in 1922 as an auxiliary to the National Guilds League. Small guilds were formed in a few industries besides building, including tailoring, men's furnishing and pianoforte making, some still surviving. But when the National Building Guild collapsed it dragged down the guild movement with it. The National Guild Council soon ceased to function as a separate body and a little later in 1925 the National Guilds League, with which it had been amalgamated, suspended operations and was dissolved.

Other factors besides the fall of the building guilds contributed to this collapse. For some time pronounced differences had been evident among the leaders of the movement. These first became serious after the Russian Revolution, which, welcomed by the majority, was strongly disapproved by a minority of guild socialists.

This difference did not cause a split; but soon afterward strong dissensions arose out of the currency theories of Major C. H. Douglas, who enunciated a "social credit" scheme designed to increase the volume of currency and to reduce the level of prices. The doctrine secured the support of Orage and of the *New Age* but was rejected by the majority of guild socialists. Although no actual split occurred, the guild propaganda became more diffused and contradictory and far less effective and the leaders were not wholly sorry when the fall of the building guilds afforded a good reason for bringing the organized life of the movement to an end.

Since the collapse of the National Guilds League there has been no guild socialist movement. But many of the ideas for which the guild socialists contended have been incorporated into British socialist thought and policy. Sidney and Beatrice Webb, for example, show the influence of these ideas in their book *A Constitution for the Socialist Commonwealth of Great Britain* (London 1920). Socialist ideas of nationalization have been profoundly modified, and it is now generally believed among socialists in Great Britain that socialized industries and services must be largely self-governing with an increasing measure of control allotted to the workers. The old notions of state sovereignty have also been amended and the idea of functional democracy commands a measure of support.

IN ANTIQUITY. *Ancient Mesopotamia and Pharaonic Egypt.* Specific information is yet to be found concerning the consolidation of trade and

craft into forms of organization transcending that of professional heredity within the family, either in Babylonia and Assyria or in pre-Hel-

lenistic Egypt. It is very doubtful whether the frequent mention in documents and monuments of "superintendents, secretaries" or "clerks" of goldsmiths, carpenters, masons, weavers, fishers, bakers and similar crafts really indicates the existence of associations formed on an autonomous basis. As would be true in the case of ordinary workmen these inscriptions may refer only to a bureaucratic organization of the artisans employed in state enterprises. Likewise the naming of city streets and squares after various trade branches and crafts does not in itself prove anything beyond the mere fact that a group of people engaged in the same profession had actually settled down in a certain neighborhood. It seems somewhat more likely that there existed at one time or another, at least in Babylonia and Assyria, merchants' associations of a local nature which performed certain administrative functions. There is no evidence, however, of any craft organization even in periods which were as highly developed economically as those of Chaldean and Persian rule. These negative findings are of importance to the problem of the origin of the very numerous guilds found on the soil of the ancient kingdoms during the Hellenistic period.

Greece. Associations of traders and craftsmen may have been known in Greece quite early, for even the so-called law of Solon mentions along with religious and industrial organizations those of the *emporoi*, or traders. Documentary evidence, however, of the existence of corporations of *emporoi* and *naukleroi*, or shipowners, in Athens and Piræus is not available for a period earlier than the end of the fifth century B.C. Not until the subsequent Hellenistic period does this evidence become more abundant on the mainland as well as on the islands and refer to the organization not only of merchants, shipowners and navigators but also of artisans and craftsmen in definite unions, more and more clearly differentiated according to profession. The basis in Greece for such organizations may have been on the one hand common professional interest and on the other religious and other motives. The religious and occasionally also the artistic and social character of these guilds is clearly visible in their external forms as well as in their internal structure. Thus the Greek guilds became an important factor not only in the economic but also in the social and cultural life of the time; and they further joined with other types of association in the pursuit of surreptitious political aims.

In the founding of professional corporations the principle of freedom of association was adhered to in countries where the Greek law prevailed. The concession system and the state confirmation of guild status were Roman innovations which took root only in later centuries. The organs of guild government were everywhere membership meetings and elected officers. The jurisdiction of each was, as with other types of association, clearly defined; and in accordance with the democratic principle the plenary session of the assembly had the final authority. It drew up the statutes, decided on the admission and expulsion of members, determined the ways and means for the attainment of economic and social aims, regulated the acceptance and distribution of work and exercised judicial functions. The growth of state influence at a later period was accompanied by an increase in the executive power of the officers (board of directors) and the gradual pushing into the background of the functions of the assembly.

Egypt and Western Asia in the Hellenistic Period. Extraordinary guild activity is one of the characteristic features of Hellenism; the same impulse finds expression also in the extensive organization of commerce, trade and industry. There exists especially full information about this period in the Greek papyri dealing with conditions in Egypt; inscriptions from Asia Minor and other countries on the eastern Mediterranean are also quite profuse. On the other hand, literary evidence unfortunately is very scarce and thus very little is known about the economic significance of the Hellenistic guilds, their influence on trade and industrial production or their share in the development of those institutions of commercial and naval law which through the mediation of Rome played so important a part in world commerce until far into the Middle Ages.

In Egypt even in the Ptolemaic period a distinction must be made between the autonomous associations of craftsmen and traders, which doubtless can be traced back to their Greek root, and those associations (of crown peasants, transporters, certain branches of stock breeders and stonecutters) which from the very beginning bore the earmarks of semigovernmental organizations, and which can perhaps in part be traced back to autochthonic public economic institutions. Both in Egypt and outside it the free corporations of the various professions were organized chiefly according to localities and cities; larger unions, except those of merchants which

often covered whole districts, were less frequent. Occasionally evidence of women guild members is found; foreigners, however, were admitted only to merchants' associations.

Roman rule was responsible in all the Mediterranean countries (Greece, Egypt, Mesopotamia, Asia Minor and so on) for an increase in the number of guilds and also for further specialization of production and division of labor. The common Greek basis in the organization of professional corporations does not, however, seem to have been affected to any appreciable extent by Roman influence during the first centuries of the empire. But during the Byzantine period, with the growing influence of the state, far reaching changes become apparent everywhere. It is impossible, for instance, to discover even in Egypt any continuity between the Ptolemaic semistate associations of certain professions and the Byzantine compulsory unions.

Rome. Professional corporations in Rome are not so ancient as would be indicated by the legend which ascribes the creation of *collegia opificum* to King Numa or Servius Tullius. The separation of the crafts from home industry came about gradually and at a later time. It is doubtful whether there were many guilds in existence in Rome prior to the Second Punic War; indeed even for the period of the later republic available material is still very scant. Not until the imperial period is there evidence of the existence of a great number of *collegia opificum* (*fabrorum, centonariorum, dendrophorum, artificum, mercatorum* and *negotiatorum* throughout the empire. In general these *collegia* were organized very much like municipal communities (*municipia*) and therefore had frequently to adjust themselves to the fundamental changes in the organization of these latter which took place in the third century A.D. The organic basis of Roman guilds was a statute, *lex collegii*; in many instances the authority was centered for the most part in the *magistri, quinquennales* and the like, who were heading the guilds in the capacity of officers.

In Rome as elsewhere the relationship of the guilds to the state probably developed out of the principle of free association. Occasional interference on the part of the state during times of political unrest led under the principate to the concession system, which, however, was not applied consistently to the guilds. The granting of a concession per se does not seem to have vested the *collegium* with the rights of a juristic person (*corpus*).

The Romans with their genius for statecraft succeeded relatively early in enlisting the professional corporations in public services. As early as the end of the republic a close alliance is found between the *collegia fabrorum* and the municipal fire department. During the empire a similar tendency was manifested regarding the various professions providing the capital with food supplies from the provinces (*annona*). At first the responsibility for such undertakings rested on individual members of the guilds, who in return received various privileges from the government. The number of such individuals grew constantly; state service did not, however, exclude them from the conduct of private business. As early as the beginning of the third century A.D. there were certain *collegia* (*navicularii, frumentarii, boarii, pistorum* and so on), whose members were nearly all actively engaged in government service. Obligations and privileges were now being transferred from individual members to their guilds. Here too the example of the municipal curiae was being followed, thus paving the way for the compulsory unions of the absolute monarchy.

During the Byzantine period the increasing and widespread subjection of industry to state control, the far reaching monopolization of trade and labor, the drafting of whole corporations as such rather than individual members for the performance of governmental tasks, gradually brought all organizations into the exclusive service of the state government. Thus the process of stagnation by which the guilds were converted into compulsory associations (*corpora, systemata*), already well under way in both the eastern and the western empire, was soon completed.

It is still an open question whether a bridge can be found linking the last compulsory associations of the Roman Empire to the mediaeval guilds of western Europe. So far as Germany is concerned there is probably no such link. With regard to Italy, however, where the existence of guilds even under the Teutonic rulers can be proved, at least a limited continuity should not be denied.

MARIANO SAN NICOLÒ

LATE ROMAN AND BYZANTINE. The opening of the fourth century A.D. brought with it the culmination of the process whereby the professional guilds of the Roman Empire were transformed from voluntary associations formed with governmental approval and encouragement into com-

pulsory public service corporations entirely controlled by the state. The members of the guilds thus came to constitute one of the hereditary castes into which the population of the empire was divided.

The guilds of Rome and Constantinople were called *corpora*, those in the provincial municipalities *collegia*. Their members were respectively *corporati* or *collegiati*. Practically all persons throughout the empire who were engaged in trade or commerce or who practised the various arts and crafts, apart from agriculture, were enrolled under compulsion in guilds corresponding to their occupations. The most important of these guilds were those which were concerned with the annona, or public distribution of food to the populace of Rome and Constantinople. In contrast with these, which engaged in business on a large scale and occupied a position of some social distinction, were the guilds of the laboring classes and at the bottom of the social scale those of the charioteers and actors. An important group of guilds was formed by the employees of the imperial mints, factories, mines and other industries. There is less information on the guilds of the municipalities than on those of the two imperial cities; but the general situation was similar, although the local associations were necessarily both fewer and smaller. Particularly prominent among them were the guilds which constituted the local fire brigades, the builders, woodcutters and rug makers.

The ultimate control over the guilds rested with the emperor, and imperial edicts regulated both the general status of these associations and the details of their internal organization. In Rome and Constantinople the city prefect exercised direct supervision over the guilds, watching over the performance of their public services and having authority to punish them for disobedience or neglect of duty. Throughout the provinces the guilds which ministered to the annona were under the control of the praetorian prefects, who acted through their subordinates, the vicars of the dioceses and the governors of the provinces. The municipal guilds carried on their public duties under the direction of the local councilors, the *curiales*, but administratively were subject to the *defensores civitatis*, who as representatives of the central government were subordinate to the provincial governors.

In order to maintain the numerical strength of the guilds at a level equal to the demands of the public services, the state rigidly applied to the *corporati* the doctrine of the *origo*, whereby

persons of all classes were compelled to meet their obligations to the state in the place of their birth. For the *corporatus* the guild was the *origo*, and the children of *corporati* had to enter the guild to which their parents belonged. Even if only one parent was a member of a guild, the children were still required to become *corporati*, assuming active membership on the attainment of their majority. For this reason intermarriage between members of different guilds was definitely restricted. As a result of these regulations the personnel of the guilds came to be composed primarily of the descendants of former members. Women as well as men were considered as belonging to the guilds even where they could not personally carry on the professional duties of the members. Other sources of membership were election by the guilds themselves of persons approved by the state officials, assignment to the guilds of suitable persons and in extreme cases judicial condemnation of individuals to specific guilds. The qualifications of new members included proper age and freedom from obligation to other public services. The names of all members were entered on a list called an album, copies of which were in the offices of the proper public officials. Slaves were not eligible to membership, although a guild might itself own slaves. Once a person was enrolled in a guild it was exceedingly hard for him to secure a discharge from it. Satisfactory tenure of all the guild offices, entrance into the ranks of the clergy with cession of property and special action by the emperor himself were the chief ways of obtaining relief. The *collegiati* were required to reside in respective towns, and anyone who tried to escape from his obligations was reclaimed by the guild with the aid of the public authority. Only those who escaped detection for fifty years were considered to have acquired immunity. In spite of these restrictions the members of the guilds ranked as free persons, legally competent in all private relations.

The public obligation for which each guild was liable rested upon the guild as a whole but was apportioned among the members according to their means. This burden was a *munus mixtum*; that is, it fell upon both the individual and his property. Hence no *corporatus* could withdraw his property from the public service. This liability passed with the property from one owner to another and any outsider who acquired liable property was required to join the appropriate guild.

The internal administration of the guilds is

not very well known but was under the close supervision of the state. Each guild had an assembly which assigned the public duties to the various members but was itself responsible for their performance. The guilds were juristic persons, possessing property which they used for the performance of their public duties and having a claim to inherit a share of the property of members who died intestate.

In return for their public services the state conferred upon the guilds certain privileges. In general they were exempt from extraordinary and degrading services, from undertaking the guardianship of children of outsiders, from military service, from municipal obligations and from the trade tax. Pecuniary compensation was given by the state in some cases, but this was not so much payment for services as reimbursement for expenses or losses incurred in carrying out specific tasks. The shipowners were honored with admission to equestrian rank and the officials of other guilds were likewise granted special titles of rank or other advantages. Since the guild members were allowed to ply their trades as best they might for their own private gain subject to the fulfilment of their public duties, the virtual monopolies of their respective occupations which they enjoyed were greatly to their advantage. No one could be a member of two trade guilds; secrets were therefore preserved and proficiency in the various crafts encouraged. Nothing is known, however, of the methods of training employed.

Under the crushing burden of the state's demands the guilds were reduced to a very precarious condition by the middle of the fifth century. The flight of the *corporati* could not be checked and the guilds were held together only by most stringent measures on the part of the emperors, who resorted to obligatory enrolment, the amalgamation of different guilds and similar drastic steps. These efforts, however, proved vain and the majority of the guilds in the west disappeared with the barbarian conquest. A few remained in Italy under the Ostrogoths and there is evidence of an isolated guild at Ravenna as late as the tenth century.

In the east the guild system survived but practically nothing is known about it from the time of Justinian to the tenth century. In Constantinople at the latter date dealers in all food-stuffs, merchants and manufacturers of silk and linen and such others as had important public services to perform were organized into guilds whose names show that they were the direct

descendants of the guilds of earlier date. It is uncertain, however, whether all trades and professions still had a similar organization. The guilds were under the strict control of the state, represented by the *praefectus urbi*. His approval was necessary for the election of new members and the appointment of guild officers. He controlled the private and public activities of the guilds in the interests of the state and the populace of Constantinople, fixing prices, profits and conditions of trade. But some important changes had come about. The guilds were no longer hereditary groups, the property of members was no longer bound to public service, enrolment was entirely voluntary and the obligations of the *annona* had vanished with its abolition. The fate of the Byzantine guilds from the tenth century to the fall of Constantinople is shrouded in darkness.

A. E. R. BOAK

EUROPEAN. The origin of the mediaeval European guilds may probably be found in the religious associations of Germanic antiquity. Guilds existed in the ninth century in the Carolingian empire and also in the Anglo-Saxon countries as associations for protection and defense. At the beginning of the eleventh century they appear in the growing cities in the form of organizations of merchants. The trade of that epoch was essentially a foreign commerce. Merchants grouped themselves into caravans and traveled from one market to another; these caravans selected their own chiefs and obeyed self-imposed regulations. In the Germanic countries they were called either *gilde* or *hansa*; in the Roman countries they were usually called *caritas* or *fraternitas*. Their members were under obligation to defend each other in legal disputes and their purchases were made from a common fund. The solidarity thus established during their travels often continued after the return of such merchants to their own city. As early as the middle of the eleventh century the guild of St. Omer had a permanent headquarters, the *Gildehalle*, where the members (*fratres*) assembled, and it maintained a fund to care for its poor and sick.

At first the merchant guilds were doubtless mere voluntary associations. From the twelfth century on they began to acquire the monopoly either of the entire trade of a city or of some branch of it. For instance, in Flanders the London Hanse was an association of guilds from several cities the members of which had acquired the exclusive right to carry on trade in England.

It is easy to realize that isolated individual merchants would not have been able to compete with the guilds and that on the other hand it was in the interest of the guilds to prevent such individuals from engaging in trade outside their home cities. The feudal lords and the cities soon acknowledged officially the position which the merchant guilds had acquired for themselves. A commercial monopoly which at the beginning was nothing but a mere fact thus became an acknowledged right. The merchant guilds included in their membership practically all the rich merchants of a city. Moreover they exerted considerable influence in municipal government. But one cannot on that account assume, as did certain earlier writers, that the mediaeval communes developed out of the guilds. Even in England, where they were more numerous than almost anywhere else, the guilds were nothing but commercial associations; they were vested with certain municipal functions but were never identical with the municipal administration. In many cities the merchant guilds retained their privileges to the end of the Middle Ages. In others after the social revolution of the fourteenth century they disappeared or survived only in a very much attenuated form. The development of craft guilds for the separate professions tended to split the older organization into many sections. Especially in England the craft guilds at first ordinarily remained subordinate parts of the Gild Merchant. Even this nominal control soon disappeared and the Gild Merchant survived as a functioning organization only in places too small for the division of professions into separate crafts.

Alongside the merchant guilds organized exclusively for commercial purposes there were growing up by the twelfth century group organizations regulating industrial activity, which likewise bore the name of guilds (or craft guilds) in England and in some of the continental countries, such as Normandy, Holland and part of northern Germany. In most European countries, however, they were commonly designated either by the Latin name *officium* or *ministerium*, by the French *métier* (cf. the English *mystery*), in Dutch by *ambacht* or *neering*, in German by *Amt*, *Innung*, *Zunft* or *Handwerk* and in Italian by *arte*. The craft guilds seem to have first appeared about half a century later than the merchant guilds. As early as 1100 there were a number of them in the region between the Seine and the Rhine and by the thirteenth century they had been organized in practically every city of north-

ern Europe and England. The craft guilds constituted an essential and characteristic feature of the industrial organization of the Middle Ages; and although they differed in detail in many respects, the common spirit and general traits which they exhibited prove that they must everywhere be considered as different manifestations of the same general phenomenon.

There have been many disputes—and the question is still an open one—as to their origin. It was first sought, in accordance with the general tendencies of most scholars at the beginning of the nineteenth century, in the *collegia* and the *artes* into which the city artisans of imperial Rome were organized. These institutions were supposed to have survived the Germanic invasions to blossom forth again in the twelfth century in the form of craft guilds. It has been impossible, however, to establish any proof of their survival north of the Alps, and all that is known of the complete extinction of municipal life in the eighth and ninth centuries definitely militates against such a conclusion. Only in those parts of Italy which remained under Byzantine rule throughout the Middle Ages, such as Rome and Ravenna, does it seem likely that certain vestiges of the *collegia* of the empire were preserved. But this is a phenomenon of merely local significance and of too little importance to be linked to so powerful and universal a movement as the organization of industrial guilds.

The attempt to trace their origin to the demesne organization (*Hofrecht*) has not met with any greater success. It is true that there were on the large domains during and after the Carolingian epoch groups of all sorts of artisans—bakers, brewers, blacksmiths, weavers and so on—recruited from among the serfs who worked for the benefit of the lord under the supervision of overseers whose duty it was to organize their work. But it has been impossible to prove, as would be necessary to the theory, that during the period when cities were developing such artisans received permission to work for the public, that freemen joined with them and that little by little such groups, servile in origin, became transformed into craft guilds. On the contrary, it would seem that in many places groups of domanial artisans continued to exist for a considerable time alongside the craft guilds—sufficient evidence that the latter developed independently of the former.

Most modern scholars look to the free association of artisans as the most rational explanation of the origin of the industrial guilds. The urban

workers must, in short, have followed the example of the merchants. They similarly united into separate groups on the basis of profession or craft to secure for themselves mutual aid and support. It is certain that from the end of the eleventh century groups of artisans were united in religious brotherhoods, and it does not seem improbable that these brotherhoods aimed also at the economic protection of their members. The advantage of joint action to withstand the competition of foreign artisans was too obvious not to have forced itself upon the attention of such groups.

Important as was this free association of artisans to the development of the craft guilds, it must not be allowed to obscure the part played simultaneously by the exercise of public authority. In accordance with the Roman tradition the political rulers of the Middle Ages exercised the right to subject economic activities to their control. The Carolingian capitularies reserved to the emperor the supervision of weights and measures, the regulation of markets, the minting of coins, the administration of taxes; in other words, control over the dues levied on the circulation of commodities. The rapid decline of the royal power in the ninth century did not fundamentally change this situation. The feudal lords continued to exercise a similar power for their own benefit. The taxes and fines which they levied furnished them with a source of income that became more and more abundant with the revival of commerce, which in the course of the eleventh century led to the formation of the first urban agglomerations. The policing of the markets and the establishment of legal jurisdiction over them were bound to result at a very early stage in the development of rudimentary systems of regulations. The greater the influx of artisans to the increasingly numerous cities and the greater the variety of crafts set up, the more the castellan or the mayor who represented the territorial lord tended to subject their activities to his authority. It would be wrong, however, to believe that this was done with no other end in view but financial exploitation. No doubt dues were everywhere exacted from those who sold in the market or in their homes, but it is also probable that a certain amount of supervision was undertaken with a view to protecting the consumer against the rapacity of the producer. This was certainly the case in regard to the supervision of weights and measures. In addition, in the episcopal cities the bishops attempted to apply the principles of Catholic morality, estab-

lishing for all sellers a *justum pretium* which they could not exceed without being guilty of sin.

The available source material is too limited to make possible a reconstruction in any detail of the system by which the industry of that remote epoch was regulated. More precise information is to be had for the period beginning with the twelfth century; that is to say, with the appearance in the cities of communal organizations headed by magistrates selected from the bourgeoisie and devoted to the protection of their interests. The magistrates, the counselors or the jurors who exercised the municipal power seem at this time to have been responsible for the procuring of food supplies for the inhabitants. Although no regulations promulgated in that period have been preserved, it is certain that they did exist. The majority of them no doubt were concerned with the supplying of the city with foodstuffs and with trade in foods. At a very early stage, however, control must have been extended also to various industrial products necessary to the existence of the citizens. In Flanders in the second half of the twelfth century the magistrates promulgated ordinances which referred not only to bread and wine but to other commodities as well (*in pane et vino et ceteris mercibus*). Now it must have been impossible to legislate in regard to products without legislating at the same time in regard to the producers; without, that is, subjecting them to a supervision designed to insure the quality of the commodities offered for sale and without punishing them with fines or various other penalties in case of transgression. This development can be clearly seen in the records of the German town of Hagenau, where in 1164 the butcher who sold unwholesome meat or the baker who baked loaves too light in weight was expelled from the community of his fellows and by this very act deprived of the right to continue the exercise of his profession (*pro pena a consorcio ceterorum separetur*). If that was the case in Hagenau, a comparatively unimportant town, it is safe to conclude that the same situation existed and with greater force of necessity in cities which were richer, more populated and more advanced in their economic development.

The text of the records of Hagenau mentions a consortium of butchers and one of bakers. This expression clearly indicates the existence from that time on of distinct professional groups. The same document reveals that each of these groups was headed by a chief (magister) nominated by the mayor (*scultetus*) of the city and that

a similar organization was to be found even in such insignificant places as Hochfelden and Swindratzheim. It is thus possible to conclude that in the middle of the twelfth century throughout western Europe the division of urban artisans into publicly regulated professional associations was normal and universal. Each of these associations had a monopoly in the exercise of its profession. A number of documents have been preserved which prove incontestably the early existence of craft guilds and show something of their structure. In 1162 Louis VII of France, while placing a magister in charge of the bakers of Pontoise, guaranteed to them the exclusive right of preparing bread for sale, at the same time denying it to the millers and fullers, who had theretofore been in possession of the right. In 1099 the weavers of Mainz, in 1106 the fishers of Worms, in 1128 the cordwainers of Würzburg, in 1149 the blanket weavers of Cologne, were officially recognized groups. In Rouen at the beginning of the twelfth century the tanners were organized in a guild to which it was necessary for all those who wished to practise the trade to belong. In England references to the existence of craft guilds in Oxford, Huntington, Winchester, London and Lincoln are found for the period of Henry I (1100-1135) and after that time the institution spread rapidly to other cities. No records of equal antiquity have been preserved for Flanders, but it is impossible to believe that this country, where beginning with the twelfth century industry was more flourishing than in any other country of northern Europe and where craftsmen's associations were later to become so numerous and powerful, had no craft guilds at the time when they were first appearing in Germany, France and England.

It is thus apparent that beginning with the eleventh century the municipal authorities regulated the industrial activity of the cities through a division of the artisans into as many groups as there were distinct professions. Each of these groups received the right of reserving to its members the practise of a profession. The craft guilds thus constituted essentially privileged bodies; they were based on protectionism and exclusiveness and represented a system as remote as possible from that of industrial liberty. This very monopoly character was designated in England by the name of *gilda*; in Germany by the word *Zunftzwang* or *Innung*.

The value of the industrial regulations of the guild system to the consumers, who were in need of protection against fraud and falsification, is

easily seen. This end could have been achieved, however, by simple and direct supervision. If the grouping of artisans in associations for better control over their activities was natural, it is difficult to see any advantage for the consumer in the monopoly of their professions given the craft guilds. On the contrary, it would seem that this privilege in limiting the freedom of the consumers must have constituted for them a real disadvantage. In truth, it benefited only the producers, who were thus freed from all competition. The privilege in all probability was granted in response to their demands, for it would be difficult to explain it except as a concession by the legal authorities.

The earliest of the *fraternitates* or *caritates* organized by the city artisans doubtless not only aimed at mutual aid but also attempted to boycott foreign competitors. But these voluntary unions possessed no legal rights as against such competitors. In this respect their position with regard to non-members was exactly the same as that of the older merchant guilds. In time therefore they found it necessary to attempt to secure the right to coerce those artisans who refused to join with them either to abandon their professions or to accept guild membership. It is not difficult to understand why the public authorities acceded to this desire, for the guilds were willing to pay for the concession which they asked. In England the craft guilds paid annual dues in return for the industrial monopoly which they received from the crown; in Germany also the *Zünfte* of numerous cities were for the same reason liable to the payment of various kinds of dues or services.

The origin of the craft guilds can now be explained as the result of two factors acting simultaneously: legal authority and voluntary association. The two originally contradictory tendencies merge at the moment when the authorities officially recognize the workers' associations as compulsory, in reserving to their members the right to devote themselves to a particular branch of industry. The craft guilds can therefore be defined in essentials as privileged groups of artisans endowed with the exclusive right to practise a certain profession in accordance with regulations laid down by public authorities.

In many cities the nature of the craft guilds remained conformable to that definition. It is completely erroneous to believe that the guilds everywhere enjoyed complete autonomy with the privilege of self-government and self-control. Without doubt they were consulted in re-

gard to the technical regulations imposed upon them, and the supervisors responsible for the observance of such regulations were selected from among their own members. But it was the municipal authorities alone who had the right to legislate in regard to them and to appoint their chief officers. Wherever this was the case, they never became more than simple compulsory industrial groups functioning under the control of public authority. In this sense the German word *Amt*, which means function, characterized them exactly. In a city as active as Nuremberg, for example, the guildsmen were always markedly subordinate to the municipal council (*Rath*), which even refused to allow them to meet without authorization and forced them to submit to it all correspondence with artisans from foreign cities.

On the other hand, a very powerful movement toward independence developed in most of the cities of western Europe. In northern France, in the Netherlands, on the banks of the Rhine—in other words, in those regions where city life had developed earliest and most completely—the craftsmen's associations claimed a degree of autonomy which frequently led to conflicts not only with the public authorities but among themselves as well. The associations formed in the eleventh and twelfth centuries, far from disappearing after their official recognition, came to represent ever more clearly the solidarity of interests and claims of the different professions, until each of them formed a little industrial commune within the municipal commune. Beginning with the first half of the thirteenth century they claimed the right of self-government, the right to assemble and discuss their interests, the right to possess a bell and seal and even to participate in the conduct of the municipal government along with the rich merchants who were in control. In Rouen in 1189 the attempts of the artisans' associations seemed so formidable that they were deprived of a large part of their autonomy. Similar action was taken, to mention only a few examples, at Dinant in 1255, in the majority of Flemish towns and at Tournay about 1280 and at Brussels in 1290. This opposition, however, did not result in their destruction. In the course of the fourteenth century the craft guilds succeeded in obtaining the right to nominate their own senior officers or their jurors, to be recognized as judicial bodies and to share with the rich merchants in the conduct of the municipal government. In certain cities, as in Liège, their triumph was so complete as to put

them in complete control of the city administration, which after 1384 was headed by a council consisting of representatives of the thirty-two crafts of the city.

The achievement of political power by the craft guilds, which certain historians have rather inaccurately called a democratic revolution, made the municipal administration dependent on the frequently conflicting interests of these privileged bodies. The generalization may safely be made that the more effective the participation of the crafts in the municipal government, the more unstable the government became. This development can be clearly seen in cities like Ghent or Liège, which finally fell almost into a condition of anarchy. To reestablish order it was necessary to take from the craft guilds the autonomy which they had abused and to reduce them to the state of mere professional associations. This Charles V did in Ghent in 1540 and the bishop Ferdinand of Bavaria in Liège in 1649.

If the craft guilds differed considerably in degree of internal autonomy and political influence in various regions and cities, they were, on the other hand, everywhere markedly similar in their economic organization. In its fundamental traits the guild system was everywhere the same and everywhere it constituted the most striking feature of mediaeval urban economy. Like this economy in general it was distinguished by a spirit of extreme protectionism. Its principal aim was to protect the artisan not only against competition from other cities but also against the competition of his fellow workers. It gave him exclusive access to the city market and at the same time attempted to prevent any member of the profession from enriching himself at the expense of the others. It was largely for this reason that the guild regulations imposed with ever increasing minuteness techniques which they rigorously attempted to keep the same for all; for this reason that they established working hours, wages and prices, prohibiting advertising of all kinds, determined the number of tools and of individuals to be employed in each shop, appointed supervisors responsible for constant and inquisitorial inspection. In brief, they attempted to create a condition of complete equality for each member. The guild system thus secured the independence of the individual through strict subordination of all. The privileges and monopoly which the members of a guild enjoyed had as their counterpart the annihilation of all personal initiative. No one was allowed to injure another by improving the methods of production in such

a way as to allow him to produce more rapidly and at less cost. Technical progress was seen as disloyalty. The ideal was stability of conditions in a stable industrial organization.

Such a system since it largely prevents fraud undeniably does insure a high quality of product, and in this respect it benefits the consumer. It is evident, however, that the chief concern is the profit of the producer, who dominates a closed market. Emphasis on professional exclusiveness becomes increasingly evident in the later Middle Ages. Each corporation tended to restrict the enjoyment of its monopoly to an ever more limited number of persons. Many guilds even attempted to make membership hereditary. It is not surprising to find that beginning with the fourteenth century in many cities considerations of general welfare led the public authorities to attempt to substitute for the privileged industrial guilds a regime of freedom of industrial activity. An ordinance issued by Charles VI of France in 1358 clearly had such an object in view; similar attempts were made about the same time in Vienna and in the fifteenth century in Lüneburg and elsewhere. But at the time such reforms ran counter to too many interests to be successful. The craft guilds continued to exist in spite of constantly growing criticism until the end of the *ancien régime*. After the beginning of the sixteenth century their economic importance was continually reduced by the progress of the capitalistic industry which was growing up outside their sphere. They strove for a time to preserve at least their monopoly within the city walls. Yet their exclusiveness became more and more incompatible with the new economic conditions. By the eighteenth century in England the guilds had lost most of their former prerogatives and what remained were definitely abolished by the laws of 1814 and 1835. In France in 1776 Turgot abolished all but four of the existing guilds in favor of the principle of freedom of association; his action was effective for two years only, but in 1791 the guilds were completely destroyed by the revolution. Prussia and the other German states forced the disappearance of the last vestiges of the guild regime at the beginning of the nineteenth century. By the time of their legal abolition the guilds had lost all vitality and were characterized by a completely reactionary spirit. The opinion of scholars has differed, but it does not seem likely that the guilds influenced in any significant fashion the formation of modern trade unions or syndicalist organizations.

From an economic point of view the guild system was clearly anticapitalistic. With no place for individual initiative or the entrepreneurial spirit it was incompatible with the capitalist idea of profit making. It made it impossible for the artisan to reinvest his savings or his profits in business, since its volume was prescribed by the guild regulations.

On the other hand, there had developed in each guild a hierarchy of groups: masters, apprentices (*Lehrlinge*) and journeymen (*Knechte*). The masters, the dominant group to which the two others were subordinated, were chiefly small proprietors, owners of the raw material and of the tools which they used. The apprentices were initiated into the trade under their direction. The journeymen were workers who had completed their apprenticeship but had been unable to attain the rank of master. From the beginning the number of masters was restricted; no one could become a master without satisfying certain conditions—such as the payment of dues, legitimate birth and affiliation with the local bourgeoisie—which made the acquisition of the status rather difficult. After the fourteenth century accession to the mastership became more and more complicated and difficult of achievement. Indeed in most cities it tended to become a privilege reserved to those belonging to the families of the existing masters. The period of apprenticeship also was prolonged and its termination came to require the passing of increasingly difficult tests, at least for a candidate not related to a master. As to the journeymen, their position grew continually worse. It is true that they frequently lived with the master, were in close relationship to him and were directly associated with his work. But as the class of masters became more exclusive and consequently less accessible to the journeyman, marked antagonisms developed between the two groups. In certain cities in the fourteenth century and again in the fifteenth and sixteenth the journeymen attempted to seize control of the guild organization. Elsewhere they formed associations of their own, built up treasuries and organized strikes (see *JOURNEYMEN'S SOCIETIES*). On the whole the position of the journeyman tended progressively to become that of a mere wage worker.

The great majority of the craft guilds worked for a purely local trade. In general they had no other clients than the bourgeoisie of the cities in which they were located. But wherever an export industry existed, such as the cloth industry in the Flemish cities or in Florence, very different con-

ditions developed. In such cases the masters, themselves without the resources necessary to procure raw material, came under the domination of the capitalist merchants, who supplied them with wool. The cloth which they manufactured was then returned to the merchants, who sold it. The producer-artisan thus found himself in a situation closely resembling that of modern industrial homeworkers. Fortunately for him the guild regulations protected him against the abuses of a sweating system. But they could not protect him against the crises and the unemployment resulting from the fluctuations suffered by all the export industries through war, loss of foreign markets, competition and similar eventualities. On the whole the craft guild system was really well adapted only to local industry and especially to the supplying of the cities with food. Beginning with the fourteenth century the inadequacies of the system to meet the needs of export industries are apparent. In Flanders in the fifteenth century the cloth industry was declining in all those cities where the guild system was dominant. The development of capitalistic industries, beginning with the sixteenth century, took place outside the craft guilds either by their removal to the country or through the creation of privileged establishments whose freedom from interference was guaranteed by the state. The period of nascent capitalism was also the period in which the guilds continued to exist only as the result of privileges and monopoly already won, which the public authorities still respected out of a tolerance for acquired rights. By the seventeenth century the state was in many cases seeking to adapt the guild system to the needs of national industry. In France Colbert attempted to bring the guilds under his supervision. But in spite of all such attempts at adaptation the institution remained refractory to the progress of capitalism, which finally brought about its disappearance. In conclusion, the guild system must be recognized as the only source of protection to the worker before the period of social legislation in the nineteenth century and as an institution which at the height of its development assured the craftsman an existence as satisfactory from the economic as from the social point of view.

HENRI PIRENNE

ISLAMIC. Guilds developed in Moslem countries in the ninth century A.D. They did not derive from Moslem law but were an outgrowth of the unusual economic progress made in this

period by the great caliphal cities—first Bagdad, then Basra, Aleppo, Damascus, Alexandria, Cairo, Rey, Isfahan, Hamadan, Merv, Samarkand and Balkh. This advance was occasioned not by technical invention but by favorable political circumstances and was characterized by the concentration of both capital and labor. The concentration of capital was due to the creation of a caste of exchange bankers, at first Christian and later Jewish, close to the ruler in Bagdad and able to supply him with metal money; the concentration of labor was the result of the colonial slave raids subsidized by these bankers, under the pretext that they were "holy wars," in order to furnish labor for the workshops in the towns and for the plantations.

From their beginnings the Moslem guilds presented novel features, and although they were undoubtedly influenced by the ancient local Byzantine and Sassanian guilds they were by no means a mere revival of them. The Moslem guilds were rather evidence of the violent social reaction of the vast herd of workmen, laborers and peasants against the conquering class which had collected and enslaved them. Among them were shepherds and boatmen from the canals of lower Mesopotamia side by side with small artisans of Aramaean, Iranian and Coptic origin who had become as converted Mohammedans the "clients" of the conquering Arab tribes and had settled beside their *jund* or fortified camps located at strategic points throughout the empire.

The history of the guilds is closely connected with that of the Karmathian movement, the great social, political and religious upheaval which swept the Moslem world between the ninth and twelfth centuries. The Karmathians developed a vast Masonic society, which was extended among the merchants, peasants and artisans and which developed and diffused guild organization. Although a majority of non-Arabs and even non-Mohammedans were admitted to membership, their revolutionary activity cannot be regarded as racial and anti-Arab, as certain historians have held, for their purpose was not to destroy Arab rule and to revive the old nationalities and the ancient religions but rather to establish equal administrative and social justice for all while preserving the unity of a truly international Islam. This tendency had already evidenced itself from 868 to 883 in the revolt of the Zanj slaves of Basra, who, scarcely Mohammedanized, demanded liberty and equality under the leadership of an Alide. The movement, systematically diffused by the interconfessional

Freemasonry of the Karmathians, won a decided victory when an analogous legitimist conspiracy resulted in 909 in the proclamation of the Fatimite caliphate, which soon gained control of Cairo and which officially recognized the existence of the guilds, their franchise and their legal autonomy.

In the eleventh and twelfth centuries the guilds (*ahl al-futuwa*, *fityān*), promoted by Fatimite agents, spread throughout the entire Moslem world. This situation was, however, short lived, for the guilds were weakened by dissensions between rival initiations (*Rahhāsīya*, *Shāhānīya*, *Khalīliya*, *Mawlūdīya*, *Nābāwīya*), which were probably the results of the dynastic schisms of the Fatimite caliphate; and purely immoral guilds of thieves and forgers, like the *Banū Sāsān*, terrorized the workmen. When the Fatimite dynasty, which protected the guild movement, collapsed, the authoritarian reaction of the Sunnite states which followed definitely brought the development of the guilds to an end by subjecting them to the severe control of an orthodox urban police, the *ḥisba*, an institution derived from the early canonical doctrine of the caliph's right to regulate the morality of the markets. It was revived by the state in the twelfth century for the purpose of curbing the guilds which were suspected of Karmathian and revolutionary tendencies and it practically ended the period of independent guild activity. This repression was the work of Saladin in Egypt and Syria, of the Seljuks in Anatolia, where guild insurrections continued to occur in the fourteenth and fifteenth centuries, and of the Mongols in Iraq and Persia. Spain, where the guilds appear never to have demanded autonomy, in the fourteenth century adopted the police regulations of the *ḥisba* and transmitted them to Maghreb when the Andalusian guilds spread to that region, to Morocco in the fourteenth century and to Tunis in the seventeenth. For four centuries the Mohammedan guilds vegetated, further hindered by the lack of advance in technical processes, for the police repression allowed only the artisans "in attendance at the court" to prosper; that is, the purveyors to the sovereign, who had a monopoly of his orders. Nevertheless, for centuries guild organization persisted in most of the crafts, trades or professions. Its prevalence is indicated by the fact that about 1640 at Istanbul there were about 1100 guilds centralized around the great bazaars, known as the *Bezestān 'atīq*, *Sandāl Bezestāni*, *Miṣr Tchārchisi*, *Yēni Tchārchī*, *Ūzūn Tchārchī*, *Esīr Tchārchisi*,

Tāwūq Bāzārī; in Cairo in 1798 the guilds occupied twelve great bazaars (*khāns*), about eighty markets (*sūqs*) and from 1200 to 1300 stores.

The Moslem craft guilds which had originated as democratic organizations always retained this character. They never went through a process of stratification as in the west. Membership in certain guilds, such as those of the bankers and of dealers in precious metals, was confined to the Jews and Christians since they alone were allowed to engage in such pursuits. Various terms are used to designate guild: *sinf* (pl. *asnaf*) was the name used in Persia, the Punjab and the entire Ottoman Empire; *hanta* (pl. *hanātī*) was employed only in Morocco. The common name for guilds, however, is *naqābat*, which means *syndicates*. Their functions are the regulation of the craft or trade, the retention of trade secrets, the fixing of fair prices and the maintenance of standards of workmanship.

Each guild contains masters (*mu'allim*), journeymen (*Khalīfa*, *muta'allim*), workmen (*sānī*) and apprentices (*mubtadi*). The apprentice becomes a master in a semi-Masonic ceremony, in the course of which a sash or some piece of material is knotted around him after he takes a solemn oath. The ceremony is followed by a banquet. For the last forty years this ritual has tended to disappear even in Persia. The president of the guild (*naqīb*, *pir*, *amīn*, 'Arif'), who is either chosen by the members with the consent of the government official in charge of guilds (*muhtasib*) or appointed by him, has considerable authority over the members. In important matters, such as the fixing of prices, he must, however, consult with this same official. The president acts as the representative of the guild in all public affairs, sees that the code is strictly observed and arbitrates differences between members, who may appeal from him to the court of the *qādi*. This court also renders decisions in disputes between two or more guilds. In some of the Moroccan guilds, where Berber influence is very strong, representative councils take the place of the president in directing guild activities. The president together with two members of the guild regulated guild affairs in Turkey before 1924. Where the guilds are very weak the president is a mere intermediary to carry out government orders.

Every guild has a traditional custom by which it is regulated. This custom is usually written in small record books, catechisms of initiation (*Kutub al Futuwa*), containing questions and answers. The ceremonies which they described

and which the Moslem congregations borrowed from them are mentioned by historians after the middle of the twelfth century, and one of these catechisms of the year 1290 in a Turkish dialect has been found by Babinger. Thorning has translated some belonging to Arabs from Egypt and Syria; Gavrilov, Likochine and Samoïlovich have published some from Turkestan and Massignon has translated some from Persia.

The Moslem guilds never attained a political influence comparable to that of the mediaeval European guilds. There are, however, indications that the guilds were important political factors from time to time. Under the Fatimites they were sufficiently influential to have their own courts. The "bankers of the court" (*jahā-bidhat al-Haḍra*) played an important role at Bagdad from 908 to 940 and there were guild insurrections even as late as the seventeenth century at Istanbul.

In the course of the nineteenth and twentieth centuries the excessive large scale importation of European manufactured products and the introduction of machinery and European industrial organization succeeded in destroying the old Mohammedan guild forms without much difficulty. In a number of places the guilds still persist, although they are rapidly disappearing; in French north Africa the Moslem guild organization exists officially only in Tunis. While in the Occident there elapsed a century, during which a great advance of mechanization took place, between the disappearance of the mediaeval trades and the creation of the first modern *syndicats*, in the Orient these two social phenomena took place almost simultaneously; at Damascus the guilds studied by Qudsi in 1883 gave way to the *syndicats* well before 1927, the year in which the latter were studied by Massignon; at Bokhara the transformation took place between 1918 and 1924. In Turkey prohibitive laws tended to suppress the old *syndicats* (*guedik*) until 1924.

LOUIS MASSIGNON

INDIAN. The question of how far the term guild can accurately be applied to the associations of merchants and artisans of ancient India is a controversial one. There is no doubt, however, that even in the remote past Indian industry and trade assumed a form and were conducted by methods closely resembling those under which the guild system developed in the West, and that persons following the same trade or industry grouped themselves into associations

which amongst wider social and religious functions regulated the economic life of their members. These associations, which secured social and legal recognition of their status, rights and activities and possessed a true corporate existence, may conveniently and appropriately be called guilds. Their rise, development and decay in India as elsewhere were intimately connected with the general development of industry and trade. A precise parallel with the history of European guilds is, however, impaired by India's peculiar type of social organization, which involves a stronger theocratic bent and above all the crystallization of class into caste. Accordingly authorities have differed about the nature of Indian guilds, some seeking to emphasize and others to blur the contrast with the European system. The recent revival of interest in Indian institutions and corporate life has, however, led both to a more accurate study of the ancient texts for material and to more detailed inquiries about existing institutions.

The origin of Indian guilds is lost in the obscurity of the remote past; early Hindu and Buddhist evidence, however, refers to local bodies of this type. Their existence can be definitely traced to about 600 B.C., the beginning of the Buddhist era; and since at that time they had considerable influence and importance, it may be inferred that they originated much earlier. By the beginning of the seventh century B.C. Indian society was sufficiently settled to enable the development of that degree of specialization of occupations and function necessary to the rise of such institutions as guilds. There was considerable subdivision of labor, and numerous separate crafts and special classes concerned respectively with trade, usury and other commercial activities had been formed. The extent of the localization of industry in towns and in streets was remarkable. The *Jatakas* mention no fewer than eighteen separate trade guilds, four of them by name.

During the Buddhist era from 600 B.C. to 300 A.D. the guilds grew in influence and power, especially in areas where Buddhism and Jainism predominated; at the end of that period guild organization had become a highly important factor in state politics and had probably attained its fullest development. Buddhism and Jainism naturally favored the development of the guilds, for both movements were democratic and represented above all a revolt against the tyranny of Brahmanism embodied in the kings and organized priesthood of the times. The Buddhist order

preached equality as against the exclusive rights of Brahmans to partake of the spiritual life. Accordingly it received the support of the third caste, the merchants and artisans, and in turn tended to increase their power and authority. The interests of the industrial and mercantile classes and therefore of the guilds were accordingly advanced, but it should not be forgotten that the members of certain occupations were looked down upon by Buddhist and Hindu alike and that caste rules rigidly restricted admission to the guilds.

The growth in importance of the guilds during the Buddhist period is evidenced by both literary and epigraphic sources. It appears most clearly in the changing attitude evinced in the earlier and later Hindu law books. In those referring to the period from 600 to 200 B.C. references to the guilds are somewhat vague and indefinite, and custom and the laws of caste appear preeminent. *Manu* (VIII: 41) and the later law books (*Dharma Shastre*), on the other hand, give evidence of their independent status and jurisdiction. The great epics, especially the *Mahabharata*, compiled in its present form about 350 A.D., fully support legal and Buddhist evidence as to the prevalence, importance and high status of the guilds and their leaders. The still later law books, those referring to the Puranic era, which witnessed the downfall of Buddhism and revival of Hinduism between 300 and 800 A.D., do, it is true, furnish some new and more detailed information with regard to guilds. Nevertheless, guild powers and status appear to have altered but little and certainly show no advance over those of the Buddhist period. It is accordingly possible to summarize the position, functions and government of the guilds as they developed in the period beginning about 600 B.C. and extending approximately to 900 A.D.

Ancient Indian civilization evinced a highly organized group life, in which the state, the individual and the various intermediate groups, including guilds, had a definite sphere upon which the others might not encroach. The authority of the guilds was not derived from the delegation of power from above, but had an independent, spontaneous existence. There were at all periods many types of guild: the village guilds, which included within the same guild either all or at least the superior classes of the working population; in the towns the merchants', bankers', money lenders' and artisans' associations, the different crafts having their own separate guilds, possibly coordinated by a *maha-*

jan, representing guild life as a whole; the guilds of cultivators, shepherds, seamen and others. The line of demarcation between caste, guild and communal village association is not always clear; and it is possible that sometimes these merged into one general organization, which met on different occasions for different purposes, while sometimes the membership and organization of the guilds were permanently separated from those of the other associations. Guilds were formed throughout India, but their organization was naturally more complex in industrial and urban centers. In the latter, merchants as well as craftsmen had their separate organizations and also took the lead in guild life as a whole. The *mahajan*, or head of a merchant guild, might represent all local guilds in legal matters, at the court or in dealings with other localities or corporations.

The guilds were corporate self-governing entities: their status and rights were upheld by law; they collected fees and taxes, possessed property, had powers of corporate contract, received gifts, had banking functions and acted as trustees for religious endowments. They expended their revenues upon the establishment and upkeep of religious and charitable institutions such as temples, rest houses and animal hospitals and upon such public utilities as wells and water-courses as well as upon the relief of distress. They acted as courts for the settlement of disputes and their contracts as corporate bodies formed part of the general law on the subject. The king was to enforce his own law only after careful examination of the laws of castes, districts, guilds and families and was bound both to respect and in certain circumstances to enforce the laws of the guilds. On important occasions also the king evoked guild organization to summon the people.

The guilds always had a religious basis: the spiritual and economic functions were combined in the same institution. In many cases the religious castes have been and still are coterminous with guilds; nevertheless, the connection between caste and trade associations has never been complete or universal, and while guilds have in some cases reenforced caste, in others they have cut across and tended to weaken caste lines. In Buddhist times social divisions and occupations were not always the same, and although a man customarily followed his father's profession he did not always do so. Buddhist literature provides many examples of the son adopting an occupation other than his father's.

In general it appears that in areas with a homogeneous population caste and guild membership frequently coincide, while elsewhere, especially in large towns, guilds include members of various castes. Economic changes, entailing an increase in the demand for labor in certain trades and industries, which the older caste guilds could not satisfy, led members of other castes to adopt the expanding occupations; and eventually the common interests of those engaged in the same occupation led to the formation of new associations or guilds including members of various castes.

During this period considerable and highly skilled industrial production was carried on in India. The artisans were divided into a large number of crafts, including weavers, potters, leather workers, painters, woodworkers, ivory carvers, workers in the precious metals and other metal workers. The members of the various crafts were organized into separate guilds, which laid down rules with regard to the status and pay of the workers, the methods and quality of the work, prices and terms of trade. The apprenticeship system appears to have been very similar to that prevalent under the European guild system. The apprentice lived for a fixed term of years with his master, who was to treat him "like a son." The guilds were customarily governed by a board of from two to five persons presided over by an alderman, who was usually chosen by unanimous acclamation at a general assembly. The alderman, sometimes called the *sheth*, or *seth*, was also frequently the head of the caste where caste and guild coincided or of the predominant caste in the case of a "mixed" guild. As a rule the position was hereditary, so that on the death or retirement of the *sheth* his son would be appointed unless obviously unfitted for the post.

Since the end of the Puranic era, especially during the Dark Ages from the ninth to the eleventh centuries and the period of mediaeval Mohammedanism from 1193 to 1526, evidence is scanty with regard to social organization in general, and that relating to guilds is practically limited to a number of south Indian inscriptions. Nor is there more information on the Mogul period after 1526. Later literature down to the present contains isolated references to guilds but except for one or two special inquiries no systematic treatment of the subject. It is clear, however, that although the Mohammedans were deeply affected by Hindu social organization and tended to form both castelike classes and occupational

guilds, sometimes separately, sometimes jointly with Hindu workers in the same trade, nevertheless the power of the guilds was bound to wane. This was due to the increasing importance of the middlemen during the Mogul period and still more after the introduction of British rule. The middlemen organized production and trade and even in some cases collected the artisans into workshops. Many artisans thus lost their former position as master craftsmen and became dependent upon the middlemen.

The chief economic factors involved in the decline of the guilds during the British period were the growth of both internal and foreign trade and the increasing competition of imported products, both largely due to transport improvements and the general decay of corporate cohesion. The growth of trade involved increased specialization and localization and the growth of the factory system, thus tending to increase the need for capital. The artisans no longer sold direct to the consumer but became increasingly dependent upon the merchant. In their turn the small town merchants became dependent upon those in the larger centers. The same economic forces also loosened the connection between guild and caste, as the members of several castes adopted similar crafts. This had in general an adverse effect upon corporate cohesion, and the latter was at the same time threatened by administrative changes due to British rule, which reduced the power and functions of village and other local officials. The reconstruction or rather destruction of local government in India after the introduction of British rule undoubtedly tended not only to break up the traditional social organization but also to engender indifference and ignorance concerning indigenous forms of economic life. Meanwhile the competition of imported manufactures threatened the prosperity of Indian hand workers. Cheap factory goods wrested part of their former home and overseas markets from Indian craftsmen and reduced prices even where sales were maintained. Certain handicrafts were practically destroyed during the nineteenth century, while none of the indigenous industries expanded in proportion to the increase in population. The blow to native industries naturally intensified the breakdown of the native system of industrial organization.

Nevertheless, guilds survive to the present day. The lack of information, however, makes it difficult to generalize concerning their organization, strength or even territorial distribution. Where guild organization persists, the descrip-

tion of the ancient guilds given above seems to be still largely applicable; but the tendency is for the middlemen to absorb more and more power, whether the artisans still work at home or in the increasing number of small workshops. The banking functions of the guilds and the system of formal apprenticeship are also disappearing. Even in Ahmedabad, the center of present day guild life, the guilds have no written laws and their procedure is governed by custom. It has been said that their practises tend to be modified by the ever increasing number of merchants and manufacturers who do not belong to any guild and whose methods are more modern. An investigation of the guilds of Gujarat and Rajputana in 1896 revealed that they arbitrated in trade matters, fixed wages, prices and hours, organized strikes, ordered trade holidays, organized festivities and when necessary enforced their rules by boycott and ostracism. Detailed studies of the guilds of southern India, especially of Madura and the Benares silk weavers' guild, have been made in recent years. According to most observers Gujarat, centering on Ahmedabad, and southern India, particularly around Madura, remain the strongholds of guild organization; but it is asserted that survivals are widely scattered, being found in most ancient cities, such as Surat, Jaipur, Delhi, Benares, Dacca and Conjeeveram, and in districts, such as the Konkan, Kathiawar, Khandesh and Baroda. From the studies made it is obvious that guild life is rapidly declining. Even the swadeshi movement with its emphasis upon the revival of the handicrafts and local corporate life has not concerned itself with reviving the guilds, for it is clear that they are no longer sufficiently important, widespread or powerful to form a sound basis for the regeneration of either rural or urban life.

VERA ANSTAY

CHINESE. The absence of records makes it impossible to establish definitely the date of the earliest appearance of guild organization in China or the exact reasons for its development. Sources which trace the origin of guilds back to the Chou dynasty, when economic life was organized on a highly paternalistic basis, are probably unreliable; but it may be authoritatively stated that guilds existed a thousand years ago. During the period when governmental control was unduly burdensome they may have been formed for protection against official exploitation. When subsequently the role of economic direction was given up by the state, extra-official organizations

for regulative and protective purposes became necessary. This regulative function, although most important, is not the sole explanation of the origin of the guilds. There is a theory that they developed from purely religious associations; this is supported, however, only by the fact that each has its patron saint and that worship is a feature of guild meetings. The evolution of certain guilds seems to be closely connected with the clan family: a family monopoly of an occupation in a single family village may have been perpetuated through the guild as the village expanded into a multifamily town, or a monopoly of a particular trade developed under family control may have been extended elsewhere through guild organization. Some occupations, such as banking and acting, have been controlled by natives of particular provinces and others are known to have been carried from one section to another; such guilds, however, appear more closely related to the provincial guild than to the clan family system. Common to all the guilds are their strictly local character, corresponding to the localism of Chinese life, and their monopolistic basis.

Several types of guild have existed and still exist in China. One general type of guild organization is characteristic of the various crafts, trades and professions. There are of course some minor differences. Among the crafts guilds are composed of both masters and artisans, a distinction unnecessary in the professions; while in the trade guilds each shop is usually represented by one person and workers are not included as members. At the time when these guilds exercised effective control they determined the conditions and the period of apprenticeship, which was usually from three to five years, and frequently set the number of apprentices per master, thus effectively regulating the labor supply at its source. Penalties were imposed for the enticement of workers from one shop to another and a minimum wage was fixed in relation to the customary standard of living. Occasionally, when adjustment to changing price levels was not sufficiently rapid, the artisans formed temporary organizations to bring pressure upon the masters, who actually controlled guild affairs despite the inclusive membership and democratic basis. Since the labor supply was limited artisans could cause grave inconvenience and loss by stopping work, while the incidental disturbance of the peace might also bring about official intervention; accordingly they usually secured a speedy readjustment of wages.

To eliminate unfair competition the guilds established minimum prices for goods or services, and violations were penalized. Weights and measures were made uniform for the locality by guild action. The exchange business, of great importance in a country with wide local variations in the currency, was in the hands of a bankers' guild, which announced exchange rates and performed other necessary functions. This is the closest approach to a national guild, since almost all the bankers came from the Shansi province and were controlled from the place of origin as well as locally. The importance of the Shansi bankers, however, has decreased with the establishment of modern banks, the association of which has to a large extent supplanted the old guilds.

In addition to the craft guilds there exist provincial guilds. The official or merchant who lived beyond his native province was in an alien environment, segregated from the community by a language barrier and by marked differences of custom. He was liable to discriminatory treatment by the officials because he did not have community support and by the people because he was a foreigner. As an individual he had to deal with organized groups, guild or familial. Consequently all from the same province drew together; guilds were organized which served a social purpose, gave their members a group status and legal protection and also provided uniform conditions of trade.

A third type of Chinese guild is the guild merchant; that is, the association of the entire merchant group of a particular place for the purpose of regulating and improving its commerce. In addition the group exercises a number of municipal functions, such as the upkeep of streets, drains and reservoirs and the administration of poor relief. The only known example of such guilds are those of Newchwang, Swatow and Canton, all of which succeeded in controlling the conditions of native and foreign trade within their localities.

Chinese guilds are democratic in organization. Periodic meetings of members are held to select officers and establish guild rules. Administration by an elected committee is the general rule except in the provincial guilds, where the function of the committee is advisory. The latter have an annually elected salaried manager and a permanent secretary, who is chosen from the literati. The wealthier craft and trade guilds also employ literati as secretaries. Final power, however, resides with the members; the function of

committee and officers is to administer policies established at the annual meeting.

Since the activity of public magistrates was virtually limited to the maintenance of order and the collection of taxes, the guilds assumed an unusual importance, playing a regulative and directive role in the towns similar to that of the family in the villages. Guild rules took the place of a commercial code, which was enforced primarily through guild action. The magistrate was a stranger, unfamiliar with local custom and without the support of family connections, and his superiors judged him by his ability to maintain order. If he imposed new taxes or increased the customary levies without consulting the guilds, disorder ensued and he was liable to censure. The same consequences followed if he interfered in the settlement of disputes between guild members. Accordingly he was willing to deal with the guilds, holding them responsible for the performance of such of his functions as they could assume. Guild rules required that disputes be submitted to guild arbitration before they were taken to the magistrate, and penalties were imposed for violations. When appeals were taken, there was no law except guild regulations to guide the magistrate; and therefore he usually confirmed the decision. This relationship between the magistrate and the guilds resulted in a virtual transfer of judicial authority in civil and commercial cases.

Until recently the guild system effectively organized China's economic life. Its strength came from the governmental system and the handicraft basis of industry, which made necessary long apprenticeships and permitted effective control of the labor supply. Furthermore, the nature of communications was such that production was required for direct consumption within a restricted area and could be adjusted to demand, and price fixing was made easy. The limited productivity inevitable in a handicraft system and the intimate relationship of employer and employee, characteristic of the domestic system, were also factors.

Since 1900 conditions have changed essentially and guild control has been correspondingly weakened. Competition is being substituted for the cooperative system of the guilds. Improved communication has undermined local economic self-sufficiency, brought into competition goods produced beyond the jurisdiction of the local guilds and made labor more mobile. The labor supply has also been increased by the introduction of machinery, which renders long ap-

prenticeships unnecessary. Machine production moreover involves the factory system, corporate financing and employers and managers who, unlike the masters in handicraft industries, have no contact with the workers. The new industry, partly financed and managed by foreign interests, has never been fitted into the guild structure and weakens the monopoly upon which guild authority rests. Goods of external production cannot be regulated either as to price or standards, except through trade guilds, which operate without regard to the interests of producers. Furthermore, the new conception of government threatens the power of the guilds unless they are formally incorporated in the political structure.

These new conditions have resulted in the organization of chambers of commerce provided for by national law, which now exercise some of the guild functions, notably that of arbitration. The Chinese chambers are partially erected on a guild foundation, having guilds as well as individual concerns for members and serving as interguild organizations. In this new relationship the guild is becoming an employer's association, while labor is becoming unionized. Consequently, although guild organization continues to exist it has been seriously undermined and may be either destroyed or reorganized under the pressure of governmental intervention, labor organizations and the amalgamation of employers into chambers of commerce.

HAROLD M. VINACKE

JAPANESE. The guilds of Japan appear to have been associated in their origins with common religious observances; but by the Hojo era (1220-1333) they had become mainly economic in character and were termed *za*. During the Ashikaga period (1335-1573) they came to play an increasingly important part in the economic life of the country. Each *za* consisted of a group of local merchants who were dealing in a particular line of goods and had secured from the shogun, from a feudal lord or from a temple privileges conferring upon them a monopoly of trade in return for periodical payments. The guild prescribed the conditions of trade and entered into arrangements with similar associations in other localities. Membership was strictly limited and became hereditary in character. Although the *za*, unlike the merchant guilds of Europe, did not become closely associated with local government, they achieved positions of considerable power. For example, groups of *za*

were formed which acquired from the feudal lords in some parts of Japan the right of controlling local customs barriers and even the use of the highways. The triumph of Nobunaga and Hideyoshi in the civil wars of the later sixteenth century led to the decline of the guilds. Desirous of increasing the authority of the central government and jealous of the power of the *za*, Nobunaga abolished their privileges and so created a period of comparative freedom of trade.

After the accession of the house of Tokugawa to the shogunate in 1603 this policy was gradually reversed. At first, however, the only guilds recognized by this government were those created on its own initiative and under its direct control. They were composed of groups of persons to whom special privileges had been given by the shogunate so as to enable it to carry out its policy concerning weights and measures, coinage and other matters in which the government had special interests. The term *za* in this period was limited in its application to associations of this kind. Other associations arose spontaneously during the seventeenth century, and as the economic development of the country had led to increasing specialization among dealers and craftsmen, several distinct types of guild appeared. The shogunate had at first shown hostility toward these organizations, but by the beginning of the eighteenth century it began actively to encourage their formation in order to facilitate administrative control over the mercantile and industrial classes. The Trade Association Decree (*Dogyo kumiai kai*) of 1721 provided for the establishment of guilds in many branches of commerce and recognized the existence of craft guilds which were not already under the government's special control. The most important guilds formed among traders were those of the wholesale merchants, which were called *tonya* associations. These sprang up in all Japanese towns during the seventeenth century as a result of the growth of internal trade; there was a great increase in their numbers after the decree of 1721. Upon receiving recognition from the central or local government each *tonya* guild was granted a monopoly of trade in the line of goods with which it was concerned; the district of the town in which its operations could be carried on was specified; membership was limited; the names of members were registered with the authorities; and dues collected from members were paid periodically to the government. The privilege of membership, known as *kabu*, became marketable and

could be obtained by an outsider only by the purchase of an existing member's rights. Among the *tonya* guilds those of Yedo (Tokyo) and Osaka were of the greatest importance; and in 1694 an association of certain *tonya* guilds of Yedo, known as *tokumi tonya*, was formed, which preserved a monopoly of the import trade from Osaka for about a century and a half.

Local craft guilds (*kumiai*) are believed to have existed in the Ashikaga period, but they did not become of substantial importance until the seventeenth century. Certain families or groups of craftsmen then possessed special privileges conferred on them by the government, among which freedom from state taxation was often included. The restriction of the numbers enjoying these privileges led, as among the *tonya*, to the creation of a marketable *kabu*. In many trades, however, workmen outside these groups formed themselves spontaneously into *kumiai*, especially after the decree of 1721, and sought recognition from the shogun or the clan governments in return for payments in money or labor. Where a *kabu* did not exist and membership was not limited to a fixed number the admission of new members was decided at a *kumiai* conference. The members elected their officers and in their corporate capacity they prescribed the quality, output and prices of the products, the residential area of the trade, the conditions of work and the regulations governing apprenticeship, which was usually from seven to ten years in duration. The *kumiai* also provided mutual assistance for members in distress.

By the early nineteenth century the *kumiai* were pursuing an increasingly restrictive policy regarding membership, and this led to a growth in the number of journeymen (*shokunin*), who although qualified by apprenticeship for the status of master craftsmen were unable to obtain membership in the guilds and remained in a position of subservience to the members. At the same time the debasement of the currency was causing a rise in prices which was productive of much social distress. For this the monopolistic policy of the *tonya* and craft guilds was held responsible, and between 1841 and 1843 the shogunate issued decrees abolishing all classes of guilds. For a time this resulted in economic chaos. Trade was disorganized and the credit system, which rested on *kabu*, was destroyed. There was an attempt to revive the guilds in 1851; by this time, however, the shogunate itself was crumbling and it was found impossible to reestablish the monopolistic privileges on which

the guilds were based, especially as the number of *shokunin* was then rapidly increasing. Moreover, the isolation of Japan, which had helped to preserve the guilds for so long, had by this time been broken down and western influences were beginning to affect the life of the country. The system was finally swept away in the reforms which attended the restoration of 1868.

The guilds of the modern era are essentially a creation of the state; they were called into existence by legislation first enacted in 1884 and after that frequently extended in scope. Japanese industrialists and traders in the latter part of the nineteenth century suffered from an evil reputation on account of their malpractices, and the object of the government in encouraging the formation of these modern guilds (*Dogyo kumiai*) was to raise commercial standards in Japan as well as to foster cooperative action among manufacturers and merchants and to promote and control industrial and commercial development. At the present time local organizations known as Staple Production Guilds exist in connection with almost every important branch of industry. Their regulations usually provide for the inspection of the quality of their members' products with the object of safeguarding the common reputation of the trade. Besides these, various types of export guilds have been created by law with the purpose of increasing Japan's foreign commerce by cooperative effort among the merchants and manufacturers concerned. The most important function of these guilds is to insure a rigorous inspection of goods destined for foreign markets. In the case of merchants dealing in certain commodities guild membership is compulsory. It is characteristic of Japan, which has never been influenced by laissez faire doctrine, that its government should take over ancient principles of economic regulation and express them in forms appropriate to the modern world.

GUILLAUME, JAMES (1844-1916), French revolutionary theorist and historian. Guillaume was born in London of middle class parents. His father, a Swiss of French origin, had been a liberal politician in Switzerland and was naturalized as English. His mother was French and in 1889 Guillaume was naturalized as French. Guillaume studied at Zurich from 1862 to 1864 and became an instructor in the trade school at Le Locle, Switzerland, a position he was forced to resign in 1869 because of his revolutionary political views and teachings. Coming into contact with the French cooperative movement and the branch of the International Workingmen's Association at La Chaux-de-Fonds, he became active in the Jura revolutionary movement (Fédération Romande 1869-78). Under Bakunin's influence he abandoned his early ideals of the development of individual perfection and turned to the development of mass consciousness and

solidarity as a means toward social revolution. He was one of Bakunin's chief supporters in the anti-authoritarian group in the International and followed him in the split with the Marxists. He edited a number of revolutionary journals, the most important of which was the *Bulletin de la fédération jurassienne* (1872-78). He advocated abstention from politics and the use of the general strike but not of partial strikes. In 1878 he abandoned revolutionary work. With the rebirth of the antistate philosophy in France toward the end of the century under the name of syndicalism he became again an active propagandist, contributing frequently to the *Bataille syndicaliste* and the *Vie ouvrière*.

As a historian Guillaume specialized in the study of revolution. His chief works are collected in his *Études révolutionnaires* (2 vols., Paris 1908-09), which corrects many errors of earlier authors. He also wrote *L'Internationale: documents et souvenirs* (4 vols., Paris 1905-10) and "Michel Bakounine, notice biographique" in *Oeuvres de M.A. Bakounine* (6 vols., Paris 1891-1913, vol. ii, p. 1-60). His *Karl Marx, pangermaniste, et l'association internationale des travailleurs de 1864 à 1870* (Paris 1915) argued that German socialism was from its very origins a nationalistic and imperialistic movement. All these works contain rare documentary material.

Guillaume was also active in education: he collaborated on Ferdinand Buisson's *Dictionnaire de pédagogie* (5 vols., Paris 1882-93) and, beginning a short time after he had settled in Paris in 1878, he served as secretary of the *Revue pédagogique*. He made critical résumés of educational legislation and institutions of the whole world and also published a great collection of the *Procès-verbaux du comité d'instruction publique de l'assemblée législative* (Paris 1889) and *Procès-verbaux du comité d'instruction publique et de la convention nationale* (5 vols., Paris 1891-1907).

Guillaume's *Le collectivisme de l'internationale* (Neuchâtel 1904) and his *Idées sur l'organisation sociale* (La Chaux-de-Fonds 1876) sum up his libertarian and equalitarian collectivist philosophy.

M., *Pervy international* (3rd ed. Moscow 1923), tr. by Eden and Cedar Paul as *History of the First International* (New York 1928); Buisson, Ferdinand, and Aulard, A., in *La révolution française*, vol. lxx (1917) 10-18.

GUILLAUME-SCHACK, GERTRUD (1845–1903), German feminist and socialist. The daughter of Count Schack von Wittenau, Frau Guillaume-Schack had led a sheltered existence until her marriage with the Swiss artist Eduard Guillaume brought her into contact with the world. In Paris she learned of the work of the British, Continental and General Federation for the Abolition of Government Regulation of Prostitution, organized in 1875 and later called *Fédération Abolitionniste Internationale*, whose founder, Mrs. Josephine Butler, she met at the Liège conference in 1879. Fired by zeal for this work, she returned to Germany and in 1880 founded in Beuthen a similar association, the *Deutscher Kulturbund*. A branch was organized in Berlin in 1883, another in Elbing the following year. By petitions, pamphlets and public addresses (some of which were printed in the collection *Die öffentliche Sittlichkeit*, 5 vols., Berlin 1881–82) Frau Guillaume-Schack proclaimed throughout Germany the injustice and failure of police regulation. The police retaliated by dispersing her meetings and arresting her for disorderly conduct. This treatment and even more her ostracism by her own social group drove her eventually into the socialist fold. Accepting the socialist doctrine that prostitution is an economic problem she devoted her energies to bettering the condition of working women. She published a weekly journal and founded numerous working women's associations. These activities rendered her doubly *déclassée* and, in the decade when Bismarck was trying to eradicate socialism, politically objectionable. Her journal was suppressed, her organizations were disbanded and she herself had to leave Germany in 1887 for England, where she spent the rest of her life. Although she continued to attend conferences of the federation she was never again active in its service.

HUGH WILEY PUCKETT

Consult: *Handbuch der Frauenbewegung*, 4 vols., ed. by H. Lange and G. Bäumer (Berlin 1901–02) vols. I–II; Plothow, A., *Begründerinnen der deutschen Frauenbewegung* (Leipzig 1907) p. 167–73; Puckett, H. W., *Germany's Women Go Forward* (New York 1930) p. 153–55.

GUIRAUD, PAUL (1850–1907), French historian. Guiraud, the favorite pupil of Fustel de Coulanges, continued to reflect both in his seminars at the University of Bordeaux and later at the Sorbonne and in his scholarly writings on antiquity the influence of his distinguished

teacher. Concentrating at first on the purely political phases of Roman history Guiraud shifted gradually to the economic and social history of Greece. In *La propriété foncière en Grèce jusqu'à la conquête romaine* (Paris 1893) he traces the evolution of landed property over a period of ten centuries, discovering three stages, each of which left its traces on civil law. In the first of these stages members of a family held land in common; then with the break up of the large families the land was gradually parceled out; and finally the rise of pauperism, consequent upon this parceling out, was conducive to the establishment once again of large holdings. The rapidity and the thoroughness with which these successive transformations took place varied from city to city, reflecting always the close interdependence between the economic system and the political institutions. *La main-d'œuvre industrielle dans l'ancienne Grèce* (Paris 1900), Guiraud's other outstanding work, traces the somewhat similar evolution of industry. Under the family each member in order to share equally in the common holdings was expected to contribute an equal share of labor. Under the city the attitude toward labor underwent modification. In the aristocracies manual labor was despised. Industry, carried on in small shops with only a slight division of labor, employed in the main slave labor. Although the democratic cities held labor in much higher esteem, their citizens, even the humblest, were so preoccupied with their political prerogatives and with the financial grants accompanying the exercise of them that they much preferred to turn over to the metics or to the slaves the confining responsibilities of a profession or a trade.

Consult: Jullian, C., in *Revue historique*, vol. xciii (1907) 335–26.

GUIZOT, FRANÇOIS PIERRE GUILLAUME (1787–1874), French statesman and historian. Guizot's efforts to reconcile the interests and ideology inherited from the *ancien régime* with the growing forces of democracy make him the most significant representative of the nineteenth century French bourgeoisie. He was descended from a bourgeois family of southern France, deeply devout in its Protestantism.

During his studies at Geneva he assimilated the prevailing philosophical doctrines, which sought to combine the rationalism of the French ideologues with the stern morality of Calvinism, and came at the same time under the influence of German and English writings. He departed for Paris in 1805 with the intention of becoming a lawyer but drifted gradually to literary criticism, then to journalism and finally in 1812 to a professorship of modern history at the Sorbonne. The influence of his colleague Royer-Collard gained for him an appointment in 1814 as secretary general of the Ministry of the Interior, and with only slight inclination of his own Guizot was launched upon a long career which was to make him an outstanding figure in political, intellectual and religious circles. In various governmental capacities under the Restoration government he supported, broadly speaking, a ministerial policy of moderation, although tending after 1820, with the rise of the ultraroyalists, to shift gradually to the left. He became the most erudite and spirited exponent of doctrinaire (*q.v.*) theory and program and as editor of the *Archives philosophiques*, the *Courier* and later the *Globe* and the *Revue française* he formulated even more precisely the political philosophy which in a period of confused theory singled out reason as the basis of sovereignty and capacity as the test for suffrage. His liberal program, which he aggressively defended against reactionary opponents in the period preceding the July revolution, was embodied substantially in the new constitution, and thereafter Guizot became the conservative mouthpiece of the economic interests and doctrines of the new bourgeois regime. He was minister of public instruction from 1832 to 1837 and devoted himself—notably in the inauguration of a system of primary education (1833)—to the task of creating for the newly admitted bourgeois class a broad intellectual and moral foundation as a safeguard against the eventuality, which he dreaded, of its being overturned by a recurrence of eruptive disorders such as those of 1830. As formally recognized head of the government from 1840 to 1848 he was able, both by his congeniality with Louis Philippe and by his prestige in parliament, to assure the smooth functioning of the parliamentary regime and to carry out a foreign policy of peaceful arbitration and colonial expansion. But his growing conservatism and intolerance of any reform overreached themselves and by provoking the Revolution of 1848 brought to an end his political career.

Guizot's methodology as a historian, revealed in *Essais sur l'histoire de France* (Paris 1823, 11th ed. 1866), deeply influenced contemporary historiography. Convinced of the necessity of the critical approach and direct use of original sources, he himself published many texts and chronicles, promoted and subsidized the enterprises of other investigators, organized the work of historical and archaeological scholarship, established or sponsored various new research centers and academic departments and helped found or reestablish a number of learned societies. In addition to being the first scientific historian Guizot was also the founder of the "philosophical school," which emphasized synthesis rather than mere exposition of facts and attempted, often abstractly, to show the dependence of institutional development on social and moral factors. His *Histoire de la révolution d'Angleterre* (2 vols., Paris 1826–27; tr. by W. Hazlitt, London 1846), an even more striking example of this philosophical approach than his earlier and more popular treatises on the history of civilization in France and Europe, has remained a model for subsequent historians. During his years of retirement following 1848 he experienced a resurgence of his earlier spiritual fervor and undertook the series of *Méditations* to reconcile the spirit of modern society with that of Christianity. In the controversy which arose between the orthodox and liberal factions in the French Reformed church Guizot, following a course similar to that which had characterized his earlier political career, became ultimately an uncompromising conservative.

CHARLES H. POUTHAS

Important works: Besides those referred to in the article: *Cours d'histoire moderne*, 6 vols. (Paris 1829–32), section on Europe tr. by W. Hazlitt as *History of Civilization*, 3 vols. (rev. ed. New York 1899); *Histoire des origines du gouvernement représentatif*, 2 vols. (Paris 1851), tr. by A. R. Scoble (London 1861); *Vie, correspondance et écrits de Washington*, 6 vols. (Paris 1839–40), introduction published separately as *Washington* (Paris 1841), tr. by G. S. Hillard (Boston 1840); *Sir Robert Peel* (Paris 1856); *Mémoires pour servir à l'histoire de mon temps*, 8 vols. (Paris 1858–67); *Histoire parlementaire de France*, a collection of his speeches, 5 vols. (Paris 1863); *Histoire de France . . . racontée à mes petits enfants*, 5 vols. GUMFLOWICZ, LUDWIK (1838-1909), Polish sociologist. Gumpłowicz' interest in national, racial and social struggle is intimately associated with the circumstances of his life—his Jewish birth, his participation in the Polish patriotic uprising of 1863 and his career as a socially ostracized professor of law in the University of Graz from 1875 until when, stricken with cancer, he poisoned himself.

Gumpłowicz views the history of civilization as an unending struggle between different elements: first, between the racially distinct primitive groups; then, between the states formed by the stronger groups which have conquered and subjected to themselves the weaker ones; and, ultimately, between the classes inside these states. He was influenced by Darwin's theory of the struggle for existence and Spencer's idea of evolution, which he incorporated into his monistic system. He recognized "syngenism" and "amalgamation" as secondary factors of social life, the former as a natural solidarity which manifests itself in the spontaneous association of individuals into groups; the latter resulting when the conqueror and the conquered become welded together by language, religion and economic interests after protracted struggle.

Gumpłowicz' reputation as one of the founders of sociology is due to his efforts to find the proper field of sociology by dividing it off from all kindred fields, to subject the social process to the same objective investigation as the natural process (in which discussion he adopted Comte's positive method) and to formulate sociological laws. His investigations were practically limited to groups and relations between groups, since he considered the group as the social element. His most prominent disciples were Ratzenhofer, who influenced Albion Small, and Oppenheimer. His works have been translated into many languages and were discussed by the foremost sociologists of his time, such as Ward, Tarde, Durkheim, Vaccaro, Colajanni and Simmel.

GUSTAVUS I (Gustavus Vasa) (1496-1560), king of Sweden. Gustavus was related to the younger Sten Sture, whom he succeeded as leader of the Swedish independence movement. In 1520 he became the active head of the uprising against Christian II of Denmark and received financial aid from the Hanse towns Lübeck and Danzig. He was elected king of Sweden by the diet of Strängnäs in 1523 and was crowned in 1528.

Gustavus Vasa is considered the founder of the modern Swedish state. As a state builder he challenges comparison with the English Tudor kings. During his reign of thirty-seven years he subdued four rebellions by skilfully combining force and oral persuasion; in the Västerås diet of 1527 he secured the assent of nobles, merchants, miners and peasants to measures which placed church property and administration largely in his hands, enabling him to meet his Hanseatic obligations and maintain his regime at home. This was the beginning of the Lutheran Reformation. A series of astutely planned steps completed the change, and the nobles were encouraged to enrich themselves at the expense of the higher clergy, but Gustavus brought them to book and strengthened his hold on burghers and peasants. The Protestant ritual was not introduced until 1544. Although sincerely sympathetic with the Reformation he saw that the wreckage of the old church was a convenient quarry for materials essential to the new state. Lacking trained Swedish officials he brought in Germans, whose efficient but harsh fiscal measures stirred up open discontent. Although up to his death he was deeply suspicious of the Danes he joined forces with Christian III in "the counts' war" in Scania from 1534 to 1536 against his former ally Lübeck and destroyed the Baltic hegemony

of the Hanse towns and their control over Sweden. The impress of his strong personality was reflected in his administration and throughout his voluminous correspondence. He had a suspicious nature, was a severe taskmaster, a shrewd bargainer and withal a man of hard practical sense. He left a strong state and a well filled treasury to his son Erik.

Consult: Hildebrand, E., *Gustav Vasa* (Stockholm 1920); Watson, P. B., *The Swedish Revolution under Gustavus Vasa* (Boston 1889); Hallendorff, C., and Schück, A., *History of Sweden*, tr. from ms. by L. Yapp (Stockholm 1929) p. 110-63; Geijer, E. G., *Svenska folkets historia*, 3 vols. (Örebro 1832-36), tr. by J. H. Turner (London 1845) chs. viii-x; Almqvist, H., *Reformationstiden och stormaktstidens förra skede* (Lund 1922).

GUSTAVUS II (Gustavus Adolphus) (1594-1632), king of Sweden. The bases of the foreign policy of Gustavus Adolphus were the aim to secure control of the Baltic Sea and the waterways leading to it and the desire to establish Protestant supremacy in northern and central Europe. He began his reign with a Danish war from 1611 to 1613; he settled differences with Russia, securing Ingria by the Peace of Stolbova in 1617; and for twelve years he was in nearly constant war with Poland, which, as with Russia, he wished to keep from access to the Baltic. With no ambition to become emperor he aimed to form and lead a German Protestant union, somewhat on Dutch lines, with French aid as an anti-Hapsburg measure, and in 1630 he intervened in the Thirty Years' War.

As a military leader Gustavus Adolphus is significant as the founder of a new art of warfare. His armies had greater mobility, used lighter and more effective weapons, employed more musketry and fewer pikemen, more mobile artillery, smaller infantry units and cavalry squadrons better trained for rapid charges than had obtained hitherto.

Moreover, his interest in Sweden's internal affairs was unceasing. With the help and advice of his chief minister, Oxenstierna, he placed governmental responsibility on the representatives of the four estates and diminished the council's authority. New administrative and judicial organs were formed to care for a state grown increasingly complex. He fostered Sweden's domestic and foreign commerce, granted full privileges for foreign trade to thirteen towns, partial rights to others and practical monopoly of internal trade to the country towns,

despite Stockholm's protests. He dowered the University of Uppsala with fresh resources and founded a university at Dorpat and numerous *gymnasia*.

GUTIÉRREZ, JUAN MARÍA (1809-78), Argentine statesman, educationist and historian. Gutiérrez was co-author as well as an active propagandist of the principles of the Asociación de Mayo, the Argentine reform group, the members of which after the fall of the dictator Rosas played a large part in the reorganization of national life. He participated in the drafting of the basic constitution of 1853. As rector of the University of Buenos Aires from 1861 to 1873 and in similar offices he advocated free education correlated from the primary to the university grades, secondary education preparing for both university and non-university pursuits and university education broad in scope including particularly natural sciences and modern literature. Although these aims were only partially realized, his plan for the reorganization of the university had a considerable influence upon the university administration of the country. Most typical of Gutiérrez, however, is the investigation of literary and cultural production as a means of gaining intimate knowledge of Argentine and Latin American society and of furthering its development. Although he never produced anything but seemingly unrelated monographs and critical writings scattered through periodicals, they offer in the aggregate a fairly complete history of the intellectual activity of the Plata River region from the beginning of its colonization. Written at a time when hardly anything more than political history was produced, they make him the precursor of the historians of national ideas. As profoundly anti-Spanish as he was confident of the cultural development of Latin America, he eagerly sought to discover the intellectual accomplishments of the civilized aborigines and also published the first anthology of Latin American poetry (*América poética*, Buenos Aires 1846).

GUYAU, JEAN MARIE (1854-88), French philosopher. At seventeen Guyau received the degree of *licence ès lettres*, at nineteen he received an award from the Académie des Sciences Morales et Politiques and at twenty he was placed in charge of philosophical studies at the Lycée Condorcet of Paris. Before his early death fourteen years later he wrote several important works on art, morals and religion. It was the social aspects of these phenomena that absorbed him. Reacting from the ethical point of view against the English utilitarians, and from the scientific point of view against the French mechanistic and deterministic school inspired by Taine, Guyau constructed as the metaphysical basis of his thought what might be called a dynamic naturalism. For him all phenomena, not only organic but social, were interpretable only in terms of the principle of life. Life was force and intensity, and within these properties was enveloped a faculty of universal expansion, of self-expression, through the most diverse forms. Hence every individual, far from being by nature an isolated, egoistic entity, was bound by ties of sympathy to all other creatures and achieved completeness only in union with them.

As applied to aesthetics in *Les problèmes de l'esthétique contemporaine* (Paris 1884, 11th ed. 1925) and *L'art au point de vue sociologique*

(Paris 1889, 8th ed. 1909) the philosophy of life became an attack upon the then generally accepted thesis of Schiller and Spencer that art was a manifestation of the play instinct. Guyau's theory, one of the greatest significance in the history of aesthetics and one which through making art a social phenomenon could demonstrate its compatibility with the development of science and industry, represented beauty as the expansion of life revealed by objects when they harmonize the emotions by arousing the feeling of solidarity.

In his principal ethical writings, *La morale d'Épicure* (Paris 1878, 3rd ed. 1886), *La morale anglaise contemporaine* (Paris 1879, 6th ed. 1902), *Esquisse d'une morale sans obligation ni sanction* (Paris 1885, 16th ed. 1921; tr. by G. Kapteyn, London 1898) and *Éducation et hérédité* (Paris 1889, 10th ed. 1908; tr. by W. J. Greenstreet, London 1891), Guyau criticized utilitarianism as failing to explain the transition from egoism to concern for the social good and the Kantian theory as narrowly rationalistic. In fact, according to Guyau moral obligations and sanctions were all superfluous, since morality was merely life manifested in a higher form, achieving its true expression in the spiritual community of men and in love. In the light of this theory the role of education, which must have in view the preservation of the race and the continuation of progress, is to develop the social instinct.

L'irreligion de l'avenir (Paris 1887, 21st ed. 1921; Eng. translation, London 1897) was an attempt to depict religion as a "universal sociological hypothesis" having as its basis the belief that all things could be explained by analogy with human society. Underlying this belief and so underlying all religions is the idea of a social bond, which besides uniting all men with each other links human society as a whole with a world of greater life. When the original content of religion should have become entirely transferred to the separate spheres of ethics, law, philosophy and science and when the non-religion of the future had risen in the place of all positive religions, this fundamental religious idea of an association between all beings of the cosmos would still survive, furnishing as in the past the ideal of humanity and at the same time the basis for its faith in progress. A poet as well as a philosopher, Guyau introduced the lyrical element into French philosophy. It is true that he exercised no direct influence on the evolution of its doctrines but he nevertheless helped to extend its horizons beyond the narrow limits

which had been the penalty of the merely scientific approach.

GUYOT, YVES (1843-1928), French economist and publicist. Yves Guyot was bound by family, education and particularly by the extensive reading of his youth to the liberal and laissez faire tradition of the eighteenth century. When at twenty-one he arrived in Paris to take up his career as publicist he immediately identified himself with the republicans. From that time his militant individualism and his impassioned sense of public service gave unity to a long and varied career. As city councilor of Paris from 1876 to 1885 and in his writings on municipal politics and administration he fought untiringly against all abuse of arbitrary control and power. He was prominent also in national politics, as deputy from 1885 to 1893, as minister of public works from 1889 to 1892 and as political and economic journalist. But he was primarily a prominent economist and savant of his day, stating his economic theory in *La science économique* (Paris 1881; 6th ed. 1928) and writing on such questions of economic policy as the tariff, socialism, the railroads and currency and on such social problems as prostitution and alcohol regulation. But all his writing was unified by a pervasive defense of the liberty of the individual. He did not wish to separate his scientific teachings from his republican and democratic faith. He believed with the physiocrats in the reality of natural economic laws which economic policy could violate only at its peril. These laws he sought to ascertain inductively, but his economic method was actually in the main deductive. In the extreme individualism of his views he is associated with Molinari, and he succeeded Molinari as editor of the *Journal des économistes*, a position which he held from 1909 until his death. A redoubtable polemical writer, he sought to expose the "sophisms" and "economic fallacies" inherent in the socialist criticism of the

prevailing economic system, and the hopelessness of radical programs. He was a consistent free trader and an opponent of government control of industry, wishing to limit state intervention to the minimum required to maintain order.

Defeated as deputy in 1893 on his program of anti-interventionist individualism, Yves Guyot never again entered parliament. That defeat has symbolic value, as it underlines in the French democratic movement the transition from individualistic liberalism, which had dominated the nineteenth century, to the tendency of state intervention. This significant turning point marks the divorce of classical liberalism and contemporary democracy. The conscience of Yves Guyot in this regard never permitted the slightest concession, whence the fine doctrinal unity of his life.

GUZMÁN-BLANCO, ANTONIO (1829-99), Venezuelan statesman. Guzmán-Blanco was the son of Antonio Leocadio Guzmán, one of the founders of the Liberal party and of its famous journal the *Venezolano*. He graduated from the University of Caracas and shortly afterward began his career in the diplomatic and other branches of the public service. He participated in a successful revolution and was rewarded by several cabinet posts and eventually by the vice presidency. His military ability carried him to the provisional presidency in 1870, and for the next nineteen years he dominated the country, despite the fact that he was chief executive during only part of that period.

Although he was vain, arbitrary and capable of augmenting his private fortune at public expense Guzmán-Blanco was nevertheless an able and usually a patriotic administrator. His long rule was marked by peace, material growth and educational progress. He ruthlessly enforced order in Venezuela, often at the expense of liberty. Finances were systematized: the foreign debt was reduced by at least 75 percent despite large loans floated in Europe, and foreign trade and investments increased rapidly. Highways, railroads and telegraphs were constructed; steamship communications with the outside world

were encouraged. Public schools, academies and learned societies were founded and documents bearing upon the history of Venezuela were published at national expense. In foreign relations Guzmán-Blanco favored inter-American cooperation and revealed an enthusiasm for France. He assumed a somewhat defiant attitude toward England over the question of the boundary between his country and British Guiana.

GYPSIES, who live as nomadic groups of one or more families in Europe, the Americas, Asia Minor and Egypt, are found in largest numbers in Rumania, Hungary, the Balkan States, Spain, the United States and England. Their total number has been variously estimated at from 1,800,000 to 4,000,000; it is probably more nearly the former figure than the latter. Whether or not they originally came from central or southeastern India is uncertain. It has been generally accepted, however, that their home immediately prior to their historical trek was the zone of the foothills and plains parallel to the Himalayas and that they migrated northward and westward, reaching Persia about 900 A.D. These original emigrants, called the Bhen, or Bheni, gypsies, divided into two groups: the Bhen, who are the ancestors of the Nawar of Palestine, the Karaci of Asia Minor, the Kurbat of northern Syria and Persia and the Halebi of Egypt; and the Phen, who are the ancestors of the Bosa, or Posa, of Armenia and southern Caucasia and of the Byzantine gypsies, from whom sprang the numerous groups of European and American gypsies. By the end of the fourteenth century gypsies seem to have been established in the Balkan Peninsula, whence many of them were driven into northern and western Europe by the Turkish invasion of the fifteenth century. Throughout most of central and southern Europe they are known by names which are variants of the form *Atsigan*; in France they are also called *Bohemians* and in northern Europe *Tartars*, *Saracens*, *Egyptians* and *heathen*. They call themselves *Rom* in Europe, *Dom* in Syria and *Lom* in Armenia. Their common language,

the only source of information as to their Indian origin, has retained many of its ancient constructions because of the cultural isolation of the gypsies, but the languages of the peoples among whom they have sojourned have contributed markedly to the composition of their vocabulary.

In Europe gypsies have been persecuted wherever they have appeared. Their strangeness and their nomadic habits have led the native populations to accuse them of crimes such as witchcraft, the poisoning of wells and of cattle, the abduction of children and even cannibalism. It is not unlikely that their occupation as smiths and workers in metal contributed toward the fear with which they were regarded by the native populations, for the smith has historically been looked upon with superstitious awe. In the England of Henry VIII gypsies were exposed to the danger of having their goods seized by any justice, sheriff or escheator, who was entitled to keep half for himself and required to turn the other half over to the king's Exchequer. The gypsies were driven out of the country, unless they settled down and exercised a lawful trade or placed themselves in the service of some "honest and able inhabitant." In Poland, Kurland, Lithuania, Hungary and Venice the gypsies were placed in charge of a native nobleman, referred to as the gypsy lord, who had the right to tax them twice a year and to whom they looked for protection. They are said to have had similar status in western Europe but the evidence is insufficient, except perhaps for Scotland, to establish that fact with certainty. They were slaves until they were set free in Hungary in 1781 and in Rumania in 1866.

Their social organization bears evidence of the influences of their nomadism and their isolation. Marriages of near kin, especially of cross cousins, are common, and they seem to have resulted in no physical degeneration. Levirate and sororate are found as well as the prohibition of marriage of a younger sister before the elder. Bride purchase generally prevails except among English gypsies, where the custom of testing the male suitor, particularly as to his prowess and skill, is found. Rumanian and Hungarian gypsies have taken over some of the marriage customs of the native population; a church wedding, however, is as rare with them as it is among English gypsies. The responsibilities of the family rest upon the wife, who through the proceeds from fortune telling is more often able to support it than the husband. This economic basis gives the

gypsy family a matriarchal cast except among the English and perhaps the American gypsies, where the influence of the male seems to be greater than on the continent. Burial customs retain the primitive trait of destroying the property of the deceased person.

The continental gypsies show the remnants of a political organization based on kinship groups; chieftains selected by the groups in turn elect a chief of all the groups—the famous gypsy king of romance. The supreme leader, selected by virtue of his wisdom, impartiality and physical strength functions now only temporarily on the occasion of the meeting of the gypsy tribunal, the Romani Kris, where decisions are made pertaining to the movements of the tribe, the wintering place and cases of the violation of certain tabus. In America the Kris is in addition called upon to decide questions of the repayment of obligations, the annulment of marriages and the return of the bride's purchase price. In America also the leader has often become a sort of padrone who stands between his people and the constituted municipal authorities in cases of transgressions, such as the failure to take out a peddler's license.

Gypsies, especially those of Balkan Europe, are exceptionally skilful as craftsmen, chiefly in copper work; as musicians they have achieved an enviable reputation as performers, particularly with the violin, which they are said to have introduced into Europe. Liszt's contention that all Magyar music is gypsy music has proved untenable. Under modern conditions the men are being compelled to give up their traditional occupations and to resort to casual labor, particularly in farming. In some regions gypsies resort to mendicancy.

The less nomadic among the gypsies may have been weeded out by settling and forsaking the group, leaving those temperamentally unfit for a sedentary life to continue their wanderings. There is also a possibility that they have attracted to their ranks other persons nomadically inclined in spite of the very strong feeling which they possess against marriage with a non-gypsy. The most probable cause for their continuity is found in the fact that they were an outcast group which maintained its internal cohesion, almost in proportion to the pressure of persecution applied to them from without. Now that the animosity against them is gradually subsiding and life under sedentary conditions without stigma has become possible, there is said to be a gradual decline in the gypsy tribal cohesion;

it is probable that they will eventually be completely submerged in the general population.

HAAS, WILHELM (1839-1913), German co-operator. Haas was the son of a teacher in Darmstadt. He became a jurist and until 1900 was in the Hessian government service. Beginning in 1872 he organized and directed numerous Hessian agricultural cooperatives and unions and in 1883 played the chief role in establishing the Reichsverband der Deutschen Landwirtschaftlichen Genossenschaften. This, the largest union of agricultural cooperatives, amalgamated with nearly all other German agricultural cooperatives in 1930. Haas was instrumental in creating the Hessian Chamber of Agriculture, of which he became the first president. In 1881 he became National Liberal deputy in the Hessian second chamber, of which he was president from 1898 to 1911. Later he served as a member of the first chamber. He sat in the German Reichstag from 1898 to 1912.

A pupil of Raiffeisen, Haas made no attempt to develop a distinct ideology as did the former and his adherents, and unlike Raiffeisen he grew up in highly educated urban circles. When he entered the cooperative movement an appeal to the farmers' interests without ideological trimmings was sufficient. Haas took the Schulze-Delitzsch cooperative as a model and was also influenced by liberal and humanitarian currents. His most important accomplishment was in or-

ganization work, in which he was the leader in his field.

Consult: Grünfeld, E., *Das Genossenschaftswesen, volkswirtschaftlich und soziologisch betrachtet*, Handbuch des Genossenschaftswesens, vol. i (Halberstadt 1928) p. 249-53.

HAASE, HUGO (1863-1919), German socialist statesman. By vocation an attorney, Haase joined the Social Democratic party during the period of Bismarck's antisocialist legislation and from 1897 with few interruptions represented Königsberg in the German Reichstag. Beginning in 1904 with the Königsberg trial for high treason, lese majesty against the czar and infraction of the secret society laws, he appeared as defense attorney in numerous important political prosecutions. On the death of Paul Singer he became cochairman of his party with Bebel and upon Bebel's death his successor.

Haase ardently advocated world peace, especially in his address to the Extraordinary International Socialist Congress in 1912. With the French senator d'Estournelles de Constant he was cochairman of the 1913 Franco-German conference of parliamentarians. With Jaurès he led in the final attempt made at the Brussels session of the International Socialist Bureau on July 29, 1914, to effect international workers' action in opposition to war. On the opening of hostilities he advocated peace and the refusal of appropriations for war purposes but accepted the majority socialist decision to support a war of national defense and delivered the party's Reichstag statement in favor of war appropriations on August 4, 1914. In June, 1915, Haase, Eduard Bernstein and Karl Kautsky issued a manifesto, *Das Gebot der Stunde*, warning the party that the war was one of conquest rather than national defense and urging the cessation of support of the government policy. Unable to secure acceptance for his views, Haase in December led a minority of the Social Democratic members of the Reichstag out of the party and in 1917 in conjunction with Ledebour and Dittmann founded the Independent Social Democratic party, which advocated refusal of war credits and favored an early peace without reparations or annexations.

On the outbreak of the revolution on November 9, 1918, Haase became Ebert's cochairman of the council of people's representatives, withdrawing with other representatives of his party late in December. At the Weimar assembly he

favoring signing the peace treaty. Thereafter he resisted attempts at royalist counter-revolution as well as the revolutionary communist policy. He died from an assassin's pistol wound.

HABEAS CORPUS is a common law writ of ancient origin designed to bring about the speedy liberation of an illegally imprisoned individual. Blackstone refers to the writ as the most celebrated in English law. It is essentially a writ of inquiry, directed to the person who is alleged wrongfully to detain a prisoner, commanding him to produce the body of the prisoner before a court or a judge thereof at a designated time and place and to show the cause of the detention. There were originally several varieties of the writ but only one, the writ of habeas corpus *ad subjiciendum*, is of present importance. Since the writ issues in the name of the sovereign power and only upon proper cause shown to the court it is termed a high prerogative writ. It may issue from any court of general jurisdiction or, when the court is not in session, from a judge thereof. The proceeding is usually of a summary character and requires the immediate production of the prisoner before the designated court or judge. The writ of habeas corpus, however, is not designed to operate as a substitute for a writ of error or certiorari.

The origin of the writ of habeas corpus is uncertain. Although it may have antedated Magna Carta (1215), it seems that in the earlier mediaeval period certain other writs designed to protect the liberty of the subject—notably *De homine replegiando*, *Mainprize* and *De odio et atia*—were in more general use, but these gradually fell into disuse after Magna Carta. Traces of the existence of habeas corpus are found in the reign of Edward III (1326-77), and by the time of Henry VI (1422-61) its employment seems to have been common. During the fifteenth century it was used, as an accompaniment of the writ of certiorari, to bring the proceedings in and the parties to an action in an inferior court, before the common law courts. It was also used as an accompaniment to a writ of privilege to release a litigant in one of the central courts of law who had been arrested by the process of an inferior court. It is certain that toward the end of the fifteenth century, when

the rivalry between the courts of common law and the Court of Chancery began, the former made frequent use of habeas corpus to assert their jurisdiction. The extensive employment of the writ by the common law courts resulted in its becoming independent, by the close of the sixteenth century, of both certiorari and privilege. Moreover, habeas corpus *ad respondendum*, the form used when a litigant had a cause of action against one who was confined by the process of some inferior court, came to be distinct from habeas corpus *ad subjiciendum et recipiendum*, the form employed when a person was detained on a criminal charge; and somewhat later the form *ad faciendum et recipiendum* was employed where a defendant in a civil action in an inferior court sought to remove the action into a superior court.

Thus the writ seems to have been utilized exclusively as a procedural device against private restraints and had less to do with constitutional liberties than with the attempts of the courts of common law to defend their jurisdiction, first against the inferior courts and later against the Chancery. But during the reign of Henry VII (1485-1509) occur the first instances of attempts to employ it as a constitutional remedy against the crown in the application of habeas corpus *ad subjiciendum* to persons committed to prison by the Privy Council. When so used it came to be associated with the inhibition of Magna Carta against imprisonment without due process of law. In other words, the writ was being employed, during the early Tudor period, when the powers of Parliament were undefined and the judges were under the crown's domination, to make effective the guaranties of Magna Carta.

Nevertheless, in the Stuart period the judges decided in Darnel's case [3 Howell St. Tr. I (1627)] that a return to a writ of habeas corpus which set forth that the prisoner was detained by warrant of the Privy Council was a sufficient answer to the writ. Parliament thereupon sought to remedy the situation by the Petition of Right [3 Car. I (1627)]. The act of 1641 abolishing the Star Chamber provided that if any person were imprisoned by any court exercising a jurisdiction similar to that of the Star Chamber or by the command of the king or of his Privy Council he should have granted unto him without delay, upon motion to the Court of King's Bench or Common Pleas, a writ of habeas corpus; the court was required within three days after the return to examine and determine the legality of such commitment (16 Car. I, c. 10). This act

was to a large extent rendered nugatory by the refusal of the judges to issue the writ during vacation. In 1676, for example, one Jenkes was committed by the king for an alleged seditious speech and both the chancellor and chief justice refused to grant the writ in vacation. Shortly after this case Parliament passed the famous Habeas Corpus Act (31 Car. II, c. 2, 1679), which not only authorized the issuance and hearing of the writ without regard to terms of court but imposed severe penalties on any judge who refused without good cause to entertain it and upon any officer or other person who failed to comply with it. It was the most powerful weapon yet devised for the protection of the liberty of the subject, not because it gave new rights but because it provided such an efficacious remedy for those already in existence. No order of the crown could thereafter be relied upon as superior to the authority of the court. The act was defective, however, in that it applied only to cases of commitment on charge of crime; in 1816 it was amended so as to extend to all cases of illegal confinement (56 Geo. III, c. 100).

The remedy of habeas corpus has been recognized and preserved in the United States by constitutional provisions and by various statutes reenacting and amplifying the essential provisions of the English act. The federal constitution (art. I, sect. 9, subdiv. 2) provides that "the privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it," and the constitutions of most of the states contain provisions of a similar nature. In a few states the suspension of the writ in any case is forbidden. At the present time the law with respect to habeas corpus has been reduced to statutory form to increase its efficiency. As in England, habeas corpus is available to contest detention by public or private authority.

In England the writ has been suspended several times: by annual acts from 1794 to 1801 and again in 1817. In the United States President Lincoln suspended it by executive proclamation in 1861. Chief Justice Taney of the Supreme Court expressed the opinion that Congress alone possessed this power under the constitution [*Ex parte Merryman*, Fed. Cas. no. 9487 (1861)]; and his view has been generally accepted as correct, although Lincoln's position was defended by leading constitutional lawyers of his day. Later, in 1863, Congress authorized the president to suspend the writ whenever in his judgment the public safety might require it.

Under the provisions of this act a partial suspension took place, but it was held that the suspension of the privilege did not justify the courts in refusing to issue the writ but only suspended its further operation. In the famous *Milligan Case* a majority of the Supreme Court held that in a state where the civil courts were in full operation and the federal government was unopposed, trial by a military commission could not constitutionally be substituted for civil trial, nor could the privilege of the writ be suspended in such a state. The remaining justices held that Congress had not in fact made provision for the military tribunal in question, but maintained that it possessed the power to do so if it saw fit [*Ex parte Milligan*, 71 U. S. 2 (1866)]. The power of suspension has never been exercised by the legislature of any state except that of Massachusetts, which suspended the privilege of the writ from November, 1786, to July, 1787, on the occasion of Shays' Rebellion. The Confederate States suspended the privilege during the Civil War. But it should be noted that state supreme courts in Colorado, Idaho, Pennsylvania and West Virginia have gone far in denying all recourse to habeas corpus when state executives have declared martial law during strikes.

The jurisdiction of the federal courts in habeas corpus proceedings is prescribed by several acts of Congress. In 1833, as a result of the nullification controversy in South Carolina, Congress authorized federal courts to inquire into any commitment for an act done in pursuance of a law of the United States. In 1847 the power was extended to all cases where a person was restrained in violation of the constitution, laws or treaties of the United States. Thus the writ is available whenever a person is imprisoned by state authority in violation of federal right [*Ex parte Royall*, 117 U. S. 241 (1886); *Ex parte Yarbrough*, 110 U. S. 651 (1884)]. But the issuing of the writ is discretionary and it will not be used so as to obstruct the ordinary administration of the criminal laws of the state through its own courts. The power to issue writs of habeas corpus is expressly given to the Supreme Court of the United States but it will use this power only in its appellate character except in cases affecting ambassadors, other public ministers or consuls and those to which a state is party. Unless special circumstances are shown, the Supreme Court will not issue the writ where application might be made to a lower federal court [*Ex parte Mirzan*, 119 U. S. 584 (1887)]. A state court has no authority to issue a writ

for the discharge of a person held under the authority or claim and color of the authority of the United States by an officer of that government [*Tarble's Case*, 80 U. S. 397 (1871)].

Habeas corpus is employed in connection with a wide variety of miscellaneous matters, as, for instance, the passing upon the validity of international extradition or interstate rendition proceedings; the securing of the release of one illegally in the custody of the military or naval authorities; the testing of the jurisdiction of a court in committing a person for contempt; the reviewing of proceedings for the deportation or exclusion of aliens; the determining of the lawfulness of the detention of a person arrested in a civil action under mesne process or under execution against the person; the questioning of the legality of the detention of one held under quarantine or health regulations; the examining of excessiveness of bail in either a criminal or civil action; or the inquiring whether a prisoner committed to an institution after an acquittal of crime because of insanity is entitled to release. It is in connection with cases of this sort, particularly where the petitioner is granted a jury trial on the writ, that many abuses occur. Indeed the growing frequency of the use of habeas corpus in criminal prosecutions for the purpose of delaying the disposition of cases has contributed in no small degree to the ineffectiveness of the administration of justice in the United States. In England the writ issues in a centralized court system. But in the United States the fact that it may issue from a multiplicity of state and federal courts and from judges often amenable to sinister political influence has given rise to considerable adverse criticism and led to a demand in some quarters for legislation designed to restrict its uses in the administration of the criminal law.

In continental countries rights of personal liberty are formulated in constitutional guarantees but no procedure analogous to the Anglo-Saxon habeas corpus is available. The supremacy of the administration excludes it. The protection against arbitrary imprisonment depends primarily upon the provisions of the codes of criminal procedure which govern the actions of the police and judicial authorities, and it is by the adequacy of these procedural guarantees that the security of the individual must be judged. Their violation entails criminal responsibility of various degrees of severity in different countries. In this respect the continental system is repressive where the Anglo-American system attempts

to be preventive. Probably in the last analysis, however, individual liberty in continental countries, as in many modern constitutional states, depends upon the degree of independence of the judiciary and the responsibility of the administration. This is certainly borne out by the early history of habeas corpus in England.

The procedure of habeas corpus has led to a great deal of envy on the part of continental jurists, who have been shocked by instances of arbitrary imprisonment in their own countries; but probably they have romanticized the Anglo-Saxon institution as much as the Anglo-Saxon has tended to regard the European as the helpless victim of a bureaucratic state. The frequent lawlessness of American police officials would certainly seem to indicate that while habeas corpus is undoubtedly the most effective remedy yet devised against the dangers of unlawful imprisonment its operation is not always so automatic as the books make it appear. Probably the best proof of this is the situation in South American countries. Most of the larger and more important countries—Argentina, Brazil, Chile and Peru—have adopted the writ without even changing its name (*auto de habeas corpus*). In Argentina the writ is statutory but in the other countries it is constitutional. In Mexico the *amparo*, a writ of injunction, performs among other functions that of habeas corpus. But one hardly needs to read the complaints of Latin American publicists to suspect that habeas corpus is too often honored in the breach rather than in the observance. The habits of dictatorship undermine the supposed legal remedy.

In continental and Latin American countries the rights of personal liberty which are dependent upon constitutional guaranties may be suspended in time of war or domestic insurrection by the proclamation of a "state of siege." Civil authority may be displaced by the military and constitutional rights may be disregarded without fear of subsequent legal redress, although the actual displacement of the civil tribunals depends upon the extent of the emergency. While in some respects similar to the "suspension of constitutional guaranties," the suspension of the writ of habeas corpus has the sole legal effect of allowing the executive to defer the trials of persons charged with certain offenses during the period of the emergency. No new body of law is brought into operation and no constitutional rights are abrogated. If after the privilege of the writ has been restored it is shown that the imprisonment was legally unjustified, those re-

sponsible can be subjected to civil and criminal liability.

HABIT. Habit is recurrent behavior not determined by heredity. This definition involves difficulties which are inherent in the concept itself. Organisms are never free from environmental influences, so that all conduct is a product of both inheritance and learning. Such considerations force a recognition of the relativity of the distinction between instinct and habit; habit is merely the relatively stereotyped aspect of conduct which bears relatively obvious imprints of the individual's life history.

Even the protozoa show a slight capacity for habit formation. In higher forms habit is chiefly dependent upon the brain; animals deprived of the cerebral hemisphere show very little learning. The brain may be regarded as a center for the formation of new connections between stimuli and responses. Brain injuries frequently destroy much of what has been learned and interfere with the ability to learn new things. It has been customary to regard learning as a matter of establishing new pathways within the brain and accordingly to consider the shifting of stimuli to new responses as a functional correlate of a

changed line of least resistance. Some experimental work has seemed to challenge this concept of the specific pathway for habit, but it has not substituted for it any definite conception of the nature of that shift in stimulus-response connections to which the term learning is applied.

The long and crowded history of theories of habit points to the immense significance attached to the problem. Hobbes in 1650 regarded habit as the tendency for one form of motion in the body to set going another. This was made more precise in 1749 by Hartley, who noting Newton's laws of the pendulum and Locke's "association of ideas" postulated that every higher mental process is a habit based upon the previous concurrent excitation of two or more brain areas. The resulting associationism became the dominant psychology of England. The education of John Stuart Mill is the classical instance of putting into practise the doctrine that the mind is simply a pattern of habits. The middle of the nineteenth century witnessed a sharp reassertion of the importance of instinct, since the doctrine of evolution meant the dominance of biological concepts which made man similar to the irrational and impulsive ancestors from whom he was held to be descended. Emphasis upon instinct was accompanied by Galton's studies of apparently innate individual differences in intelligence. Psychology in these years had its roots far more deeply in the biological than in the social sciences and came therefore to emphasize inherited individual differences.

About 1900 the experiments of Russian physiologists laid emphasis upon a form of learning which has seemed in some ways more fundamental than the associations previously emphasized. The concept of the conditioned reflex (*q.v.*) seemed a clue to the direct attachment of emotional and other socially important responses to stimuli which would not originally bring them out. Thus a racial antagonism might have its origin in some strongly emotional experience of childhood. Such conditioning experiences in childhood may be forgotten yet may function in a uniform way, not only in response to the stimulus which was originally concerned but in response to any which is similar to it; this is known as a transferred conditioned response. In this way antipathy to all Negroes might arise as a result of a bad fright from one.

The complexity of the human organism suggests that the transition from the reflex behavior of the infant to the integrated conduct of the

adult consists largely of the formation of habits. This is sometimes put forward as a sociological view as contrasted with what is known as the biological view, which traces all human conduct to the driving power of instinctive factors. Both statements are inadequate. A habit can never be formed except out of the raw material provided by innate responses and disappears if at any time the innately provided mechanism of the habit is destroyed, while the biological statement assumes that an instinctive entity which has been shaped and redefined during the span of life is in some way identical with the primitive quasi-mechanical response of infancy. Nevertheless, both views are valuable as working hypotheses when stated in the following form: not only the stimuli which call out instinctive responses but the very patterns of the instinctive responses themselves reflect the culture of which the individual is a part, while on the other hand certain basic organic needs are found in all human beings and despite variations in culture they express themselves in more or less similar form.

Since most innate responses seem capable of being conditioned, it is possible to schematize the entire structure of adult personality as a bundle of habits. The only true unity which personality would have on this basis would be traceable to such processes as the transferred conditioned response and to certain generalized physiological characteristics such as speed and strength; the former processes would be the more important. To be sure, one situation may call out simultaneously two or more responses (in so far as these are not physiologically antagonistic) and these groups of simultaneous responses to particular situations may come in time to comprise everything from a mannerism to a philosophy of life. Probably all later habits in human beings are to a considerable degree to be regarded as modifications of habits established in childhood. The latter tend to be techniques for satisfying wants and to be blindly carried over from one situation to another as the child grows older. Early habits may, on account of the child's lack of insight and relative helplessness in complicated social situations, prevent him from establishing in each new situation habits which could be built if previous habits were absent. The synthesis may sometimes, however, be broken down by new learning. Such a view is contrasted with the type theory, the conception of personality as a system of relations between traits, each one of which is so inter-

locked with the rest that none may be regarded as an independent variable.

Education may be conceived as a method for building habits from the raw material which nature provides; or, stated more broadly, it may be conceived as the task of eliminating certain responses and attaching other responses to stimuli which do not by nature evoke them. Educators have long explicitly recognized that a sound psychology of habits is essential to their work. The English associationists and the Herbartians in Germany were prominent exponents of the view that education is not merely the forming of associations but the arrangement of the educational program in such a way that each step would make use of the organized system of habits already achieved by the child. Since there is no sharp distinction between the learning of facts, of skills and of moral habits, such a theory of education is based upon a unitary theory of habit. In the same vein criminologists assert that the task of eliminating crime involves not merely the setting up of penalties but training which will so organize the entire personality in relation to acceptable goals that the incentive toward crime is unable to compete successfully with the existing habit organization.

Social control of all forms presupposes the relative dependability of human conduct and finds habit the basis for continuity in both personality and the social structure. Social control usually involves also some changing of habits but only within rather narrow limits, and the fixity of one group of habits is presupposed when the alteration of another group is attempted. It is not enough for the advertiser to know that the habit of fearing bacteria has become widespread; it is important to know what particular habits with reference to sanitation and cleanliness already prevail among the group which he wishes to reach. Propaganda, because in general its result must be prompt and extreme and because as a rule it is directed to a more heterogeneous population than that addressed by the advertiser, has to resort to more primitive emotional responses, those which can be presupposed as the universal property of all individuals addressed. When, however, either advertising or propaganda has worked sentiment to a certain pitch, one assumes that it has already formed new attitudes and that from this point on it is necessary only to prevent the incursion of interfering habits. But here too there is more than habit, since it is hard for an individual to admit that a stand once definitely taken is unwarranted.

Among habit forming agencies the newspaper and radio may be regarded as vehicles of propaganda as well as of information. Editors recognize the difficulty of sudden shifts of policy no matter how imperatively social conditions may demand a change; the reader must feel that the essentials of the policy remain unchanged. Schools are usually granted an even more important place in habit formation; yet they are ordinarily regarded as concerned chiefly with cognitive and motor habits, while the family is responsible for emotional and moral habits. Not only because of the great responsibility thus given it but because of the strength of emotional responses which survive from childhood into the adult period the family must be considered to be in western Europe and the United States the most important of habit forming institutions.

An inquiry into habit formation in individuals must confront the problem of imitation. The term imitation covers several distinct groups of psychological facts, but all of these may be shown to be capable of definition partly or entirely in terms of the principles of habit formation. Imitation serves among many species as a basis for the continuation of habits and traditions which the young take over from their parents. All birds and mammals have traditions; the young learn the ways of the old. They learn not only the techniques upon which food and escape from danger depend; they learn ways of avoiding collective disapproval in a manner similar to human response to ethical instruction. Just as punishment substitutes a withdrawing reaction for an approach reaction, so, by conditioning, the threat or scowl deters, until with repetition the symbols which may prove effective to restrain antisocial conduct may be but remotely related to those originally necessary. Again, primitive imitative tendencies in man tend to enlarge condemnation by a few into collective condemnation by all members of the group; what was once offense against an individual becomes in time the grave infraction of a social tabu. The interdependence between members of groups is so great that such codes may be maintained even during long periods of subjection by alien rulers. The analogy between habits and customs can, however, be overdone, since the continuity of personality is in the long run safeguarded more substantially than is the continuity of the ways of the group. Radical changes in adult personality are, except in case of mental disease, infrequent; radical changes in customs are commonplace, even when the

period during which such changes take place is shorter than the lifetime of an individual.

So too the child's acquisition of social habits and acceptance of group traditions are sometimes assumed to have a dynamic character and to guarantee social continuity exactly as instinct might guarantee it. Under conditions of absolute isolation this sometimes seems to be true, but under conditions of culture contact learned elements are much more likely to collapse than those relatively fixed by heredity. Customs moreover never operate mechanically, independent of the needs which they serve. The social inheritance of habit formation is then only superficially identical with the inheritance of an organic need.

Tradition has already been described as a mode of restraint, instrumental not merely for the inculcation of safe and dependable social ways but as a stabilizer of the social structure. Considerable discomfort is involved in breaking almost any habit, and the discomfort is multiplied when vigorous emotional responses rather than mere techniques are involved. In this way changes in basic ethical and religious customs tend to be slower and to encounter more resistance than changes in mere motor habits. The restraining effect of tradition, however, is largely due to the direct and unthinking condemnation of acts apparently in conflict with individual or social interest. The genuine importance of habit as a social stabilizer appears then not to reside so much in the sheer painfulness of forming new habits as in the attitude of condemning what one has condemned since childhood. Conservatism involves of course many factors besides habit—for example, the deliberate or half deliberate preservation of vested interests—but it must be conceded that the intense conservatism of many groups seems to have its origin in the conditioned response type of attitude toward new ideas or practises.

Boehm (Baltimore 1929); Dumont, Léon, "De l'habitude" in *Revue philosophique de la France et de l'étranger*, vol. i (1876) 321-66.

HADLEY, ARTHUR TWINING (1856-1930), American economist, political theorist and educator. From an academic family environment and a Yale training Hadley went to Germany, where he studied for two years (1877-79) under Adolf Wagner at the University of Berlin. He returned to a career of Yale teaching somewhat affected by the historical approach in economics and especially by the work of Knies, Cohn and Sax on transportation. His first book, *Railroad Transportation: Its History and Its Laws* (New York 1885), was notable for its use of the comparative method, its clarification of the theory of railroad rates and its orientation in regard to the question of state interference. Hadley had become acquainted with the state socialist position in his studies with Wagner, but his own conclusion was in favor of the maintenance of the individualistic principle bolstered by the development of responsibility within the industry. This view was retained and strengthened in the course of Hadley's subsequent contacts with the railroads: in his testimony before the Cullom committee on the Interstate Commerce Act (1885); his experience as associate editor of the *Railroad Gazette* (1887-89); and his service as chairman of the Railroad Securities Commission created by the Mann-Elkins Act (1910), whose work foreshadowed the Railroad Valuation Act of 1913. Hadley further explored the problem of the province of government in his second book, *Economics: an Account of the Relations between Private Property and Public Welfare* (New York 1896). In scope and emphasis this general exposition of economics responded less to the prevalent interest in marginal introspective theory than it did to the intense economic stress of the period. Hadley wrote it at a time when the exploitation of national wealth under private property was being increasingly challenged, while Populism on the one hand and socialism on the other were attacking capitalist enterprise. Although a textbook in form this work was in reality as intelligent an apologia and as judicious a defense of the economic institutions of the day as the American literature contains. Its approach

was not from a theory of distribution, as was, for example, J. B. Clark's, but rather from what Hadley called a theory of prosperity. Conceding imperfections in the existing organization of economic individualism Hadley regarded them as departures from a norm or an ideal which in itself represented a tremendous advance in human history.

Hadley was now led by the logic of his position from an economic to a preponderantly ethical and political approach. He had to reconcile his reluctance to admit radical social change with his rather realistic perception of the extent to which the institutions of competition and representative government had broken down. He was first forced into denying the importance of all institutional constructions, asserting that men are saved "less by their institutions than by their characters" and treating institutions as merely scaffolding or machinery. Seeking some ultimate base for his thought—an *inconsummum quid* on which it could come to rest—he found it in the standards of morality and the public spirit which give substance to the scaffolding of institutions and furnish the power for the administrative machinery (*The Relation between Freedom and Responsibility in the Evolution of Democratic Government*, New York 1903; *Standards of Public Morality*, New York 1907).

Hadley's investigation in what we may call the dynamics of institutions took two directions. He studied the wheels and pulleys of the actual controls in society (*Undercurrents in American Politics*, New Haven 1915). In another direction and in a more hortatory mood he considered how these controls might be ethicized through the education of public opinion. This was his principal concern in all his writings and in his tenure as president of Yale University (1899-1921). His theory of education oscillated between the principle of freedom and the principle of responsibility as between two poles. On the whole, however, as a true follower of the Tory tradition of Burke, Alexander Hamilton and Walter Bagehot, his sympathies lay with social cohesion rather than with individual freedom, with tradition rather than with innovation. The worst form of irresponsibility was to Hadley's mind the pushing forward of the interests of a class or group to the detriment of the interests of the community (*Economic Problems of Democracy*, New York 1923). In his presidential addresses before the American Economic Association in 1898 and 1899 he advanced the thesis that since political representation had become

particularistic the true function of the economist lay in representing the widest interests of the public. A rejoinder by John R. Commons emphasizing the essential class basis of prevalent economic conceptions was an indication of the body of thought that was coming increasingly to challenge the thought for which Hadley stood.

Consult: Fisher, I., Raper, C. L., and Seligman, E. R. A., in *American Economic Review*, vol. xx (1930) 364-68; Fisher, I., in *Economic Journal*, vol. xl (1930) 526-33.

HAECKEL, ERNST (1834-1919), German biologist and philosopher. After studying with Johannes Müller, Virchow and Gegenbauer and after a biological expedition to Sicily Haeckel was appointed to a professorship of zoology at the University of Jena, which he held until 1909. His best known contribution to biology is his evolutionary interpretation of von Baer's biogenetic law. He contended that ontogeny is the epitome of phylogeny, that the individual recapitulates during the rapid and short course of its development the most important form changes which its ancestors traversed during the long and slow course of palaeontological evolution. On the basis of this theory he arranged coexisting species in temporal succession in the form of a genealogical tree. These views are still the basis of much controversy; none the less they initiated the modern movement in comparative anatomy which stresses the utmost importance of comparative embryology. His recapitulation theory stimulated the evolutionary study of human culture, especially the approach to the study of primitive cultures and prehistoric periods which attempts a task of arranging existing forms into historical stages. It also influenced educational theory in the United States through the work of G. Stanley Hall, who proposed that child education be organized around the idea that a child must pass in epitome through the cultural periods of man's evolution just as the child in embryo repeated human biological history. Haeckel also propounded the gastraea and coelom theories of cell development which in a modified form remain the basis of the classificatory arrangement of multicellular animals. He was the outstanding apostle of Darwinism in Germany and bore the brunt of the violent attacks of its opponents.

Haeckel based his monistic system of philosophy upon his biological doctrines. He attempted to establish a scientific naturalistic view of the

world as well as a non-religious system of ethics. He regarded psychology as a branch of physiology and psychical activity as depending solely on physiological changes in the protoplasm of the organism and denied the immortality of the soul, the freedom of will and the existence of a personal God. His presentation had glaring inconsistencies; for example, his assertions that atoms have souls and that crystals have organic life. Monism as founded by Haeckel has had very wide popular support in Germany and to a lesser degree in other countries. It influenced among others Lester Ward, who was the first to popularize Haeckel's work in the United States.

HAGEN, KARL HEINRICH (1785-1856), German economist. Hagen studied under Hoffmann and was subsequently professor of economics and technology at Königsberg. He was strongly influenced by the teachings of Adam Smith, and his book *Von der Staatslehre und von der Vorbereitung zum Dienste in der Staatsverwaltung* (Königsberg 1839, tr. by J. Prince-Smith as *System of Political Economy*, London 1844) is an attempt to apply the classical doctrines to the range of problems of old cameralism. Hagen's chief contribution, however, was his theory of foreign trade, elaborated in *Die Notwendigkeit der Handelsfreiheit für das Nationaleinkommen mathematisch nachgewiesen* (Königsberg 1844). This work, written under the influence of Cournot's *Recherches sur les principes mathématiques de la théorie de richesses* (Paris 1838), presents one of the earliest attempts in German economic literature to apply the mathematical method to economic analysis. It attracted international attention and still merits consideration as an attempt at exact analysis and measurement of the effects of export and import duties with a view to formulating a national commercial policy. Hagen concluded that im-

ports are always advantageous; exports, only under certain circumstances. Consequently import duties as well as export bounties are injurious. The opinion, occasionally expressed, that Hagen considered import duties advantageous under certain conditions is erroneous.

HAGGARD, SIR HENRY RIDER (1856-1925), English novelist and agrarian reformer. At the age of nineteen Haggard went to South Africa, where he remained except for brief trips until 1881, serving for a time as master of the Transvaal High Court. Apart from his legal activity his main interests there centered upon aspects of native life, later reflected in his novels *King Solomon's Mines* (1885), *She* (1886) and *Ayesha* (1905). After his return to England, feeling the desire to do something "more practical than the mere invention of romance upon romance," he turned his attention to the state of English agriculture and the rural population. He believed that one of the gravest problems that England faced was the rapid depopulation of rural districts. In 1899 he published *A Farmer's Year* (London) and this was followed by *Rural England* (2 vols., London 1902), an admirable survey of agricultural conditions based on a journey through twenty-seven counties of England. In 1905 as an appointee of the Colonial Office he also traveled in the United States and Canada to study the labor colonies founded by the Salvation Army. Subsequently he devoted himself almost exclusively to the social aspects of agrarianism. Visits to Denmark (*Rural Denmark and Its Lessons*, London 1911; rev. ed. 1913) and, during the World War, to all the British dominions for the purpose of collecting information about the future settlement of ex-soldiers occupied much of his time, and membership on royal commissions on labor, afforestation and coast erosion familiarized him with the opportunities for extending the amenities of rural life. Haggard's importance in agrarian reform lay not so much in any original approach to the problems involved or in any conspicuous success as in his great energy in studying and stating the conditions of rural life.

HAGUE CONFERENCES. Although many international conferences have been held at The Hague in modern times, the term Hague conferences is generally applied to the International Peace Conference of 1899 and the Second International Peace Conference of 1907. After the lapse of a generation a high estimate must be placed on the importance of these conferences. They represented the only united effort which was made to deal with the general situation that led to war in 1914; they made a significant contribution to international legislation; and by achieving a measure of continuity and by establishing the Permanent Court of Arbitration (*q.v.*) they helped to pave the way for later international organization in the League of Nations and the Permanent Court of International Justice.

The Peace Conference of 1899 owed its origin to proposals made in August and December, 1898, by Count Muraviev in the name of the czar of Russia. The original proposal with its lofty and seemingly disinterested anxiety regarding the peace of the world was not universally accepted at its face value. After four months Count Muraviev deploring a turn for the worse in the political outlook of Europe issued a second note, in which the original vague allusion to "possible reduction of armaments" was replaced by a more precise recommendation for a limited military and naval holiday and by a definitive program of eight points, beyond which the projected conference should have no jurisdiction and from which were excluded "all questions which concern the political relations of states or the order of things established by treaties." The response to the second proposal was more satisfactory. Because of the obvious undesirability of holding the conference in the capital of one of the Great Powers it was decided that it should be held at The Hague; invitations were issued on April 6, 1899, by the Netherlands minister of foreign affairs to those governments which had diplomatic representatives at St. Petersburg and to Luxemburg, Montenegro and Siam. On May 18 one hundred and one representatives of twenty-six states convened at the House in the Woods, where during nine weeks they attempted with some measure of success to convert the rhetoric of idealism into binding international conventions.

Vague suggestions of a second conference were made in 1899, but events following the adjournment of the first conference, more particularly the South African and Russo-Japanese

wars, tended to darken the prospects for a resumption of the effort. Despite the spirit of disillusionment prevailing in some quarters, however, a resolution was adopted by the Interparliamentary Union at St. Louis on September 13, 1904, calling for a second conference. This resolution led President Roosevelt to urge "pushing forward toward completion the work already begun at The Hague." On October 21, 1904, Secretary Hay directed the representatives of the United States to ascertain whether other governments were prepared to act in this sense, and he received numerous affirmative replies. The conclusion of the Russo-Japanese War created a more favorable atmosphere; and on September 13, 1905, a few days after the signing of the Treaty of Portsmouth the Russian government assumed the initiative of calling the second conference, the date of which was set after some delay for 1907. In addition to the twenty-six nations represented in 1899 nineteen Latin American countries were now invited along with Ethiopia and Korea. States which had not been represented at the conference of 1899 had not become parties to the Convention for the Pacific Settlement of International Disputes of July 29, 1899, which was a closed convention in the sense that it was not opened to signature by all states; to remedy this a protocol was signed on June 14, 1907, by representatives of the states which had been represented at the first conference; and on June 15, 1907, or soon thereafter seventeen Latin American states adhered to the convention. The second conference was held from June 15 to October 18, 1907, with forty-four states represented. The work was mainly done in the four commissions and the six sub-commissions deliberating behind closed doors.

The major objectives originally formulated by the czar proved to be beyond the realm of practical accomplishment in either conference. The more important governments remained suspicious of any thoroughgoing limitation of armaments and were reluctant to make any real concession of national sovereignty to the principle of compulsory arbitration. Resolutions and *vœux* incorporated in the final acts of both conferences commemorated the intrinsic merit of these principles; but neither conference was able to incorporate them into formal conventions or signed declarations. In 1899 the limitation of armaments was declared to be *grandement désirable* and in 1907 *hautement désirable*. Despite the efforts of the American and British delegations in the second conference to carry through a

convention on compulsory arbitration, the conference was forced to content itself with reechoing the non-committal assertion of its predecessor that compulsory arbitration was commendable in principle, with a slightly more specific declaration "that certain disputes, in particular those relating to the interpretation and application of the provisions of international agreements, may be submitted to obligatory arbitration." The 1907 convention (xii) providing for an international prize court failed to secure a single ratification, a fate which likewise befell the Declaration of London of 1909 (*q.v.*) and the 1910 protocol designed to implement the original convention.

On the other hand, the permanent gains embodied in the three conventions of the first conference and in the thirteen conventions of the second may be regarded as more genuinely significant than the failures enshrined in the resolutions and *vœux*. Although compulsory arbitration was not made obligatory, the permanent machinery for promoting optional arbitration set up by the convention (i) of the 1899 conference, which was expanded and revised by the convention (i) of 1907, represented a significant step forward in the direction of international organization. These conventions also contributed greatly to clarifying the principles and procedure for good offices and mediation.

The labors of the two conferences also resulted in a valuable restatement of the somewhat inchoate laws of war and maritime neutrality. The lines of this development had been sketched in the Declaration of Paris of 1854, the Geneva Convention of 1864 and the St. Petersburg Declaration of 1868 and by the inconclusive Brussels Conference of 1874. The second and third conventions of the first conference, designed to eliminate in so far as possible unnecessary suffering on the part of combatants, non-combatants, neutrals and citizens of occupied territories, were supplemented by three declarations, binding for a period of five years, which proscribed aerial bombardment, asphyxiating gases and expanding bullets. Most of the conventions of the second conference concerned themselves with ramifications of the broad problems blocked out in 1899; the revision of the two earlier conventions and the extension of the earlier declaration regarding aerial bombardment "for a period extending to the close of the third peace conference" were accompanied by an exhaustive, ground breaking codification of principles governing the outbreak of hostilities, the rights and

duties of neutrals on both land and sea, the status of enemy merchant ships at the outbreak of hostilities, the conversion of merchant ships into warships, the laying of automatic submarine contact mines, bombardment by naval forces in time of war and the exercise of the right of capture in naval warfare.

A striking feature of the Hague conferences was their effectiveness in pushing through the adoption of binding international conventions by a large number of states throughout the world. Two of the conventions signed at the first conference were ratified almost immediately by the twenty-six signatories, while that regulating the laws and customs of war on land received twenty-three prompt ratifications and three subsequent adhesions. The percentage of ratifications of the 1907 conventions was somewhat lower, attributable primarily to the post-conference indifference of the Latin American group and to the later coolness of the states of southern Europe. The great majority of the conventions averaged around 60 percent of ratifications, going as high as 70 percent in the case of the convention relating to the opening of hostilities, as low as 50 percent in the case of the convention prohibiting the forcible collection of contractual debts and to zero in the case of the International Prize Court Convention. In addition to the provisions for ratification provision was also made, subject to certain limitations, for subsequent adhesion by non-signatory states, either those which had not signed at the conference or those which had not participated in formulating the conventions. Since 1919 several of the new European states have adhered to several of the conventions. Provision was made for reservations both in signing and ratifying. No explicit sanctions were set down in the 1899 conventions, but in the later revision of the convention regarding the laws and customs of war on land money penalties are prescribed in certain cases of violation. Should a state desire to abrogate its responsibilities under a particular convention, it is permitted to denounce the convention. Where an 1899 convention was revised by the second conference it was held to be superseded as between the parties by the later convention; but certain states which ratified the earlier conventions failed to ratify the later ones, so that a particular state may be bound by both conventions, *vis-à-vis* different states. Thus the United States and France are bound *inter se* by the convention of 1907 regarding the pacific settlement of international disputes, yet each of them is

bound to Great Britain and to Italy by the corresponding convention of 1899. Many of the conventions contain provisions limiting their application to a war in which all the belligerents are parties to the convention—a condition which was not fulfilled in the World War, since six of the nations involved, including Italy and Turkey, had failed to ratify any of the 1907 conventions. It is significant, however, that despite this weakness the conventions exerted a profound moral influence on the conduct of belligerents during the war, and they remain in force in spite of the war.

The Final Act of the 1907 conference contained a recommendation that a third conference should be held within eight years and that two years in advance a committee should be set up to make a thorough preparation. The Netherlands government took this recommendation seriously and soon began its own preparation for a third conference. It was commonly expected that a third conference would be held in 1915; but on June 22, 1914, when it was evident that preparations had not proceeded sufficiently, the government of the United States proposed the postponement of the conference to 1916. The outbreak of war in 1914 blasted the hopes for a third conference; and although a few people may have wished to revive the series in 1919, interest was then turned in a different direction. The place of the Hague conferences is now filled by the Assembly of the League of Nations, which meets, not at intervals of eight years, but annually. The most important contribution of the Hague conferences was the idea of a continuous dealing with international affairs through successive conferences.

HAGUE TRIBUNAL. *See* PERMANENT COURT OF ARBITRATION.

HAHN, EDUARD (1856-1928), German geographer and economic historian. Hahn taught at the Landwirtschaftliche Hochschule in Berlin and at the University of Berlin. Through the use of anthropological materials he discredited the theory of economic history then current, according to which man was first a hunter, then a shepherd and finally an agriculturist. He presented the evidence of early economic division of labor between men and women, proving that in the hunting stage while men hunted women collected fruits and small animals. He concluded that women in the neolithic age utilized their discovery that plants arose from seeds, pits and bulbs to insure a regular food supply. Hahn mistakenly classed this form of agriculture, performed with the digging stick, with the hoe farming engaged in by man and called it hoe culture. Because women obtained, prepared and conserved plant food, Hahn ascribed to them the origin of economic activity; he held man responsible for the establishment of the foundation of political, juridic and state affairs, for religious activity and for the major share of magic rites for increasing fertility.

Hahn distinguished between hoe culture, in which domesticated animals are not associated with land cultivation, and plow culture, in which oxen are used as draft animals. He believed that cattle were originally domesticated and milked for religious purposes and that their domestication came earlier than that of sheep and goats. He pointed out that plow culture, which he believed arose in Babylon, is always performed by man, while woman remains the caretaker of the garden. With Eugen Fischer, Hahn considered that man's biological type was determined by domestication, which influences him in much the same manner as it influences animals.

HALE, SIR MATTHEW (1609-76), English judge. Hale acquired a great reputation soon after his admission to the bar, especially in matters of public law, and appeared for the defense in several state trials under Charles I. Although he was a moderate royalist, under the Commonwealth he felt it his duty to serve the existing government and sat as justice of the Common Pleas; at the Restoration he became chief baron of the Exchequer and in 1671 chief justice of the King's Bench, enjoying royal favor in spite of his Puritanism and his strong pleas for religious toleration.

Deeply learned in English law and history and in Roman law, equally at home in common law and in equity (his influence has been traced in Lord Nottingham) and remarkably impartial on the constitutional questions of his day, Hale was "the first of our great modern common lawyers." His *History of the Common Law* (London 1713; 6th ed., 8 vols., 1820) was the first attempt at such a work; *The Jurisdiction of the Lords' House* (London 1796) is a remarkably judicious treatment of a controversial subject and is still valuable; the second part of one of his essays, *De portibus maris* (in *A Collection of Tracts Relative to the Law of England*, ed. by F. Hargrave, London 1787, p. 1-248), described certain wharves as "affected with a public interest," a conception widely used by the courts during the last half century; and his *Historia placitorum coronae* (2 vols., London 1736; new ed. 1800), dealing with the criminal law particularly of treasons and felonies, enjoys very high authority. Among more abstract studies are his *Analysis of the Civil Part of the Law* (first printed with the *History of the Common Law*; 2nd ed. 1716), which was praised by Blackstone, who adopted its arrangement in writing his *Commentaries*, and a criticism from the historical standpoint of

Hobbes' attack on the common law (printed in Holdsworth, W. S., *History of English Law*, vol. v, p. 500-13). A number of his works were never published; a list of them will be found in the *Dictionary of National Biography*. To all these attributes of jurist and historian must be added a character of singular sincerity and piety, which entitled him to be regarded as something like a Protestant counterpart of Sir Thomas More.

THEODORE F. T. PLUCKNETT

Consult: Holdsworth, W. S., *History of English Law*, 9 vols. (London 1922-26) vol. v, p. 482-85, 500-13, and vol. vi, p. 574-95, for a full discussion of his life and works. See also McAllister, B. P., "Lord Hale and Business Affected with a Public Interest" in *Harvard Law Review*, vol. xliii (1929-30) 759-91; Hamilton, W. H., "Affection with Public Interest" in *Yale Law Journal*, vol. xxxix (1929-30) 1089-1112.

HALES, JOHN (died 1571), English reformer and economist. He was the spearhead of Somerset's ill fated attempt to check enclosure of commons and arable lands for sheep grazing and the author of *A Discourse of the Common Weal of this Realm of England* (published anonymously London 1581; ed. from MS. by E. Lamond, Cambridge, Eng. 1893). He held an Exchequer post under Henry VIII and Edward VI, sat in Parliament at least twice, bought monastic lands in or near Coventry and there founded what was probably the first free school in England. In 1548 increasing agrarian discontent led Somerset to appoint a royal commission to study the extent to which enclosure and the creation of parks had caused the decay of villages and houses, decline in arable area and growth of unemployment and poverty. Only the committee led by Hales worked seriously; it undid much of the work of enclosure and encouraged agrarian resistance. This brought on his head the anger and successful opposition of the landed gentry and the earl of Warwick, who accused him of fomenting strife and another peasants' war. To assist the poor and the unemployed Hales introduced three bills in Parliament, calling for the rebuilding of decayed houses, the maintenance of tillage, the encouragement of cattle grazing in order to increase the supply of beef and dairy produce and the checking of food speculation. All three bills were smothered, and when Warwick overthrew Somerset in 1549 Hales had to flee abroad. In exile he wrote his *Discourse*, revealing in dialogue form the contemporary conditions and ideas of England; but it was not published until ten years after his death and then under the initials of some other man. Hales did not oppose enclosure

when it led to better arable methods or was done with the consent of the farming population, as there was an enclosure movement among tenants for farming purposes, not sheep raising; but he had no mercy for "the gredynes of Grasyers and Shepemaisters," for they "destroie Townes, they pull downe houses, they enclose poore men's commens and take away all ther lyvynges." Hales was an economist considerably ahead of his time; in addition to vigorous attacks on the debasement of the currency he opposed exclusive corporations and trade restrictions and justified competition.

HALIFAX, FIRST MARQUIS OF, GEORGE SAVILE (1633-95), British statesman and political theorist. During the reign of Charles II Halifax played an involved but not essentially inconsistent role, assisting in the overthrow of Clarendon, supporting the Cabal but welcoming the Test Act. When Danby came to power Halifax joined Shaftesbury in the opposition and in 1679 gained office for the first time. Although he disliked Catholicism wholeheartedly he was ready for the sake of peace to dedicate his brilliant oratory to the frustration of Shaftesbury's project for excluding the duke of York from the succession. He refused to take active part in the Revolution of 1688 and yet contrived to get on well enough with William III. After a short period as William's minister he retired to write a series of books, detached, witty and full of political wisdom. The most famous of them was his *Miscellaneous Thoughts and Reflections*, a series of aphorisms, many of which have become famous.

In an age when political discussion usually centered around such concepts as natural rights and the divinity of kings Halifax's political writings denounced all general principles and calmly defended changes of party allegiance on the plea of public expediency. Devoting his valued services to various governments, he was loyal only to a policy of moderation. Good partisans regarded him as a dishonest and corrupt "trimmer"—a nickname which he accepted as a compliment. In his *The Character of a Trimmer* (1684 or 1685) he not only defended his own career but elevated the traditional British love of compromise and moderation to the dignity of a political theory.

He eulogized the British constitution because it permitted Great Britain more liberty than any other monarchy, while it avoided the unrest which seemed to him inseparable from more popular governments. Anticipating Montesquieu, he argued that pure democracy demanded an impossibly high standard of wisdom and virtue in the common people. "Our Trimmer," as he described himself throughout his famous apology, was a friend both to Parliament and to the king. His defense of English monarchy although not substantially different from Locke's was predominantly aristocratic and skeptical in spirit. Whereas Locke supplied revolutionaries with a Bible, Halifax's type of moderation was only grist to the conservative mill. Above all Halifax hated the party system, which seemed to him to intensify differences and to crystallize extremes. He was a national government man. "The best Party," he wrote, "is but a kind of a Conspiracy against the rest of the nation." "Ignorance maketh most Men go into a Party, and Shame keepeth them from getting out of it."

Although he was reputed to hold atheistic opinions Halifax defended religion as useful both to the individual and to the state. He was careful, however, to draw a distinction between Catholicism and other religions, arguing in company with Locke that a religion which repudiated the keeping of faith with heretics could not expect to be tolerated by the heretics themselves. When James II came to the throne Halifax opposed the Declaration of Indulgence, warning Protestants in his *A Letter to a Dissenter* (1687) and in his *The Anatomy of an Equivalent* (c. 1688) of the danger of permitting toleration for Catholics as the price of toleration for dissenters.

HALL, CHARLES (c. 1745-c. 1825), English social reformer. Hall was a practising physician at Tavistock, and in 1805 he published his only book on social questions, *Effects of Civilization on the People in European States* (2nd ed. London 1813). He belonged to the natural law school of social philosophers who assumed that

there once existed a natural society whose members, occupied with agriculture and a few auxiliary handicrafts, regulated intercourse and exchange by equitable laws based on the principle that labor formed the only source and measure of possession. Inequality arose when greed induced the few to enclose public lands and deprive the many of their possessions; it grew by its own momentum. Nature gave way to civilized society, which, while it stimulated human activities, progressively enlarged the gulf between possessors and non-possessors, since wealth or capital gave its owners absolute power over the labor of the poor. Production became the function of the non-possessors, distribution and government the function of the possessors. The wealthy were not only keeping the poor in abject poverty but thrusting the smaller independent manufacturers into the ranks of the poor, and civilized society was being progressively divided into two classes whose interests were in direct conflict. Moreover, the extension of the dominion of the wealthy over foreign territories gave rise to international rivalries and wars. These effects of civilization or of manufacture, science, trade and commerce could not be removed unless the cause, unequal division of landed possessions, was removed. The cure of all those ills depended on the return to the equality of the pre-manufacturing era.

Hall viewed the capitalist not as an enterprising organizer but as a lender of capital to producers at usurious interest which left the latter just enough of the produce of their labor to enable them to go on producing wealth. While this view might have originated in the premanufacturing era when merchants were getting hold of the domestic industries through advances of capital, Hall's stress on the rise and development of class antagonism through the industrial revolution was new. Adam Smith viewed the opposition of interests between employer and employee as an ordinary commercial bargaining opposition between the buyer and seller of a commodity, in this case labor power. But with Hall it is an irreconcilable conflict between two classes, one thriving on inequality, the other aspiring to equality.

(London 1919-20) vol. i, p. 126-32, 197, vol. ii, p. 373; Menger, Anton, *Das Recht auf den vollen Arbeitsertrag in geschichtlicher Darstellung* (2nd ed. Stuttgart 1891), tr. by M. E. Tanner (London 1899) p. 47-50.

HALL, GRANVILLE STANLEY (1846-1924), American psychologist and educator. After studying at Williams College, Union Theological Seminary and in Germany, Hall taught at Antioch College, at Harvard University and at Johns Hopkins University before serving as president of Clark University from 1888 to 1920. He ranks with James and Ladd among the pioneers of psychology in America. Like them he had at first a deep interest in philosophy, but unlike them he devoted his mature years exclusively to psychology. Although in 1882 he founded the first laboratory of experimental psychology in the United States at Johns Hopkins University, after 1888 he never returned to experimental work and often manifested impatience with its caution and meticulous accuracy. He attached little value to quantitative methods but often expressed appreciation of intuitive insight. He retained a youthful zest for new trails, was a voracious reader and was gifted with imagination and an amazingly rich vocabulary. His work is thus marked by great volume and wide range, high suggestibility and literary charm, but it lacks exactness of definition, logical consistency and system.

Hall championed the genetic viewpoint; biological rather than physical principles were at the basis of his psychology. With his "psychonomic law," which was the recapitulation doctrine of von Baer and Haeckel applied to mental evolution, was associated acceptance of the doctrine of inheritance of acquired characters. He held not only that humans are influenced in their deeper, more temperamental dispositions by the life habits and codes of conduct of unnumbered hosts of ancestors but that the normal individual in his personal evolution recapitulates the cultural epochs of racial history. These somewhat mystical and now discredited doctrines greatly influenced his educational theories. Precocity was viewed as abnormal and portentous; criminality as atavistic reversion. He found in the "instinct-feelings" not only the more significant elements of the psyche but guides to right living superior to feeble rationality. He deeply influenced educational thought and practise from kindergarten to university. While he made contributions to every phase of psychology, especially those of childhood, adolescence, senescence, religion, sex, race, education, play, morale, war and the emotions, his fame rests equally, if not more, on his truly prodigious influence as teacher, lecturer, pioneer and stimulator of research in both psychology and education, organ-

izer and publisher. As a teacher he was extraordinarily stimulating; as an administrator he cultivated the individuality and independence of instructors and departments and preserved the freedom of faculty appointments from trustee interference. He led in the formation of the American Psychological Association in 1892. His wide interests and propagandist fervor led him to establish the *American Journal of Psychology*, *Pedagogical Seminary*, *Journal of Religious Psychology*, *Journal of Race Development* and the *Journal of Applied Psychology*.

HALL, WILLIAM EDWARD (1835-1894), English jurist. Hall was educated at Oxford and was called to the bar in 1861. He spent little time, however, in the practise of the law, preferring to devote himself to various outside interests, including the study of the military and social sciences. Occasionally he was entrusted with commissions by various government departments. He was an active member of the Institut de Droit International.

Hall achieved fame as a writer on international law. His first work was a monograph on *The Rights and Duties of Neutrals* (London 1874). In 1880 he published his masterpiece, *A Treatise on International Law* (Oxford 1880; 8th ed. by A. Pearce Higgins, 1924). This book was obviously the work of a keen student of history and of the social sciences, who had read much in many languages, traveled widely and mingled with men of different nations; it was at once recognized as an authoritative exposition of the subject. Adopting the standpoint of a positivist, Hall held that existing rules of international law are the sole standard of conduct in that field and that any betterment or change can be effected

only by growth in harmony with changes in the sentiments and external authority of the body of states. Furthermore, he held that international law is based ultimately upon the assumption that states have certain rights and that they are subject to duties which correspond to the facts of their postulated nature. Not the least valuable feature of Hall's work is his method of penetrating below the surface of the positive rules of the law of nations and examining and criticizing the principles on which they profess to be based. A systematic and precise treatise, it reflects the English standpoint, especially with regard to naval warfare; but it is nevertheless fair to the views of others.

In 1894 there appeared *A Treatise on the Foreign Powers and Jurisdiction of the British Crown* (Oxford). This extremely difficult subject had never previously been treated as a whole, and Hall's presentation of it is masterly. The book is also an exposition of some very difficult questions of the law of nations and of English constitutional law.

HALLAM, HENRY (1777-1859), English historian. Hallam's family circumstances, education and legal experience inclined him toward conservative historical views, but this conservatism was modified by a love of liberty and an unrelenting sense of justice. His three histories, monumental in their themes, are: *A View of the State of Europe during the Middle Ages* (2 vols., London 1818; 11th ed., including a supplementary volume of notes added in 1848, 3 vols., 1855); *The Constitutional History of England from the Accession of Henry VII to the Death of George II* (2 vols., London 1827; 8th ed., 3 vols., 1855), his best work; and *The Introduction to the Literature of Europe in the Fifteenth, Sixteenth, and Seventeenth Centuries* (4 vols., London 1837-39; 5th ed. 1855). Primarily interested in the development of law, jurisprudence and political institutions, Hallam subordinated the role of the individual in history to that of the group and endeavored to substitute the natural association of related facts for the usual chronological narrative. On the technical side he set an example by the prodigious scope of his researches and his scrupulous fidelity to sources. Hallam was not dogmatic and disliked systems and theories untested by experience. His faith in a ruling Providence directing the course of

history with a purpose ultimately benevolent did not preclude a conviction of the inevitable decay of all human institutions. He admired the English constitution, believing that it best reconciled and insured order, liberty and wealth, which were the true ends of government. The two houses of Parliament should be equal in power, with competence still residing in the crown to mediate, harmonize and, under safeguards, modify their action. Although a Whig, Hallam could not accept the idea of representation implied in the Reform Bill of 1832. He foresaw dangers to English liberty in the increasing tyranny of party, the rising tide of democracy, the mass and complications of the law and the inquisitions and coercions of executive government.

HALLER, KARL LUDWIG VON (1768-1854), Swiss-German jurist and political theorist. Haller was the typical German literary representative of the social and political currents of the Restoration era. With his *Restauration der Staatswissenschaften* (6 vols., Winterthur 1816-34) he supplied an ideology to the conservatives in their struggle against the liberal tendencies of the time. The brilliant literary subjectivism of the romanticists was recast by him into a firm system of doctrine which laid claim to be both positive and objective as well as soberly realistic. It was this fact which commended Haller's static, prosaic and rigid system, rather than the dynamic and more imaginative flights of Adam Müller, to the interests of the feudal class. For this class sought to restore the pre-absolutist, patrimonial state in place of the modern sovereign state, which refused to tolerate the existence of any independent and privileged classes, and in place of the national state of the revolutionary and liberal bourgeoisie. Haller affirmed the existence of a "natural" relationship between ruler and ruled which was Christian in the mediaeval sense and based not only on might but on an association that was immediate, personal and patriarchal in character. To the state, which was becoming increasingly bourgeois, he opposed the idea of a society, hierarchically constituted and aristocratically dominated. Haller rejected the expansionist aspirations of both the absolutist and the national state. All he desired was the preservation or at most the restoration of power to the aristocratic and noble class with-

in society. In Catholicism with its idea of authority and with its institution of the church, whose political policy, at least in respect to the limitation of the power of the omnipotent state, was in accord with the interests of the aristocratic class, he saw the religious counterpart of his political philosophy. Haller's conversion to Catholicism as a dictate of his political conscience is thus typical of the intellectual world of the Restoration era, in which patriarchal and ecclesiastical tendencies were characteristically intermingled.

Although Haller's influence on political thought was very strong in the period following the Congress of Vienna, it was not of long duration. His political and journalistic activities under Charles x of France came to an end with the outbreak of the February revolution. In Austria his works were prohibited because of their anti-absolutist and Frondist tendencies. And in Prussia, as a result of the revival of great power aspirations and the recrudescence of the traditional state Protestantism, political thought tended more in the direction of favoring wider expansion of the powers of the state. Even such people as the brothers Gerlach and Stahl in the circle of Frederick William IV gradually turned away from the essentially pacific conservatism of Haller.

The following is a list of the names of the persons who have been
 appointed to the various positions of the Board of Directors of the
 City of New York, for the year 1900, as provided for by the
 Charter of the City of New York, Chapter 190, of the Laws of
 1897, as amended. The names of the persons who have been
 appointed to the various positions of the Board of Directors of the
 City of New York, for the year 1900, as provided for by the
 Charter of the City of New York, Chapter 190, of the Laws of
 1897, as amended, are as follows:

There were 4 patients receiving treatment, including one 2-yr-old boy, who was in a comatose state, with a single seizure episode and a normal EEG. The other three patients had been hospitalized for 2-3 months after the febrile seizure attack. In addition to the 10 patients, 10 healthy children of the same age were included in the study group. The diagnosis of convulsions was based on the clinical picture and the EEG. The EEG was performed 1-2 days after the seizure attack. The EEG was performed in the 10 patients, 10 healthy children, and 10 patients with febrile convulsions. The EEG was performed in the 10 patients with febrile convulsions. The EEG was performed in the 10 patients with febrile convulsions.

authority home to every citizen. He also laid down a plan for a national bank, for which his arguments were so irresistible that the necessary bill passed at once. Near the close of 1791 he perfected his system by transmitting to Congress his famous report on manufactures. This expounded the doctrine of a well balanced national economy and a diversification of industry in the interests of independence and security; and running counter to Adam Smith it proposed the systematic fostering of manufactures by protective tariffs, with bounties to agriculture where necessary. The document, which later inspired some of Friedrich List's writings, has served to bulwark more extreme protectionist ideas than Hamilton would ever have countenanced. In 1793 Hamilton decisively defeated the political opponents who questioned his administration of the finances and in 1794 helped vindicate the authority of the federal government in the suppression of the Whisky Rebellion. His great work was then practically accomplished. He had established the national credit, given the nation an efficient financial system, stimulated general prosperity and done more than any other man except Washington to strengthen the union, while he bequeathed a set of ideas—including the doctrine of implied powers in the constitution, embodied in his argument on the national bank bill—which possess continuing vitality.

HAMILTON, GEORGE GORDON, FOURTH EARL OF ABERDEEN (1784-1860), British statesman. Aberdeen was educated under the eye of his guardian, the younger Pitt, was early schooled to austerity by a succession of private sorrows and was deeply impressed by the miseries of

war as ambassador to Austria in 1813-14. As foreign secretary from 1828 to 1830 under the Duke of Wellington, "Athenian Aberdeen" in spite of his enthusiasm for classical antiquity acquiesced in his chief's grudging policy toward the newly independent Greek nation; but again at the Foreign Office from 1841 to 1846 under Peel his sympathy with the moderate Guizot did much to restore friendly relations with France and his spirit of compromise helped to secure the settlement of disputes with the United States about Maine in 1842 and Oregon in 1846. Aberdeen was like Peel a consistent opponent of Palmerston's "intermeddling" foreign policy and desired to keep on good terms with Russia, yet he was destined nevertheless first to be prime minister (December, 1852, to January, 1855) in a composite cabinet which drifted into war with Russia on the side of France and Turkey and then to give place to Palmerston, the leader of the war party among his colleagues. He died almost haunted by this climax to a career which aimed only at peace and moderation. Aberdeen had many private and public virtues but lacked ambition and decision in action. As a minister of parliamentary England in an age of aggressive nationalism his misfortune was to be a man with little sense of party and without national prejudice. A Conservative of liberal sympathies, he followed Peel in a period of transition and pointed the way to a more forcible politician than himself—W. E. Gladstone.

C. W. CRAWLEY

Consult: Stanmore, A. H. G., *The Earl of Aberdeen* (3rd ed. London 1906); Balfour, F., *The Life of George, Fourth Earl of Aberdeen*, 2 vols. (London 1922); Cecil, Algernon, *British Foreign Secretaries 1807-1916* (London 1927) ch. iii.

HAMILTON, ROBERT (1743-1829), Scottish economist and mathematician. Hamilton was at first a partner in a paper mill but resigned in 1769 and shortly thereafter accepted the rectorship of the academy at Perth. In 1779 he went to Marischal College, Aberdeen, where he taught natural philosophy for one year and mathematics thereafter, although he did not become titular professor until 1817. While at Perth he published his *Introduction to Merchandise* (2 vols., Edinburgh 1777-79; 5th ed. 1802) and in 1790 *An Essay on Peace and War* (reprinted in *Essays*, Aberdeen 1831). In 1813 he issued the *Inquiry concerning the Rise and Progress, the Redemption and Present State, and the Management of the National Debt of Great Britain* (Edinburgh; 3rd

ed. 1818). It is usually stated that he was the first to show the fallacy underlying the sinking fund idea. This is, however, a mistake. For his fundamental principle that "the excess of revenue above expenditure is the only real sinking fund by which public debt can be discharged" was expressed in almost identical language well nigh two decades earlier by Albert Gallatin in his published criticism of the American sinking fund which had been initiated by Alexander Hamilton in imitation of Pitt. As Gallatin was not known in England, it was primarily through Hamilton's clear exposition, reenforced by Ricardo, that the British sinking fund was soon abandoned.

Hamilton's other contributions to economics were a pamphlet on pauperism (*An Address . . . on the Management of the Poor*, Aberdeen 1822), called forth by the state of the poor in Aberdeen, and *The Progress of Society* (London 1830), which appeared posthumously with an introductory sketch of his career. This comprehensive work, dealing chiefly in broad generalizations and animated by the prevalent distrust of government interference, is interesting as containing one of the early attempts to estimate the amount and the distribution of the national income.

EDWIN R. A. SELIGMAN

HAMMER-PURGSTALL, JOSEPH VON (1774-1856), Austrian historian and orientalist. Hammer-Purgstall studied at the Oriental Academy of Vienna and passed a number of years in the diplomatic service. Education, residence and travel in the Near East from 1799 to 1807 gave him an intense, lifelong interest in Turkish, Persian and Arabic history and literature. He was a member of many learned societies and president of the Akademie der Wissenschaften in Vienna from 1847 to 1849. He edited *Fundgruben des Orients* and contributed to a number of periodicals.

Hammer-Purgstall was among the foremost European students of the Orient and the author of more than a hundred volumes. His masterpiece, the *Geschichte des osmanischen Reiches* (10 vols., Pest 1827-35; 2nd ed., 4 vols., 1834-36), was a history of the Ottoman Empire from its beginnings until 1774; it was the first work since the writings of Leunclavius in the sixteenth century which was based mainly upon Turkish sources, and consequently it became the standard authority for most subsequent western historians of Turkey. *Des osmanischen Reichs Staats-*

verfassung und Staatsverwaltung (2 vols., Vienna 1815), while incomplete and uncritical, is nevertheless a valuable study of the constitution and administration of the Turkish state. Hammer-Purgstall was also the author of histories of the Assassins, of the Mongols in Persia and the Kipchaks and of the khans of the Crimea. He published travel books, histories of Turkish poetry and of Persian and Arabic literature and a number of translations. His work in all fields was more extensive than profound; he remained a translator rather than an interpreter and judge, often transmitting the contradictions and errors of his sources. Despite obvious and glaring defects, however, his contribution to western knowledge of the Moslem peoples of the Near East is perhaps greater than that of any other scholar.

HAMMURABI, CODE OF. *See* LAW, section on CUNEIFORM LAW; LAWGIVERS; CODIFICATION.

HAMPDEN, JOHN (1594-1643), English parliamentarian. Hampden was a borough member in the third Parliament of James I and in the first three parliaments of Charles I, where his ability, his moderation and his greatly respected integrity soon made him one of the most influential members of the antiprereogative party. Although, like his friend Sir John Eliot, a convinced monarchist to the end he maintained in both the Short and the Long Parliament, in which he sat as member from Buckinghamshire, an uncompromising attitude on ecclesiastical and political matters. Distrusting the king and supporting all measures to limit the royal prerogative he advocated the Grand Remonstrance and was one of the five members whom Charles I vainly tried to arrest in the House of Commons in January, 1642. His earliest opposition to the court was against forced loans, but his name is associated chiefly with the great ship money trial of 1637 and 1638 arising out of his refusal to pay an assessment made on his Buckinghamshire lands under the writ extending the levy to the inland counties. The question at issue was whether in time of national danger the king could take such measures and make such levies "as he shall think fit," to avert the danger; "and

whether, in such a case, is not the king sole judge, both of the danger and when and how the same is to be prevented and avoided." In what was probably the most important constitutional decision between 1603 and 1660 the majority of the judges in the Exchequer Chamber ruled in favor of the king. Although there was some legal precedent for the decision, it proved itself a dangerous weapon in the hands of Charles I and was one of the chief causes of the discontent which led in the year before Hampden's death to civil war.

B., "John Hampden" in *Works*, vol. v (London 1866) p. 539-86; Forster, J., *Sir John Eliot*, 2 vols. (London 1864); Gardiner, S. R., *History of England*, 10 vols. (new ed. London 1893-95) vols. viii-ix, and *History of the Great Civil War*, 4 vols. (new ed. London 1893-97) vol. i; Firth, C. H., in *Dictionary of National Biography*, vol. xxiv (London 1890) p. 254-62.

HAN FEI-TZŪ (died 233 B.C.), Chinese politician and philosopher. A member of the princely house of the small state of Han, he is said to have studied under Hsün-tzū; he belonged to the School of Law. On a mission to Shih-huang-ti, emperor of Ch'in, he made such an impression that the latter supposedly fearing his abilities had him thrown into prison, where he committed suicide by eating poison sent him by Li Ssū, a former fellow student and minister at the court of Ch'in.

Although the background of Han Fei-tzū's ideas was Taoistic, he was far from being a mystic. He was an eclectic who tried to reconcile the activist ideas of Hsün-tzū and the passivist ideas of Lao-tzū. His chief interest, good government by means of law, was the materialization of *tao*, the achievement of those ideal conditions in which non-action, non-interference (*wu-wei*), would be possible. Regarding man as bad by nature, however, he held it vain to rely on some specially gifted or virtuous man; the law should be severe and should work automatically in order to eliminate the human element as far as possible. This law is not based on ethics but is fixed by the prince in an entirely arbitrary and opportunistic manner. It is inexorable and, once published, the prince himself is subject to it. Good citizenship is its aim and it clashes with private standards of morality. "A good citizen cannot be a filial son and a filial son cannot be a good citizen."

The ideas of the School of Law, of which Han Fei-tzū is the best exponent, helped build up Chinese imperial administration, then in its formative stage, and, although the Confucian ideal of "government by virtue" theoretically prevailed, the influence of this school of thought has always been considerable. It became an important intellectual support of the absolute ruler.

Duyvendak with introduction and notes (London 1928); Wu, Kuo-Cheng, *Ancient Chinese Political Theories* (Shanghai 1928); Liang Chi-Chao, *History of Chinese Political Thought during the Early Tsin Period*, tr. from the Chinese by L. T. Chen (New York 1930).

HANCOCK, WILLIAM NEILSON (1820-88), Irish economist, statistician and social reformer. A barrister by profession, Hancock occupied the Whately chair of political economy in Trinity College, Dublin, from 1846 to 1851 and the chair of political economy and jurisprudence in Queen's College, Belfast, from 1849 to 1851. Combined with his pronounced theoretical talents was a reforming temperament which made him primarily interested in the application of economics as well as of statistics to the improvement of Irish economic and social conditions. In 1847 he played the leading part in the establishment of the Dublin Statistical Society, which became amalgamated with the Social Inquiry Society of Ireland in 1855 and under the name of the Statistical and Social Inquiry Society of Ireland has remained active to the present day. The society exercised considerable influence on Irish life and no member contributed more frequently to its transactions than Hancock, who was its honorary secretary from 1847 until 1881 and its president in 1881-82. In 1851 he also founded the Belfast Social Inquiry Society.

Hancock was a strong believer in *laissez faire* and never ceased to advocate the removal of all impediments to freedom of contract. The burden of responsibility for agricultural distress, which he early came to regard as the pivot of the Irish economic problem, he laid upon the land laws restraining free exchange and discouraging the application of capital to land. Among the essays and pamphlets in which he developed these ideas are *The Tenant-Right of Ulster Considered Economically* (Dublin 1845), *On Laissez-faire and the Economic Resources of Ireland* (Dublin 1848) and *Impediments to the Prosperity of Ireland* (London 1850). He also gave much

attention to the question of poor law reform, upholding the principle that family solidarity—society's most effective device for moral education—demanded the substitution of outdoor relief or boarding out systems for the workhouse. As solution of the fiscal situation he proposed the introduction of a single tax based on income and on successions treated as income. In politics he was a Unionist.

From 1851 on Hancock was active as secretary to many important commissions dealing with such matters as Irish education, law reform and railways; and at the government's request he prepared several statistical reports, among them those on the "supposed progressive decline of Irish prosperity" (1863), the "history of the landlord and tenant question in Ireland" (1866) and the "state of Ireland" (1874), as well as a number on Irish banking. He was coeditor of the first two volumes of the *brehon laws* (*Ancient Laws of Ireland*, 6 vols., Dublin 1865-1901).

HAND-TO-MOUTH BUYING. *See* MARKET-ING; RETAIL TRADE.

HANDICRAFT is both a method of industrial production and a form of artistic activity. Each of these aspects supplements the other, but each produces its own particular problems in an analysis of the handicrafts past or present. In early civilizations there was little distinction between "fine art" and handicraft. The sculptural and architectural remains of ancient Greece represent the work of artisans. Much later the magnificent Chinese sculptures from the Wei, Sui and T'ang periods (386-907 A.D.) are anonymous and the work of craftsmen. Mediaeval stained glass windows are generally anonymous as to the individual workmen, although the guilds responsible are more frequently identifiable. In more recent times the "fine arts" have become more clearly differentiated from the "useful arts," but the latter in the hands of a good craftsman are still works of art. It is true that the old handicraft system also produced countless very ordinary products inferior to our own in utility, finish and even beauty of line and requiring many times as much labor. But in general the very process of handwork is condu-

cive to the individual creativeness which produces a work of art.

Before the introduction of machinery every article of use was of necessity produced by hand. Among primitive peoples the handicrafts which we think of as typical—those connected especially with clothing, food and housing—developed very largely from women's work, although the men usually made the tools connected with their own activities, such as hunting, fishing and pilfering expeditions. Magic and religion had an important part in primitive handicrafts and in many activities the craftsman performed his work according to elaborate rituals and followed rules and usages which were believed to be divinely inspired. This is true also among many highly developed cultures, as, for example, those of ancient India, China and Japan. In the historical cultures, as social organization became more complex, specialization increased. If a craftsman did his job particularly well his aptitude was recognized and rewarded and perhaps he even acquired a patron who kept him in fairly continuous employment. In a gradually extending world the craftsman became the keystone of a developing commerce. He organized guilds which afforded him protection and security. He educated his sons in his trade, for there is a strong tradition of continuity by inheritance in the history of craftsmanship. Particular techniques passed down in families for generations, and even apprenticeship was a quasi-paternal relationship. Thus the craftsman increased gradually in individuality, security, scope and importance until the invention of machinery revolutionized industrial production.

Handicraft has by no means disappeared with the introduction of machinery but it has become considerably extended in meaning by the conditions of a machine age. A worker who produces an article by handwork is still a craftsman, even though his labor is facilitated by an electric motor, by machine spun yarns or by standard dyes made in big chemical plants. The technique of handicraft changes with the invention of new tools; its prevalence decreases as industry becomes mechanized; the status of the craftsman changes as he becomes part of a larger industrial polity. Despite these apparently inimical developments, however, handicraft remains an essential method of production in many lines of manufacture, not only because it is for some products artistically superior to machinery but also because it is in many cases essential for well made goods. Modern mechanization although of

fundamental significance is not the first economic change that the handicrafts have encountered.

Analysis of the various "stages" of handicraft economy is not invalidated by the fact that work representing all the stages went on at once, perhaps even in the same place, and does even at the present time, with the modifications engendered by modern technique and industrial organization. Such an analysis is intended only to indicate the various adaptations of handicraft economy to the gradual elaboration in the division of social labor and perhaps to suggest the general historical order of their appearance. N. S. B. Gras (*Industrial Evolution*) in an analysis made according to economic organization uses the suggestive term "usufacture" to describe that kind of manufacture whereby the article is made directly for the consumer from his own raw materials either by himself, his family or a craftsman working for wages. In Gras' analysis the next stage is the "retail handicraft." The retail handicraftsman is a familiar figure in our ancient and mediaeval histories, where we generally find him belonging to a *collegium* or guild. He may either make goods to order from his own raw materials or sell at retail things made up in advance. Often the same craftsman does both. He sells for a profit instead of working for wages. When he also makes things for the use of his family he represents two of the phases or stages at once; and some writers split the retail handicrafts into two stages, putting the sale of made up merchandise from the shop into a later phase than the custom order. The same craftsman may be in still another of the stages—the "independent wholesale handicraft"—if he also makes articles for a merchant to export. Generally, however, in mediaeval European cities there was a fairly sharp separation of the craftsmen working directly for the local retail trade from those who made goods for more remote customers reached through wholesalers. The problems of regulation and the types of guild needed to meet them were different in the two cases. Gras' next phase—the "dependent wholesale handicraft"—represents a still more elaborate commercial development. In towns which had a very considerable export trade a few commercial middlemen practically dictated the kind and grade of product made up for them and might even control the processes of manufacture if interest so dictated, which it evidently did not as a rule.

An organization of dependent craftsmen working for the wholesale trade was more like a modern labor union than was a guild of independent

retail handicraftsmen. The practically closed handicraft economies of the towns were an obstacle to the growth of effective territorial specialization. Conversely, the potential economies of such specialization, sought by the organized merchant groups which monopolized the trade between towns and regions, tended to undermine the stereotyped local crafts by increasing wholesale exchanges. In this situation states grew up capable of affording protection and regulating tolls. Town autonomy being in the way of economy and of powerful interests was worn down. The state had no regulative machinery, such as the old combination of town governments with craft guilds, for intimate supervision of processes and materials. Having likewise no interest in local monopolies the central governments concentrated their attention on such simplified and territorially generalized regulations as stood some chance of enforcement from above. Thus the wholesale craftsman became part of a larger and more complex polity, but he lost his individual bargaining power and the intimate protection he had enjoyed during his independence.

The last of the so-called handicraft stages—the central workshop—represents centralized manufacture under supervision. In some trades and localities the distribution of work to successive craftsmen working at home failed to achieve a reliable production schedule or to avoid the theft and substitution of materials, and the central workshop arose to meet such difficulties of control in the putting out system, as the dependent wholesale handicraft organization is often called. These assemblages of craftsmen, especially of textile workers, on the same premises resembled the factories of the industrial revolution mainly in respect to discipline. Even here the handicraftsman was not of course paced by power machinery. As in unmechanized oriental workshops today, he could take his time; and an interruption to see the passing procession or even to celebrate a whole feast day did not leave much capital eating itself up at interest.

Although products of the highest order of utility and artistic merit continued to be made after the expansion of trade in the Middle Ages, the growing separation of producer from consumer increased the difficulty of preventing the appearance of cheaper grades. Formerly the workman had his place in the guild, which had its place in the town and protected his share of the monopoly along with those of the others. The main business of the craft organization had been to enforce minimum standards—to prevent

actually poor or dishonest workmanship—but with the decline of the guilds and the opening of broader areas of trade this supervision became less effective.

The most critical stage industrially as well as socially in the transition to machine processes was the second half of the nineteenth century. Difficult problems, such as that of power weaving, had been solved, driving craftsmen into machine processes out of the medium grades of craftsmanship, which had served as reservoirs of skill for the better and more original work. Sound and pleasing design was neglected for types of goods cheap to manufacture in large series; and for a time the old handicraft patterns, refined through centuries, were actually eschewed by fashion and threatened with extinction.

The reaction from this extreme took place in several countries almost simultaneously and was led by antiquarians and artists who appreciated the intrinsic merits of the older things. In England people like John Ruskin, William Morris, Walter Crane and Dante Gabriel Rossetti had long inveighed against the unnecessary ugliness of machine made products when the arts and crafts movement took shape in the last quarter of the nineteenth century. This movement spread to America just before 1900. In Sweden Arthur Hazelius led the handicraft revival by collecting fine old specimens and by his activity in promoting the famous Northern Museum at Stockholm, a repository of the cultural history of Scandinavia. The Swedish agricultural societies both national and local immediately became interested in handicraft as a cottage industry. This whole movement, which got well under way with the establishment of the Swedish Handicraft Association in 1899, has based itself on the reproduction of national handmade products of earlier times. All over Sweden there are local associations which exchange ideas and services through a Union of Swedish Handicraft Associations founded in 1912. The local association furnishes the raw materials, patterns and instructions, pays wages to the workers and receives the finished products, which it sells in its own sales-rooms and exhibitions. Much "nature" dye is used in the handicraft woolen textiles, and the yarn is hand spun. Commercially the movement has reached the stage of self-support, but its educational activities receive subsidies from the central government, the counties and the agricultural societies.

Germany's late industrialization preserved her handicrafts, and the struggle for markets already

largely preempted also put off in some branches of industry the mechanization which students of around 1870 took for granted. The organized hand workers kept up their long struggle for suitable government recognition, protection and supervision; and in 1897 an act was passed fixing the status of the *Innungen*, or guild types of handicraft organization. Of these there are free and compulsory associations. Membership in the first is optional for those in the crafts and districts concerned. By majority vote, however, one of these craft groups may establish compulsory membership with an elaborate code recognized and enforced by public law. Aside from the fact that their compulsory character rests upon a vote, these *Zwangsinnungen* are much like mediaeval guilds. Their laws govern apprenticeship, journeymanhood, mastership, processes, quality, marketing propaganda, interrelations and discipline and may also provide for mutual aid and insurance. About three fourths of the independent craftsmen of Germany are bound together in these *Innungen*, the figure having grown from 477,345 in 1907 to 969,676 in 1930. Of the two types the "free," or looser, lost in membership during this period, while the highly regulated grew from 220,178 to 771,622. As farmers and as independent craftsmen the German hand workers have been aided in their competition with factories and with the larger marketing organizations, in which large scale production units tend to excel, by the growth of the co-operative movement. Skilled handicraftsmen make up about a quarter of the membership of the Schulze-Delitzsch cooperative credit societies, especially in the towns. The effects of the Raiffeisen rural credit societies on handicrafts are less direct and more difficult to estimate exactly. In 1926, if members of families be included, nearly eight million people in Germany—12.6 percent of the total population—derived their living from handicraft work. If we add those engaged in handicraft but not directly employed in the handicraft enterprises, the fraction is around one fifth. In 1928–29 the money turnover of the handicraft undertakings was between 14 and 16 percent of that for the entire country.

The organization of craftsmen has proceeded along lines similar to these in practically every country of Europe. In general the primary units are the local societies. In addition to heads of craft enterprises and small industries these organizations include autonomous workers independent of any central workshop and also journeyman assistants and apprentices. The local

societies, which run into the thousands in most countries, are brought together for purposes of administration and unity into a national federation. These federations hold frequent congresses, often with delegates from other countries. In 1930 was held in Rome the first International Congress of Craftsmen, attended by delegates representing twenty craft organizations from fourteen European countries. The craftsmen's federations are largely cooperative in organization, and they are closely connected with the cooperative societies in the interests of credit, production and marketing. The principal activities of the craftsmen's organizations vary in different countries. For the most part they are directed toward improvement in technique and quality by means of education, supervision, competitions and exhibitions, modernization of methods and occasionally by a trademark guaranty; toward financial assistance in the form of credit facilities, craftsmen's banks, certain tax exemptions, sometimes even the offering of bonuses for migration; toward help in the marketing of products, mostly through cooperative marketing societies and through organized exhibitions and salesrooms; and toward effecting an improvement in general working conditions, stimulating production and trade, securing government representation of the interests of craftsmen and in general attaining a unity and organization which will allow the handicrafts the security they deserve.

One of the principal difficulties in securing statistics of the handicrafts is the question of definition. With craftsmanship ranging from the creative work of the artist to the combination of machine with hand work in factories, from highly skilled technique to routine repair work, from solitary labor in a home to the assistance of many others in a shop or factory, it is difficult to determine exactly the extent of contemporary handicrafts. Since craftsmen, however, usually work in small units, the difficulty has been met as well as possible by fixing an arbitrary size unit above which a productive enterprise will be considered large scale industry and not craft work. In most countries this unit is ten workers.

It seems obvious from available statistics that even in highly industrialized countries the retreat of craftsmanship before the machine has practically stopped. In some places and lines the tide has actually set in the other way. Even in Great Britain and the United States, although there are no statistics available, the handicrafts seem at least to be holding their own. In the less industrialized countries, as are most of the

smaller nations of Europe, there is a very high proportion of handicraft. There is a good deal of reason to believe that the countries now becoming industrialized, such as Japan, Russia and to a lesser extent China and India, will not carry mechanization to extremes. In the region of eastern and southeastern Asia, which contains half the world's population, long standing habits of consumption cling to goods which do not in all cases lend themselves to factory production. Factory regimentation is unwelcome, and a dense handicraft population is itself a brake on complete mechanization. In Japan, the most industrialized of oriental countries, the handicrafts are still more important industrially than the factories and there is a vast number of small workshops which produce some of the highest priced and most distinctive of Japanese goods. Even in the factories the large number of hand processes in comparison with English or American establishments is impressive.

In Russia before the World War and the revolution about two thirds of all industrial workers were engaged in the handicrafts; and for many products, such as leather shoes and tailored articles, the consumer's market was supplied almost entirely by the handicrafts. The attitude of the Soviet government toward the crafts is indicated in a decree of May 3, 1927, of the Council of People's Commissars: "For a long time to come large-scale industry will not be able to produce sufficient for the needs of the country, nor will it be able to absorb all the surplus labor. Small-scale handicraft industry will use this surplus labor, especially among the poorer strata of the peasantry, and will to a great extent satisfy the needs of both rural and urban markets. This explains its enormous importance for the national economy of the Union of Soviet Socialist Republics." In the Five-Year Plan the development of handicraft and the promotion of cooperation among craftsmen are given a great deal of emphasis.

The Russian Central Statistical Office includes handicrafts among those undertakings which employ thirty or fewer workers without motive power or fifteen or fewer workers with motive power. In a census for 1929-30 it was revealed that 60 percent of the total number of industrial workers were engaged in small scale industries; in 1928-29 the value of their production was 21.6 percent of that for the total industrial production of the country. Since the more important of these industries are concerned with such products as leather, textiles, wood,

clothing, pottery and small ironware, it is evident that craftsmanship has an important part in them. Moreover about 75 percent of the workers in these industries live in rural districts and in addition to making articles for the market manufacture many things for their own use. This combination of the farmer and the craftsman is extremely important in the national economy of Russia. It supplies a needed supplementary occupation to agriculture, and it is the means of furnishing practically all the manufactured articles, except machinery, which are needed by the countryside. From the point of view of value, however, the most important craft in the Soviet Union is the carpet industry of the Caucasus.

Cooperation in Russia, as elsewhere, is of particular importance to craftsmen and the government is making every effort to increase their membership in cooperative organizations. In 1929-30 about 25 percent of the workers in small scale industry belonged to these societies and membership is constantly increasing. The central organization is the All-Russian Federation of Craftsmen's Cooperative Societies (*Vseko-promsoyuz*) organized in 1922, which supplies the subsidiary cooperative societies (*artels*) with raw materials, semimanufactured goods, machinery and tools and distributes for them their finished products.

Whether the craftsman fares well or ill under modern production methods depends on too many conditions to be settled arbitrarily. The independent craftsman of the present day has certainly a greater freedom of technique because of modern inventions. On the other hand, he faces more difficult competition because of modern standardized production and cheaply made imitations, although this difficulty can be met to a large extent by the facilities of cooperative purchasing, credit and marketing. In many countries craftsmen's organizations give him a large measure of the security and protection he previously received from the guilds, although since he is not technically a wage earner he is still in most countries debarred from many of the advantages of social legislation, such as sickness and old age insurance, which might reasonably be considered his right. The dependent craftsman is confronted with all the problems of modern labor and frequently also with restrictions on his product effected by the pressures of money making and fashion; but even before machinery revolutionized the nature of his work the wholesale craftsman had to a considerable extent lost

his freedom of design and found himself largely at the mercy of the merchant.

On the other hand, it is easier to decide whether the consumer has lost in other values what he has gained materially through the modification of handicraft by the factory. Potentially he stands to benefit. There would be obviously no advantage save cheapness in the substitution of hand for machine work on jobs involving routine repetition or on products which are all the better for a high degree of uniformity or on processes in themselves laborious and unnecessary. And when hand labor is cheaper it is nearly always because of low standards of living, not efficiency. On jobs where standardization means sacrifice of subtlety, on products which deserve careful design, on processes which require individual technique, there is still the possibility of cooperation between the hands of the craftsman and the machinery of the factory. One of the important activities of the *Rationalisierung* movement in Germany is the scientific reduction of lost motion in handwork, coupled with a determination of the rational line of substitution between hand and machine, and an exploration of the field in which the two might combine to get the best results of each.

But this ideal cooperation remains potential. Actually in spite of tremendous improvement in the adaptation of the handicrafts to modern production methods products of the ordinary commercial grades, which very largely fix and reflect public taste and which should have at least the supervision and cooperation of the craftsman, are produced in standard wholesale lots by factories. Questions of design are too often settled by the foremen of larger plants or the owners of smaller ones on the basis of cheapness to produce. It is generally agreed that much of the ugliness of line and color could be improved practically without cost by a long time, rational planning of industry so as to combine in the same persons some trained ability at designing and a technical knowledge of the methods and costs of embodying the designs in finished goods with present day equipment. The consumer who might theoretically refuse to buy slipshod adaptations of current modes, often second or third hand bad imitations of good old patterns, is often careless of other considerations than price, and the range and character of his purchases remove him farther and farther from the technical capacity to judge quality for himself. No successor to the old guild system has so well solved the problem of protecting the consumer from de-

fects in materials and workmanship. French industry is evidently better than most in this respect, but this may be largely a matter of the slow progress of mechanization and of historic concentration on lines of goods in which original design and variety of finish are of more than average importance. Certainly there is no dearth of flimsy, awkward and even ugly products in France, not to mention many which cost more than they need to because of inefficient production technique.

On the whole there is less of the sentimental, "arty" imitation of an older order than there was during the first vehement reaction to the machine in the latter part of the nineteenth century. Of the definite "handicraft movements" the most effective—except perhaps in the way of educational significance—have been those ultimately concerned with broader issues than the mere revival of handicraft for its own sake. The Swedish movement, for example, has been a means of giving profitable occupation to rural sections where large scale industry would be impossible. The high proportion of handicraft enterprise in Germany is a survival of an older type of industry found because of particular conditions to be still effective in the modern world. And the craftsmanship which still survives in certain industries in all countries exists because handwork is still as essential as it ever was in order to make certain products satisfying. If public taste becomes more discriminating as to what it considers satisfactory, handicraft will have an even wider field; but in order to have true significance in the modern world it must respond to a real desire, not a faddish whim, and it must make intelligent use of present day industrial technique.

HÄNEL, ALBERT (1833-1918), German jurist and political figure. As a teacher Hänel lives in the memory of contemporaries by virtue of his work at the University of Kiel in Schleswig-Holstein, where he was professor from 1863 to 1911. He was much attached to this province, his adopted home, and served it upon many occasions both as a political and legal publicist and as legislator. He was largely responsible for the provincial ordinance of 1869. His services were particularly valuable because he was steeped in the history of German law, the field in which he had begun his juristic work. A study of the system of proof of the *Sachsenspiegel* and a collection of the legal sources of the town of Goslar (*Decisiones consulum goslariensium*, Königsberg 1862) are his two most important efforts as a German legal historian.

Hänel's career as a jurist fell in the period of the rise and fall of the German Empire and he did his most important work in the field of public law. With Laband, whose teaching he supplemented while opposing it in many particulars, he became the most representative advocate of the theories of public law of the time. Among the constitutional problems of the new empire the most outstanding was the question of its juristic nature—a question whose answer must always depend upon how the relation of the empire to the states is conceived. Hänel impressively opposed the compact theory, the danger of which had been recently demonstrated by the American Civil War. In this he was in essential agree-

ment with Laband. On the other hand, he never admitted the latter's almost unanimously accepted distinction between law in a formal sense, as a legislative act, and law in a material sense, i.e. law with a normative content. The problem agitated the jurists of the time because the new constitutional organization tended to stress the formal rather than the historical aspects of law-making.

As a political figure Hänel adhered to liberalism, which he espoused for many years as a member both of the Reichstag and the Prussian *Abgeordnetenhaus*. His goal was the reconciliation of liberty with authority, and Baron vom Stein was his ideal of a German politician. Although his views often brought him into conflict with Bismarck, he continued to cling to them. He defended at all times the rights of the Reichstag, which seemed to him to stand for the interests and freedom of the people.

HANNA, MARCUS ALONZO (1837-1904), American business man and politician. Hanna accumulated a fortune in the wholesale grocery trade, in the mining and selling of coal and iron and in banking and railways. His interests turned increasingly to politics, until in 1895 he retired from active business to devote his entire energy to pushing the political fortunes of his intimate friend William McKinley. As chairman of the National Committee of the Republican party Hanna directed the strategy of the party in the campaigns of 1896 and 1900, obtained large monetary contributions from corporations frightened by Bryanism and was more responsible than any other individual for frustrating the uprising of western agrarianism which culminated in the campaign of 1896. He was rewarded by an interim appointment as senator from Ohio and was regularly elected in 1898 and again in 1904. Hanna frankly represented the business man in politics and was never afraid to identify himself

with the cause of corporate aggrandizement. As head of the Republican National Committee and close friend of President McKinley he occupied an influential place in the government but seldom spoke from the floor of the Senate. A notable exception to this was his strenuous advocacy of the Panama canal route as against the Nicaraguan route, a battle in which he finally won over the Senate to his point of view. He waged a consistent but unsuccessful campaign for revival of the American merchant marine by means of ship subsidies. Although opposed to the Spanish-American War and dubious about imperialism Hanna supported both in 1900 for strategic political reasons. Bitterly assailed in the opposition press as the agent of "big business" in politics, caricatured in cartoons as a bloated millionaire covered with dollar signs, he was nevertheless widely esteemed and respected and in his later public life achieved the proportions of real statesmanship. Hanna believed that organized labor was a natural corollary of organized capital, devoted much time during his last years to the conciliation of labor disputes, especially in the great coal strikes of 1900 and 1902, and served as the first chairman of the National Civic Federation's committee of conciliation. A product and a symbol of the new industrial and financial order which bloomed in the late nineties, he was, as far as his attitude toward labor was concerned, ahead of the majority of his contemporaries. Neither an idealist nor a reformer, Hanna took over the methods current in politics at his time and used them effectively.

HANSEATIC LEAGUE. The Hanseatic League, or the league of the cities *van der du-deschen hense*, was an economico-political organization of German commercial towns guaranteeing to its members the enjoyment of trading privileges obtained by the league. This organization was not definitely formed as a league of cities until 1358. Before that time the term *hansa* (Gothic, Old High German and also the Latinized form; Low German, *hense*; Middle High German, *hanse*) designated a company or fellowship

of individuals rather than of cities. It came into general use in northern Europe at a time when mercantile enterprise was conducted by groups of merchants traveling with their wares from market to market and it evolved in connection with their status in the places which they visited. Thus the German merchants engaging in trade in England or Flanders were organized into guilds; and those who made commercial voyages in common formed a hanse of this guild. The first German merchants in England, those from Cologne, were accorded privileges by the English and granted legal status as the Cologne hanse. When merchants from other German cities, particularly Hamburg and Lübeck, penetrated into England they were also treated as hanses of their particular native cities, until toward the end of the thirteenth century a uniform legal status was established in England for all German merchants, who as the *mercatores de hansa alemanie* had common rights and duties and a joint establishment at London called the Guildhall, later the Steelyard. In the following century the English and Norwegians used a collective term, *mercatores de hansa theutonicorum*, not merely for the Germans in England but for all the German merchants trading outside of Germany, whether in England, Flanders, Scandinavia, in the Baltic states or in northwest Russia. Such a development was the more natural, since at this time all these merchants were actually organized into a *universitas communium mercatorum* exclusively for natives of the German, or Holy Roman, Empire. The *universitas* had its headquarters on the island of Gottland in the Baltic and a number of local branches, the most important next to the Guildhall being at Bruges, Bergen and Novgorod. These branches were independent; this was true, for instance, of the Bruges branch until 1356, when it found itself in difficulties with which it was unable to cope. Representatives of the German cities most immediately concerned intervened in its affairs. In this connection there occurs for the first time in 1358 the term *hansa* as the name of the association of towns on the coast and inland from the lower Rhine north to Riga, Reval and Dorpat which were interested in maritime trade in the Baltic and North seas. When in 1366 the enjoyment of the Hanseatic privileges abroad became dependent upon citizenship in one of the towns of the *hansa teutonica*, the league had attained its definitive character and the term *hansa* its final meaning. The privileges obtained by the league throughout its foreign trading area com-

prised freedom and security of traffic for the citizens of Hanseatic towns as well as customs rebates. In England, for instance, Hanseatic merchants were allowed in 1350 certain customs privileges in the export of undyed cloth, and elsewhere their trade was often entirely free of duty. Particularly in cities such as Bergen and Novgorod where they were permitted to establish themselves as individual alien merchants they received the privilege of autonomous jurisdiction within their settlement.

The peculiar position of the Hanseatic League can be explained only in terms of the economic role which the towns of the Hansa had come to play in European life. The emergence of this role in its turn depended upon the conditions prevailing in northern Europe in the twelfth century. During this century Germans of all tribes and callings began to migrate across the Elbe-Saale line, the previous eastern limit of German civilization, and to take up their abode, usually with the consent of the Slav rulers, in the sparsely settled Slav territory beyond, where they cleared the forests and broke the heavy soil which had defied the primitive agricultural implements of the Slavs. At this time there already existed in western Germany, in Westphalia and along the lower Rhine a highly developed town life. The dominant social class in these towns consisted of merchants engaged in foreign trade who had penetrated across Schleswig to the Baltic coast traveling on foreign ships, for the Baltic was still a Scandinavian-Slavic lake, and thence to Novgorod on Lake Ilmen, a famous fur mart sought by Scandinavians, Greeks and even Arabs. When the German colonization in Slav lands began, these commercial pioneers, fully aware of the prizes to be won in the east, plunged into it with vigor. It was they who really founded and built the eastern towns, receiving in their enterprise the protection of the local rulers. Lübeck, the first and most famous settlement, was refounded in 1158 under Henry the Lion, the great Guelph prince. A line of cities sprang up in the twelfth and the early thirteenth century—Visby on Gottland, Riga, Dorpat and Reval on the eastern coast of the Baltic—all pointed toward the magnetic market of Novgorod, while the southern rim at the same time and later became dotted with other German towns, like Wismar, Rostock, Stralsund and Danzig. After a brief peaceful competition with the peasant traders, particularly the natives of Gottland, who had formerly plied that region, the German merchants acquired economic control of the Baltic.

One factor responsible for their speedy success was the nature of their municipal organization, which was modeled on the old German plan and thus directed toward the sole purpose of facilitating foreign trade; another was the fact that the Germans had developed a craft peculiarly adapted to the carrying trade, the *Kogge* with its capacious hold for cargo. Western Germans from Cologne, Soest, Dortmund and Münster joined those from the newly settled eastern towns in exploiting the Baltic trade; and the centrally located island of Gottland became the seat of the all German *universitas*, which preceded the Hanseatic League. The significance of this monopoly was that it enabled the Low German merchants in the thirteenth century to become the first and soon the indispensable commercial link between Flanders and England in the west and the Baltic coast in the east and to wring concessions from the western towns and countries which they served. Flanders in particular, overpopulated and more highly industrialized than any other region of Europe, was so dependent upon the grain and raw materials of the east that rather than jeopardize its supplies its towns and rulers willingly granted extensive privileges to the Easterlings, as the Hanseatic merchants were called in the west. England, then a producer of raw wool for the use of Flemish weavers, also favored them above other merchants.

The transition from the *universitas* of German merchants to a league of Hanseatic cities took place about 1300 under the leadership of Lübeck, which occupied a crucial position in the Hanseatic trade route; at this port the eastern wares left the Baltic to be transported across the narrow isthmus of Holstein to Hamburg and thence to the west. Its leadership among commercial towns was due also to the extraordinary political sagacity and energy manifested by the council of Lübeck in the face of great difficulties. The geographical position of Lübeck devolved upon it the formidable task of protecting Holstein against the southward push of Danish imperialism. By capturing Holstein the Danes would have completely crippled Hanseatic trade, for they controlled The Sound between Scandinavia and Denmark, which was the chief water passage from the Baltic to the North Sea, and had this control further fortified by the possession of Skåne, the southern tip of Sweden. So important for the political destiny of the Hansa were the relations with Denmark that practically its entire foreign policy revolved about that problem. Following its formation of a coalition

which repelled the Danish imperialistic wave on the field of Bornhöved in Holstein in 1227, Lübeck pursued a continuously brilliant policy of alliances, which eventuated in its official recognition as the leader of the Hanseatic cities. Because of this position, combined with its constantly growing economic importance as the center of the east-west trade route, Lübeck was able at the end of the thirteenth century to silence forever the claims of the Gottland *universitas* to hegemony over the German merchants. The development of the definitive Hanseatic League was temporarily impeded at the beginning of the fourteenth century by a fresh Danish invasion, which eclipsed Lübeck's power until after the death of the Danish king Erik Menved. But by the latter half of the century Lübeck had completely recovered, and in the years following 1358 the league was organized not as a political and military alliance but as an economico-political association.

The league rose to the proud apogee of its power and influence almost as soon as the work of organization had been completed, as the result of the brilliant termination of its first great military test in the Danish wars of the 1360's. To meet the aggressiveness of the famous king Valdemar Atterdag a great number of the Hanseatic cities formed a special political alliance known as the Cologne Confederation of 1367, which under the leadership of Brun Warendorp, burgomaster of Lübeck, concluded the second of the wars with the triumphant Treaty of Stralsund. The political victory was signalized by the terms of the treaty providing that Denmark relinquish to the allied cities for a period of fifteen years two thirds of the very important tolls from Skåne to Helsingborg on The Sound, that this indemnity be guaranteed by the cession of strong castles located on The Sound and that the cities be awarded a veto power in the choice of Valdemar's successor. Economically the treaty resulted in the guaranty and extension of the league's trading privileges abroad.

The exact identity of all the towns belonging to the league is difficult to determine because of its nature as a loose and fluid economico-political alliance rather than a political union with fixed territorial boundaries. A town acquired the distinctive characteristic of a Hanseatic city by obtaining for its citizens the right to enjoy commercial privileges abroad; and this right might be at any time granted, withdrawn or renounced. Hence, although it is customary to speak of seventy-seven Hanseatic towns, the

number enjoying Hanseatic privileges at one time or another was much greater. It was, however, a fixed rule that only towns with German population could join the league. From Lübeck, always the undisputed leader, and the so-called Wendish towns grouped about it—Wismar, Rostock, Stralsund, Kiel, Hamburg and Lüneburg—the line of Hanseatic cities extended along the coast through Pomerania and Prussia to the Baltic states. In Prussia Danzig, Thorn, Elbing and Königsberg were the most important; but the activity of the Teutonic Knights, who not only had created a network of commercial towns throughout Prussia but as an order were engaged in mercantile enterprise and were shipowners on a grand scale, had made virtually the entire land dependent upon the Hansa. Riga, Reval, Dorpat and Pernau were the principal towns in the Baltic states with Visby on the Baltic Sea itself. Stockholm and Kalmar, the development of both of which was connected with the foundation of German towns on the Baltic, were, although loosely, affiliated with the league; at least in the fourteenth century Stockholm's commercial interests are scarcely distinguishable from those of the Hansa. In the far west certain towns of the province of Gelderland in what is modern Holland belonged to the league and many towns along the lower Rhine from Wesel to Kampen and Zwolle. The leader of this group was Cologne. In Westphalia besides the important cities of Soest, Münster and Dortmund there were a great number of tiny Hanseatic towns and villages. The league also had many members inland in lower Saxony and Brandenburg, the lower Saxon towns finding their outlet to the sea through Bremen. Others like Cracow and Breslau were located still more remotely inland.

Periodic Hansa diets were held to settle the major problems of the league, but participation in them often entailed heavy cost and was exacted only from the larger towns. The latter served as representatives of the smaller towns in their region. In addition there existed local assemblies, such as the Prussian town diets, to which all the Hanseatic towns in the territory sent representatives. Invitations to the Hansa diets came from Lübeck, whose councillors also presided over the diets and conducted all the correspondence of the league. In the intervals between assemblies Lübeck was the recognized spokesman of the other towns. The league had no permanent periodically recurrent revenues. The cost of embassies was covered by individual cities, while the expense of maintaining offices

and factories in foreign countries was defrayed out of fees paid by Hanseatic merchants who used them. For extraordinary expenditures such as those entailed by war special import and export duties, called poundage, were imposed on ship cargoes. The register of such duties, introduced in 1368–71 to pay for the cost of the Danish war, constitutes at present one of the most valuable sources for the study of mediaeval commercial history.

In Hanseatic history two great stages can be distinguished, the period when it was dominated by the drive to expansion and that of stagnation and decline. The first may be dated from approximately 1150 until the Treaty of Stralsund. During the first century of this early Hanseatic period, while the merchants were still carrying their wares from port to port and sharing the risks of foreign travel with a group, or hanse, of their comrades, their enterprise was motivated by a cooperative spirit. But after about 1250 the compulsion became individualistic and for the next hundred and twenty years there was manifested an unrestrained quest for private gain far surpassing that evidenced at any other period in Hanseatic history. The new stimulus to commercial activity was provided by the changes accompanying the introduction of writing, which enabled the merchant to operate on an efficient basis. Instead of being forced to undertake trading voyages in person the merchant from 1250 onward could and did establish a central office, the *skrivekamere* or *Kontor*, from which he conducted business with all the towns in the sphere of his interests by means of written documents. At the central office he maintained a bookkeeping system; remarkable examples of these early books have been preserved. The employment of assistants, partnership contracts and agreements with commission agencies were introduced and grew constantly more common, widening the potentialities of commercial activity at the same time that they made it more complex.

During this period the citizens of the Hanseatic towns who aspired to wealth, power and prestige had to seek them through the avenue of commercial success; profit from real estate held only secondary attractions. In general whoever failed to exploit the commercial innovations as they presented themselves became submerged beneath the stratum of *homines novi*. Merchants like Bertram Mornewech (d. 1286), whose, for the time, astounding fortune is attested by the fact that his widow was able to purchase in the form of annuities real estate equivalent to about

1,500,000 modern marks, had a dominating position in Lübeck by 1300. They ruthlessly bought out the descendants of the old Lübeck mercantile élite who had prematurely retired to living on their incomes. Since municipal government in the Hanseatic cities was so organized that the members of the governing council were recruited from the wealthy, those who lost their fortunes concomitantly lost their political power. This identity of political and economic responsibility, which placed the towns under the political leadership of its most enterprising citizens, helps to explain the vitality of the Hanseatic League.

As a natural reflection of the hegemony of the successful merchants the councils bent all their energies to the promotion of trade. Toward the end of the thirteenth century they began to pursue an unscrupulously aggressive foreign policy. The Lübeck merchants invaded Norway and opened it to world commerce. Whatever ultimate benefit their activity may have conferred upon Norway, the immediate effect was to force it at the risk of antagonizing the formidable power of the leader of the Hansa to accept the commercial dictatorship of Lübeck and to yield to it unquestioned control of the principal articles of export, dried codfish and butter. Not content with the ingenious system by which it preserved and developed its indispensable position in the exchange of eastern raw materials for the finished products of the west, Lübeck thus set itself to seize also the north-south routes. It acquired a monopoly of the rich northern fisheries, of the herring from Skåne as well as of the cod from Bergen. For a while all of northeastern Europe depended upon the salt which the Lübeck merchants brought from Lüneburg. With their fish they exploited the southern consumers' market as far to the east as Prague and beyond the Alps, taking full advantage also of such routes into the German interior as that through Frankfort to the upper Rhine region, to Erfurt and later even to Nuremberg.

In their domestic policy the councils neglected no means of tightening the bonds by which the merchants held the artisans in subordination to their interests. The achievement of their object involved little difficulty in view of the artisans' dependence upon the commercial class through the latter's ownership of real estate. The homes of the artisans, their workshops and their market stalls were at first owned outright by the families of mercantile entrepreneurs and later with the same result were controlled in part by the councils. Those who manufactured for export—shoe-

makers, coopers, amber workers—were even more immediately subjected to the merchants.

The Treaty of Stralsund marked the beginning of the period of stagnation and decline because by this time the Hansa had already exceeded the limits which it could easily maintain. It is the sign of a high state of political development that Lübeck clearly evaluated the growing forces of resistance against the league and, renouncing a policy of further expansion, concentrated after 1370 entirely upon preserving the position already achieved.

Part of the danger arose from the emergence of commercial competition. In the latter part of the fourteenth century England, which had formerly sent its wool to Flanders to be manufactured, began to make the cloth itself. Unlike the Flemish, the English cloth producers sought their own markets on the Baltic. As a result Bruges, the chief western outpost of the Hanseatic system, lost importance. Simultaneously the "bay salt" obtained along the western coast of France acquired a more extensive market in the Baltic region, impairing the value of the Hanseatic monopoly of Lüneburg salt. These two developments were less ominous in themselves than because they contributed to the increased use of the *Umlandfahrt*; that is, the direct water route from the North Sea to the Baltic around the Jutland peninsula and through The Sound. Of all the league's problems this deflection of traffic from Lübeck constituted the gravest. As the power controlling The Sound Denmark gained inversely as Lübeck suffered. It became the much sought and obliging ally of the league's other rivals, first of the English and then principally of the Dutch, whose Baltic trade grew rapidly from the fifteenth century on. Lübeck was, however, often successful in supervising and confining the voyages of the Dutch, until her valiant efforts to do so and her political power finally collapsed in 1535.

A variety of converging factors after the Treaty of Stralsund resulted also in the progressive disruption of the internal unity of the league. The problem of The Sound, for instance, wore an entirely different aspect for Lübeck and her neighbors on the one hand and for the eastern Hanseatic towns on the other. The latter had much to gain from the increase of the all water trade in the Baltic and could hardly be expected to deplore the entry of Lübeck's English and Dutch competitors. With the stagnation of eastern colonization, attributable in part to the havoc wrought by the Black Death, the estrangement

became further intensified. The old ties which blood relationship had cemented between east and west grew slack, and local interests began to take precedence over those of the league.

The momentous changes in the political structure of Europe accompanying the transition to the modern era had a pernicious effect upon the Hansa, whether they be considered from the point of view of the emergence of national states outside of Germany or from that of the simultaneous virtual disappearance of the Holy Roman Empire. The first gave new and ever more portentous strength to the league's rivals. At the end of the fifteenth century the English bourgeoisie and monarchy united in promoting an aggressive foreign policy against the privileged Hansa; a similar development took place in the Scandinavian countries, while behind the Dutch merchants was arrayed the impressive power recently acquired by the house of Burgundy. Although in any case an organization so loose as the Hansa must have eventually succumbed to these forces, the inevitable result was hastened by the fact that each of the numerous small principalities in the Holy Roman Empire was endeavoring to deprive the towns in its area of the independence which had made their participation in the league possible and to subordinate them to its own government.

Until 1400 the Hanseatic towns because of their superior political organization still possessed greater military resources than the principalities; the supremacy of their fleets on the sea, their command of artillery and of mercenaries, rendered whatever campaigns the princes hazarded futile. But in the fifteenth century they met with less success. So proud a city as Stendal was forced along with all the other Hanseatic towns in Brandenburg to sever connections with the league. At the same time the towns remaining in the narrowing Hanseatic circle began to be rent by internal dissensions. Conflicts between the merchants and the councils, on the one hand, and the craftsmen protesting against what they considered an unjust distribution of the tax burden, on the other, paralyzed their political vigor. Commercial competition grew constantly more intense and less manageable during the century. When Nuremberg, whose commercial prosperity was rapidly increasing during this period, organized separate connections with Flanders and Antwerp in the west and Posen, Latvia, Breslau and Galicia in the east it terminated the Hanseatic monopoly of the exchange of Flemish cloth for eastern furs.

In desperation the league resorted to a series of petty measures against its rivals, multiplying obstacles in the way of merchants who were not citizens of the Hanseatic towns and inaugurating an equally xenophobic policy in staples. These measures so far defeated their intention that they caused Nuremberg to make retaliations, in the course of which Lübeck was superseded by Leipsic as the intermediary in the fur trade. Another decisive factor was the rupture of Hamburg with the league and its concurrence in the establishment of a branch within its walls by the English Merchants Adventurers.

The fact that the Hanseatic League could maintain a brave front in the face of these events was due primarily to the effectiveness of its diplomatic leadership, which continued to arouse awe because it continued to be successful. After every solid economic support of the league had decayed, it enabled the Hanseatic merchants to reap the fruits of the achievements of their daring ancestors. The catastrophe was postponed until the sixteenth century, when the Scandinavian countries, soon followed by England, officially abolished the Hanseatic privileges. But this action amounted to no more than the formal declaration of a fact long recognized, that Europe no longer required the Hanseatic merchants as middlemen. The last Hanseatic diet which assembled in 1669 brought to Lübeck only the representatives of Hamburg, Bremen, Danzig and Brunswick.

Thus the downfall of the Hansa is to be explained entirely by developments within Europe. Contrary to the frequently repeated hypothesis, the power of the league had been broken before the discovery of America and that of the sea route to India began to manifest their effects. After the century of Iberian commercial monopoly they led to a great revival of trade in the Baltic, but it was Holland not the Hansa which profited. The Hanseatic towns were affected by the discoveries only to the extent that they found some compensation for their loss of the northern trade in traffic with Spain. This occurred, however, at a time when they were bereft of all political importance and were playing a minor role in European economic life in the shadow of other powers.

For centuries the Hanseatic League had succeeded in welding northern Europe into an economic unit, although one which never attained complete homogeneity. Its work was primarily but not entirely economic. Even today the aspect of the towns from Soest to Dorpat, particularly

of their churches and town halls, testifies to the extraordinarily close cultural bonds forged by the league. The blood relationship of the populations of these cities has endured through the centuries. From the lower Rhine to the Baltic states the Hanseatic merchants spoke the same Low German tongue. As the leader Lübeck naturally had the most impressive church, the Marienkirche, which served as a model for numerous churches in the east. Lübeck's position as the carrier of all important civilization to Scandinavia and the Baltic states is proved by the large number of altars of Lübeck origin. In turn Lübeck itself owed much to Flemish but later to High German influence. Lübeck, Hamburg and Bremen were received into the German Empire as free cities by virtue of their Hanseatic origin. The administration of these cities retains to this day the characteristic features of the Hanseatic constitutional form—the senate and the governing burgomaster at the head and alongside them the representation of the citizenry. The Hanseatic tradition was also a contributory factor in the creation of the free state of Danzig after the World War.

Haering, Leipsic 1931).

HANSEMANN, DAVID JUSTUS LUDWIG (1790–1864), German capitalist and politician. Hansemann was prominently identified with the movement during the middle of the nineteenth

century for the political liberation and economic development of Germany. He started business life as a small wool merchant in the Rhineland, but the scope of his interests broadened under the influence of economic expansion. He was a pioneer in the organization of fire insurance companies, played a leading part in promoting the great railroads of western Germany and made important contributions to the principles which should guide banks of issue. He served for a short time as president of the Preussische Bank and in 1851 organized the Diskonto-Gesellschaft, one of the first big credit banks in Germany (now combined with the Deutsche Bank). In his political activity and his writings Hansemann fought for relaxation of the absolutism which hampered economic development. He served in the provincial Landtag, strongly influenced the movement for a German customs union and advocated a modified constitutional regime. In 1848 he urged the Prussian monarch to place himself "at the head of German liberty and independence" and served for a few months as minister of finance in the government which "accepted the revolution." Hansemann was a moderate liberal, his objective a constitutional monarchy with strong representation for the propertied middle class.

HANSSEN, GEORG (1809–94), German economist and historian. Hanssen was born at Hamburg. He studied economics and finance under Rau at Heidelberg and August Niemann at Kiel and became a lecturer at the latter university in 1833. After three years in the Danish government service he became professor at Kiel and later taught at Leipsic, Göttingen, Berlin and from 1869 again at Göttingen.

Distinguished both as a statistician and a teacher—among his students were many celebrated German economists of the second half of the nineteenth century—his posthumous fame is based chiefly on his studies in agrarian history. His first interest in the subject arose out of a desire to bring about moderate reforms in his native province. He blazed new trails by emphasizing close observation of the contemporary agra-

rian legal and social conditions as the starting point in explaining historical development—a method followed by Meitzen, Inama-Sternegg, Knapp, Sering and others. The results of his studies on the forms of agricultural settlement, the history of field systems and the abolition of serfdom have been incorporated in the generally recognized scientific material of agrarian history.

HARBORS. *See* PORTS AND HARBORS.

HARDENBERG, KARL AUGUST VON, PRINCE (1750–1822), Prussian statesman. Hardenberg came from an old Hanoverian family. After serving in the courts of Hanover and Brunswick he achieved fame through his enlightened administration of Ansbach and Bayreuth from 1791 to 1798. As the leading minister of Prussia, after the Prussian defeat at Jena he continued the war against Napoleon on the side of the Russians. But the fatal issue of the campaign forced him on the conclusion of the Peace of Tilsit to retire from the government at Napoleon's command.

Hardenberg is chiefly known as the originator, together with Baron vom Stein, of the Stein-Hardenberg reforms in the regeneration of Prussia. After a short year of service Stein was removed from office by Napoleon, and when the successors of the great minister proved to be incapable Hardenberg was appointed chancellor in 1810 and until his death he conducted Prussia's entire policy. Hardenberg's political and social views were the result of a combination of the principles of a government of enlightened absolutism, of the economic views of Adam Smith and the physiocrats and of the ideas of the French Revolution. He continued to carry on Stein's reforms but adhered more closely than his predecessor to the doctrines of 1789. The guilds were abolished and freedom of trade was introduced.

Equality in taxation was enforced by the introduction of a land and a business tax. The *Regulierungsedikte* of 1811 did away with statute labor and effected the allotment of free property to the peasants. The Jews received equal rights in 1812. The greatest advantages from these reforms were gained by the bourgeois capitalists, while they aroused the fierce opposition of the gentry and the traditionalists.

Hardenberg succeeded in guiding the state through all the dangers of foreign policy by refusing to take a definite stand with regard to Napoleon. Even in 1812 he provided auxiliary troops against Russia, but then at the right moment he made a treaty with it and brought about the War of Liberation. At the Congress of Vienna he gained a great extension of territory for Prussia and restored it to its position as a first rate power. He continued to maintain an amicable cooperation with Austria and Russia and for this reason was reproached by the patriots with having made Prussia a vassal of Metternich. Hardenberg strove to steer a middle course between the system of Metternich and the wishes of the patriots. In 1815 he caused the king to hold out the prospect of the introduction of a Prussian parliament, but he did not succeed in redeeming the royal pledge and the execution of the reforms came to a standstill. Many decrees for reform were altered in a reactionary spirit, thereby causing serious differences between Hardenberg and Wilhelm von Humboldt, the leader of the reform party. Worn out by old age and dissipation, Hardenberg offered in the last years of his life no further resistance to the reactionaries.

HARDIE, JAMES KEIR (1856–1915), British labor leader. Hardie went to work in the coal mines before his tenth year. At the age of twenty-four he was elected secretary of a Lanarkshire miners' union and soon became the most influential leader among the Scottish miners. His intellectual and spiritual development involved a temporary affiliation with the Evangelical Union,

the reading of Carlyle, Ruskin and Mill and as a final spur the writings of Henry George. He combined journalism with his trade union work, editing the *Cumnock News* from 1882 to 1886 and then the *Miner*, which was founded in 1887, was changed to the *Labour Leader* and in 1893 became the official organ of the Independent Labour party.

By 1887 Hardie, who began life as a radical, became convinced of the necessity of an independent labor party and in that year attacked the older trade union leaders at the Swansea trades union congress. In 1888 he fought Mid-Lanark as a Labour candidate for the House of Commons, in 1889 founded the Scottish Labour party and in 1892 was elected as one of the first Independent Labour members in Parliament, representing West Ham until 1895. In 1893 he took the leading part in founding the Independent Labour party, which under his inspiration set out to win over the trade unions to socialism and Independent Labour representation in Parliament; it succeeded in 1900 through the formation of the Labour Representation Committee, which in 1906 emerged as the Labour party.

Hardie was a powerful speaker and an excellent journalist with a pungent and homely style. The *Labour Leader* shared with Robert Blatchford's *Clarion* the position of being the most widely read labor journal of its day, and his pamphlets were also of wide influence. His vigorous if simple conception of socialism made a deep impression on the British working class. His socialism was mainly a denunciation of capitalism and an insistence on the human rights of ordinary men and women. He could hit hard and made plenty of enemies; and he had a love of shocking bourgeois opinion, as when he appeared in the House of Commons in his early days in a cloth cap and workman's clothes. A most skilful organizer, he built up the Independent Labour party into a real power and widened the appeal of socialism by abandoning the theoretical language of Marxism for a simple appeal which fitted in with the British tradition and was readily intelligible to all. As a parliamentary leader he was less successful; for in spite of his shrewdness and tactical ability he was essentially a propagandist. At first leader of his party in the House, he was later replaced by Ramsay MacDonald; with the latter, against the majority of the Labour party, Hardie opposed the war in 1914. But the creation of the Labour party on the basis of an alliance between trade unionism and socialism was primarily his work. He re-

mained one of its most influential members and was virtually leader of its Left wing. More than any other man he remains the traditional hero of British labor.

HARDWICKE, FIRST EARL OF, PHILIP YORKE (1690-1764), lord chancellor of England. Hardwicke held the great seal from 1737 to 1756 and after 1743 was the most powerful member of the government. In 1754 he was created earl and he retired in 1756. To his work as lord chancellor Hardwicke brought a thorough knowledge of the Roman civil law, upon which he could draw in cases without precedent. He also made a study of the historical development of the equitable jurisdiction of the chancellor, which was of great value to him in the exercise of his office. Although he was active in political matters he did much to rescue the administration of justice from the bad conditions into which it had fallen. Nevertheless, as Kerly observes in his history of equity, he did a disservice to his court in delaying important judgments for long periods of time in order to hear fresh arguments, with the result that he accumulated an insuperable arrear of cases. It is in connection with the development of equity as a system of law that Hardwicke's influence was the greatest. Lord Ellesmere and Lord Nottingham, who preceded him as chancellors, had taken some steps toward introducing into equity the idea that decisions were to be based upon principles derived from prior decisions, but it was only under Hardwicke's able administration that this movement really took definite shape. In a letter to Lord Kames, written after Hardwicke had resigned the chancellorship, is to be found a good statement of his views of the regulated discretion of the chancellor. When he had finished his work nearly all the great branches of equity jurisdiction were fairly mapped out. In the reports of his decisions authority is found on most of the important problems of equity, authority that was the chief reliance of subsequent chancellors until after the time of Lord Eldon.

HARET, SPIRU (1851-1912), Rumanian educational and agrarian reformer. Haret was born at Jassy, the son of a minor official. In 1878 he was the first Rumanian to get a doctorate in mathematics at the Sorbonne. He became professor of mechanics in the University of Bucharest, held various educational positions and was thrice minister of education. He combined his mathematical training with social interests in *La mécanique sociale* (Paris 1910), a discussion of the use of mechanistic principles in the study of social evolution.

In 1884 as inspector of schools he submitted a devastating report on the prevailing educational system. Under his influence and later under his direction Rumanian secondary education was systematically overhauled by the law of 1898 on lines which in general still persist. He encouraged the creation of technical schools and his reports form the best critical history of Rumanian education.

The formal changes which Haret introduced were less important than the social content which he instilled into education. He looked upon the school as an organ of the nation's life, deriving inspiration from it and contributing directly to its enrichment. He sought to raise the standard and status of the teachers and to encourage extramural activities. He urged rural teachers to combat ignorance in the village as well as in the school and instituted teachers' regional conferences. Realizing that educational effort was wasted on a materially miserable population he became a pioneer of peasant cooperation. Whereas previously village teachers had been persecuted and even imprisoned for cooperative activities, Haret sent several abroad to study the movement and appointed others to teach cooperative principles to rural schoolmasters.

His attitude developed into a championship of the cause of the oppressed peasantry. He advocated the settlement of the peasants as tenants with the possibility of later becoming owners through direct purchase. In a famous pamphlet in 1905 he predicted their revolt. The accusation was made against him by many that he was morally responsible, together with his

reforming teachers, for the great peasant rising of 1907.

HARMEL, LÉON (1829-1915), French industrialist and social worker. In 1841 Harmel's father, Jacques-Joseph, founded a factory at Val-des-Bois near Reims, where he endeavored to establish along with numerous philanthropic and social enterprises a strong Catholic discipline among the workers. As director of the factory after 1854 Léon Harmel became convinced that in social work the initiative of the workers rather than authority must be appealed to, since the workers would not interest themselves in benevolent movements unless given a responsible share in directing them. Harmel therefore established numerous associations, all strictly Catholic in principle but each directed by a council of workers.

Harmel was in touch for several years with Albert de Mun, the principal inspirer of the Catholic workmen's circles founded on the authoritative idea of protection of the workers by the controlling classes, and did much to bring him toward more democratic ideas. Harmel sought papal approval and, although Pius IX praised his work, it was chiefly Leo XIII who throughout his pontificate publicly approved and encouraged him. Bishops from all countries visited and admired Val-des-Bois. To strengthen the popularity of Leo XIII, Harmel organized pilgrimages of French workmen to the Vatican in 1887, 1889 and 1891. He greeted the encyclical *Rerum novarum*, dealing with the condition of the working class, as the consecration of his ideas and approved Leo XIII's advice to Catholics to support the French Republic.

In his factory he supplemented departmental workmen's councils by a *conseil d'usine*, which gave instruction in the general management of the enterprise. He approved legislation on industrial accidents and compulsory retirements. With the aid of Cardinal Langénieux of Reims he organized Christian working men's congresses in that city in 1893 and 1894. Popular among social Catholics, Christian democrats and the Sillon group, to whom he was *le bon père*, he was repeatedly attacked by conservative Catholics for encouraging advanced ideas of Christian democracy and by royalist Catholics for supporting the republic. Some church leaders were dis-

quieted by new tendencies appearing among the young clergy, and Bishop Turinaz of Nancy held Harmel chiefly responsible for them. Finally, although some Catholic capitalists regarded his ideas as an excellent bulwark against the spread of socialism, the well organized northern Catholic industrialists criticized his factory system and his attitude toward social legislation. When Pius x, the successor of Leo XIII, condemned almost all the organizations Harmel supported, he bowed as always to the wishes of Rome. Although the pope treated him thereafter with much consideration, Harmel never regained his former influence. Shortly before the death of Pius x in 1914 he went to Rome to defend the Christian trades unions.

GEORGES WEILL

Important works: *Manuel d'une corporation chrétienne* (Tours 1877, 2nd ed. 1879); *Le catéchisme du patron* (Paris 1889), adapted translation by Virginia M. Crawford as *A Key to Labour Problems* (London 1896).

Consult: Guitton, Georges, *Léon Harmel 1829-1915*, 2 vols. (Paris 1927); Lecanuet, E., *La vie de l'église sous Léon XIII* (Paris 1930); Moon, P. T., *The Labor Problem and the Social Catholic Movement in France* (New York 1921).

HARNACK, ADOLF VON (1851-1930), German church historian. After teaching at the universities of Leipzig, Giessen and Marburg, Harnack was called to Berlin in 1888 at the personal request of Prince Bismarck. There he came to be regarded as one of the chief representatives of German science during the reign of Emperor William II. He was a prominent and influential member of the Preussische Akademie der Wissenschaften, the history of which he wrote, and was director of the royal library and president of the Kaiser Wilhelm-Gesellschaft zur Förderung der Wissenschaften. He was a man of wide learning. In his special field he proceeded from a most detailed philological interpretation of texts to an analysis of the thoughts and ideals of an epoch. His historical studies have a philosophical character which reflected the German religious tradition of his day. The nature of this tradition he analyzed in his lectures *Das Wesen des Christentums* (Leipzig 1900; tr. by T. B. Saunders, 3rd rev. ed. London 1904). In *Reden und Aufsätze* (4 vols., Giessen 1904-23) he treated problems of history and sociology and various contemporary questions and attempted to demonstrate the important place of Christianity in the evolution of the human race. His famous *Lehrbuch der Dogmengeschichte* (3 vols., Freiburg 1886-90, new ed. Tübingen 1909-20;

tr. by N. Buchanan and others, 7 vols., London 1895-99) discussed the influence of Greek thought on Christian dogma of the fourth and fifth centuries and showed that it had been amalgamated with Christian thought in liturgy, church constitution, dogma and morals—not as apostasy, but as a necessity for a religion which was ambitious to conquer the Roman Empire. In *Die Mission und Ausbreitung des Christentums in den ersten drei Jahrhunderten* (Leipzig 1902, 4th ed. 2 vols. 1923; tr. by J. Moffatt, 2 vols., 2nd rev. ed. London 1908) he discussed the structure of the early Christian communities, treating especially the necessity for church law and the ideas of the early Christians concerning social work and property. As president of the Evangelical-Social Congress from 1902 to 1912 he was active in social work.

W. KÖHLER

HARNEY, GEORGE JULIAN (1817-97), English journalist and political agitator. Harney began his revolutionary career as a shopboy for the radical journalist, Henry Hetherington, and was imprisoned for selling unstamped literature. In 1838 he was one of those who withdrew from the London Working Men's Association, after a quarrel with more moderate leaders, to form the Democratic Association; and he wrote fiery editorials for the London *Democrat*. He became editor of O'Connor's *Northern Star* in 1843. In 1847 he won the nomination as Chartist candidate against Lord Palmerston. Although one of the most prominent Chartist leaders in the "physical force" wing from the beginning of the movement to the end Harney was not one of the ablest. He lacked the intellectual distinction of William Lovett and Thomas Cooper among the moderates or of James Bronterre O'Brien and Ernest Jones among the radicals, and he never enjoyed a personal ascendancy such as fell to the lot of O'Connor. But more than any other agitator of the time he represented a combination of the Jacobin tradition of the continent and the trend of English working class radicalism toward the formulae developed by Marx.

Even more than most Chartists Harney was keenly interested in contemporary revolutionary movements. He joined the communist German

Working Men's Club and was an organizer of the international Society of Fraternal Democrats (1845-53), with which Marx and Engels at first cooperated. After 1848 his emphasis on foreign events led to a quarrel with O'Connor and he eventually started organs of his own, the *Democratic Review* and the *Red Republican*, later the *Friend of the People*, which published the first English translation of the *Communist Manifesto*. Harney's communism was that of his sometime friend Ernest Jones. After their quarrel in 1852 his activities met with failure and in 1860 he emigrated to Boston. Communist historians such as Rothstein consider him a forerunner of the First International.

HARRIMAN, EDWARD HENRY (1848-1909), American railroad magnate and financier. Harriman played a conspicuous role in the consolidation of American railroads. He bought a seat on the New York Stock Exchange in 1870 and some years later became a director and vice president of the Illinois Central Railroad. The many railroad bankruptcies of the period, caused mainly by financial exploitation and mismanagement, provided Harriman with an opportunity to enlarge his interests by the reorganization of several bankrupt railroads. By secret opposition and manipulation he forced himself in 1897 into the syndicate reorganizing the Union Pacific, of which he retained control and which he developed into an extremely efficient and profitable enterprise. He used the Union Pacific's large resources as well as the resources of banks, insurance companies and trust companies under his influence to secure control of other lines until the Harriman system included 60,000 miles of railroads. This system, the largest of its kind, was held together by consolidations, interlocking directorates and "community of interest." His operations assumed an international character; he secured a concession to build a railroad in Mexico, waged an aggressive struggle against Japanese interests for control of the South Manchuria Railway (in which he had American diplomatic support) and projected a ship and rail line encircling the world.

The rise of Harriman met with the opposition of rival interests. A struggle with the Morgan-Hill group for control of the Northern Pacific resulted in the disastrous stock market panic of 1901—an episode which strengthened the public demand for more stringent government regulation of the railroads. Harriman became the target of increasingly numerous attacks, part of the growing public revolt against combinations and trusts. He was severely criticized in a report of the Interstate Commerce Commission, which accused him of "indefensible financing" and of "crippling" and "scuttling" the reorganized Chicago and Alton Railroad Company; the commission declared, however, that no existing law had been violated. President Roosevelt, with whom he had been on friendly personal and political terms, denounced Harriman as an "undesirable citizen" and an "enemy of the Republic." A government suit broke up the Harriman system by compelling the Union Pacific to divest itself of stocks in five other railroads.

Harriman was probably the ablest of the railroad magnates; his consolidations were usually sound and he encouraged operating efficiency. But the system he created was primarily financial in character; and his predatory manipulations, characteristic of the age, constituted a strong influence in the development of more comprehensive regulation by the Interstate Commerce Commission.

LEWIS COREY

Consult: Kennan, George, *E. H. Harriman*, 2 vols. (Boston 1922); United States, Interstate Commerce Commission, "In the Matter of Consolidations and Combinations of Carriers" in *Reports*, vol. xii (1907) p. 277-306; Corey, Lewis, *The House of Morgan* (New York 1930).

HARRINGTON, JAMES (1611-77), English political philosopher. Although a convinced republican Harrington remained neutral during the civil war and from 1647 to 1649 was in personal attendance on Charles I in his captivity. His chief work, *The Commonwealth of Oceana* (London 1656), is a treatise on comparative politics—partly philosophic, partly utopian, partly historical. The utopian model of a commonwealth which it presented exerted great influence. The "constitution," set up by a special constituent body, consisted of an elective "senate," which alone might debate, and "the People," or elected deputies, who alone might decide broad questions put to them by the senate or the executive councils, appointed by indirect election. The whole system was based on election,

rotation, the use of the ballot and the separation of functions. It was superimposed upon an elaborate organization of local government and an equal division of landed property. Harrington laid particular stress on agrarian conditions and on the changes in the balance of power consequent upon redistribution of land. The Tudors, he believed, had provoked the civil war by throwing the balance of property into the hands of the middle classes. No man ought to receive more than £2000 in land by bequest, and family lands ought to be equally divided. For the small landowner Harrington showed little concern; he was an aristocratic republican with a strong belief in "the genius of a gentleman." He had a far reaching conception of empire. "To ask whether it be lawful for a Commonwealth to aspire to the empire of the world, it is to ask whether it be lawful for it to do its duty, or to put the world into better condition than it was before." Harrington's political thought appears to have owed something to Plato's *Laws*, much to Machiavelli and to Bacon, much also to his general historical reading and knowledge of contemporary European politics. He is original in that he makes no use of the social contract, and his whole attitude toward Hobbes is one of hostility. Locke's theory of property probably owes something to Harrington.

It was in America that Harrington's influence was strongest. The written constitution, the unlimited use of the elective principle and the separation of powers are all points which may have been derived directly from the *Oceana*, while all the minor points of machinery, rotation, checks and balances, popular ratifications and special protection for the constitution seem to have been first formulated by Harrington. His influence is best seen in the early constitutions of the proprietary colonies, Carolina, New Jersey, Pennsylvania. Although incapable of direct proof it seems a "moral certainty," according to Russell Smith, that Penn derived his leading ideas direct from Harrington and not from an independent study of continental parallels. Harrington's favorite devices did not prove a success in the separate colonies, but there was a sharp recrudescence of his influence in the American Revolution, when his principles were esteemed more highly than his devices. A few years later his works were translated into French and read by some of the revolutionary leaders, notably by Sieyès; some of his practical ideas, such as the ballot, were ultimately worked out by the English radicals; and thus he serves

to link together four revolutions of very different types. The most valid criticism of Harrington is that he makes no adequate definition of the end toward which a state should strive; or, as Montesquieu put it, "for want of knowing the nature of real liberty, he busied himself in the pursuit of an imaginary one."

HARRIS, JOSEPH (1702-64), British monetary theorist. Harris is said to have been a blacksmith in his native village. He moved to London at an early age, where he became known as a writer on navigation, trigonometry, optics and astronomy. He was appointed assay master in 1748. His contribution to monetary theory is contained in his *Essay upon Money and Coins* (2 vols., London 1757-58), which deals with the general theory of money and exchange and with evils of debasement. It is clearly and intelligently written and reflects Harris' familiarity with current theory and practise, but his views on the fundamental questions show no great originality. In the excellent introductory chapter on the nature of wealth and commerce there are indications that he was acquainted with the work of Cantillon and other liberal critics of traditional mercantilism; in the chapters on money the influence of Locke is more marked.

Harris was strongly in favor of silver monometallism. Gold coins may be used as a medium of payment but not as standard money; copper may be used for subsidiary coins in strictly limited amounts. He adopts Locke's version of the quantity theory but holds that the cost of producing the money metal is also a factor in its value, although less directly than in the case of other commodities. Production at the mines is checked by the falling value of bullion. The supply of money adjusts itself automatically to the

needs of a trading country, but something in excess of this amount may well be held as a "dead stock" for emergencies.

Consult: Monroe, A. E., *Monetary Theory before Adam Smith*, Harvard Economic Studies, vol. xxv (Cambridge, Mass. 1923).

HARRIS, WILLIAM TORREY (1835-1908), American educator. Harris was the author of many philosophical papers and a book on Hegel's logic. He translated writings of Hegel and other European philosophers, edited the *Journal of Speculative Philosophy* from 1867 to 1893 and held several administrative posts.

Harris was less of a philosopher than a teacher and educational administrator. Although he favored some pronounced changes in education—the higher education of women, science in the school curriculum, learning through investigation and discovery rather than textbook cramming, reconstruction of the curriculum, better training of teachers, better school buildings and organization—in making his case for such reforms he always stressed the conservative factors involved. He was in educational theory primarily a classicist, in morals a puritan, in theology an orthodox Christian, in philosophy an absolutist. In social, political and economic theory he was a Hegelian institutionalist, a pronounced nationalist, a strong individualist and a defender of the status quo of the economic order.

His philosophy, in effect a rationalization of the more generally accepted moral, social and political standards of his times, failed to appreciate the needs of the future. But he did important service in his day by stimulating the minds of his generation to fundamental thinking and by interesting a wide and varied audience in pedagogical problems, especially through his addresses before the National Education Association, of which he was a leading member, and his reports made as superintendent of schools in St. Louis from 1867 to 1880 and as national commissioner of education from 1889 to 1906. The numerous practical improvements which Harris introduced into the school system of St. Louis were very widely copied throughout the United States.

HARRISON, FREDERIC (1831-1923), English humanitarian jurist and man of letters. Following a decade of law practise Harrison gave himself to an abounding activity as a publicist. His long and full life was externally uneventful, as he neither sought nor accepted public honors. The strict Anglicanism in which he had been reared, shaken by his education at Oxford, gradually gave way to Comte's religion of humanity based on a positivist (scientific) philosophy of a progressive society. Harrison's place in English positivism was pivotal; for twenty-five years he was president of the English Positivist Committee; he was one of the founders of the *Positivist Review*. Positivism, "the real business" of his life, was to Harrison a social religion and a religious socialism. It stimulated him to manifold humanitarian activity and to the propagation of broad views that became increasingly accepted with the years.

His legal interests were important for a time. For many years he was a lecturer to the Inns of Court on jurisprudence and international law, and he assisted in the digest of the law. His *On Jurisprudence and the Conflict of Laws* (Oxford 1919) was influenced by Sir Henry Maine and did much to dissolve the extremely analytical character of English legal thought. His legal career came to an end, however, in the early seventies because of too keen an advocacy of the trades unions. He was a member of the Royal Commission on Trades Unions from 1867 to 1869 and author of the minority report, and he was largely responsible for the legal position granted the unions in the seventies. But he was not a socialist in the accepted sense. Marxian doctrines seemed to him "utterly incoherent"; Harrison's vehemence for social reconstruction was not revolutionary.

Broad in his international viewpoint, Harrison consistently advocated the rights of "little peoples" and subject races. The Sepoy Mutiny made him an anti-imperialist and he boldly opposed the occupation of Egypt, the dismemberment of China, the Boer War and the coercion of Ireland. To the jibe "little Englander" he retorted by accusing the "prancing" imperialists of the "low-bred pride of being big." Yet he was a deeply patriotic islander, whose popularity in

his old age was enhanced by his enthusiastic espousal of the cause of the Allies in the World War. It should be added that he vigorously denounced a peace based on annexations and indemnities.

Harrison's voluminous articles and books have been widely read; in them sound judgments, historical, social and literary, are joined to a clear and vigorous style of writing. His reminiscences, the most valuable of which are *The Creed of a Layman* (London 1907), *Autobiographic Memoirs* (2 vols., London 1911, with a bibliography of his writings) and *De senectute* (London 1923), reveal him as one of the last of the great Victorians.

HOWARD ROBINSON

Consult: Harrison, Austin, *Frederic Harrison; Thoughts and Memories* (London 1926); Pollock, Frederick, "Frederic Harrison, Jurist and Historian" in *English Review*, vol. xxxvi (1923) 410-13.

HARRISON, JANE ELLEN (1850-1928), English archaeologist and comparative religionist. Jane Harrison, who had been for some time an interested student of classical antiquity, especially Greek art (*Myths of the Odyssey in Art and Literature*, London 1882; *Introductory Studies in Greek Art*, London 1885, 3rd ed. 1894; *Mythology and Monuments of Ancient Athens*, with M. de G. Verrall, London 1890; *Greek Vase Paintings*, with D. S. MacColl, London 1894), turned to the study of Greek religion "with the definite hope," she says (*Prolegomena*, p. viii), "that I might come to a better understanding of some forms of Greek poetry." Her literary interest never left her and it adds to the charm of her style and the piquancy of her arguments. Her first important work in her new field, *Prolegomena to the Study of Greek Religion* (Cambridge, Eng. 1903; 3rd ed. 1922), was widely read and exercised a great influence: it perhaps turned the attention of English scholars to the earlier forms of Greek cult and thought more than any other book, even the works of Andrew Lang. At that time under the inspiration of E. B. Tylor's theory of animism the influence of the school of "philological ethnologists," including such men as Usener, Rohde and Dieterich, was strong. It is thus not surprising that Jane Harrison was led to trace much in popular Greek cult to the worship of ghosts and other underworld spirits. It is also significant that a second work, *Themis; a Study of the Social Origins of Greek Religion* (Cambridge, Eng. 1912; 2nd ed. 1927), appeared in the same year as Durkheim's *Les*

formes élémentaires de la vie religieuse, for the hypotheses of his school play a great part in *Themis*. In it Jane Harrison endeavors to deduce certain Greek rites from initiation ceremonies and to trace the gods worshiped in them to "projections" from the worshipping community which embody its hopes for a prosperous year. The World War turned her attention to Russian studies but she returned to her main interest in *Epilogomena to the Study of Greek Religion* (Cambridge, Eng. 1921), which shows the influence of the Freudian school. Despite hasty conclusions and uncritical survey of material her work forced students of Greek and comparative religion "to reexamine and deepen the foundations of their thinking."

H. J. ROSE

Consult: Murray, Gilbert, *Jane Ellen Harrison* (Cambridge, Eng. 1928).

HART, SIR ROBERT (1835-1911), administrator in the Chinese service. Hart was a native of Ireland. After he had attended school in Belfast and had served in the British consular service in China from 1854 to 1859 Hart entered the Chinese Imperial Maritime Customs, becoming in 1863 inspector general, an office he held until his death. He organized and developed the service, drawing on all the competing European nationalities for his subordinates. He had the confidence of both the imperial Chinese and the foreign governments and was honored by both for his services. He centralized and standardized maritime customs administration. Although hampered by a low rate treaty tariff he increased the revenue and made it the most dependable security for government borrowing. Hart made the maritime customs an instrument for modernization. The coast was lighted and the river channels buoyed. A customs postal service grew into the national post office. A school of European languages became a national university. His port physicians developed a public health service. Staff researches produced important historical and economic studies. The customs statistics were and are the most reliable obtainable upon Chinese affairs.

Consulted by the Chinese government in every great emergency, Hart's memorials dealt with political as well as fiscal matters. He was largely responsible for the appointment of the Burlingame Mission and the establishment of Chinese legations and consulates abroad. His influence was always exerted in behalf of peace and friendly relations with the West. In 1885

he declined the post of British minister to China. He died while on leave in England.

HARTLAND, EDWIN SIDNEY (1848-1927), English anthropologist. Although a busy lawyer practising at Swansea between 1871 and 1890 and later serving as registrar of the County Court at Gloucester, Hartland was one of the leading British anthropologists of his generation. His work comprises an earlier period, during which he was mainly concerned with the history of folk tales, and a later, when he went on to explore primitive culture not so much as a key to its survival in folklore as for its own sake. He was associated with the Folk-lore Society from the time of its inception in 1878, was a frequent contributor to its organ *Folk-lore* and published a number of books on fairy tales and mythology. In his very valuable *The Legend of Perseus* (3 vols., London 1894-96) he not only discusses that folk story in the light of its diffusion but likewise labors to connect each incident with some trait of a preexisting primitive culture. His later books on the origins of the family, *Primitive Paternity* (2 vols., London 1909-10) and *Primitive Society* (London 1921), vigorously support the theorists who maintain the priority of mother right to father right. In *Ritual and Belief* (London 1914) he showed himself to be an eminently judicious thinker, thoroughly abreast of the best and latest work on comparative religion. His *Primitive Law* (London 1924), in which he regards primitive law as the totality of the customs of the tribe, provides a helpful compact outline of a difficult subject. Hartland's friendliness, moderation and tact endeared him to all who knew him and inspired his coworkers to maintain the unity and direction of their common studies.

R. R. MARETT

Consult: Haddon, A. C., in *Folk-lore*, vol. xxxvii (1926) 178-80, and bibliography based on Hartland's own record, 180-92; Marett, R. R., in *Folk-lore*, vol. xxxviii (1927) 83-85; Myres, J. L., in *Man*, vol. xxvii (1927) 143-47; Goldenweiser, Alexander, in *American Anthropologist*, n.s., vol. xiii (1911) 598-606.

HARTLEY, DAVID (1705-57), English psychologist. Hartley was educated at Jesus College, Cambridge. He planned to follow his father's profession as a clergyman but deterred by doctrinal scruples became a physician. Hartley is recognized as the founder of the English association psychology. Taking from John Locke the notion of mental association and from John Gay the idea of its potency he elaborated in his epoch making *Observations on Man, His Frame, His Duty and His Expectations* (2 vols., London 1749; ed. with biography and commentary by D. Hartley, Jr., 3 vols., 1791) a theory of association based on brain activity and nerve physiology. He was the first to formulate a general law which interpreted all mental phenomena (except sensation) and all voluntary activities as the result of association working through temporal contiguity. He developed his theory in the manner of Spinoza in a series of formal propositions followed by expositions. The physiological basis of association he explained by an elaborate theory of brain vibrations. In the second volume of the book he applied the association psychology to ethics and theology.

Hartley's work at first received scant notice in England, but it had great influence on English psychology in the nineteenth century as the source of the association psychology of James Mill and his successors.

HOWARD C. WARREN

Consult: Bower, G. S., *Hartley and James Mill* (New York 1881); Brett, G. S., *A History of Psychology*, 3 vols. (London 1912-21) vol. ii, p. 278-86; Warren, Howard C., *A History of the Association Psychology* (New York 1921) p. 50-64.

HARTMANN, EDUARD VON (Karl Robert) (1842-1906), German philosopher. After military training and five years' service as an army officer Hartmann resigned his commission because of a knee infection which kept him an invalid for long periods during his life; he then studied at Rostock, whence he returned to his birthplace, Berlin. Although Hartmann's philosophy suggests psychoanalysis and in a sense he must be regarded as the forerunner of Freud, he was primarily a metaphysician. Just as Schopenhauer's Will was not a psychological entity but a cosmic principle, so Hartmann's Unconscious corresponded to the Absolute working itself out in every human endeavor through the individual and becoming more and more conscious in the process. Hartmann's important work, *Die Philosophie des Unbewussten* (Berlin

1869; tr. by W. C. Coupland, new ed. London 1931), was a synthesis of the systems of Hegel and Schopenhauer. With Hegel, Hartmann believed that the Absolute is idea in essence; with Schopenhauer he invested this idea with will. At the same time he insisted upon the principle of the unconscious, which runs throughout Schelling's transcendentalism. Hartmann styled his own system transcendental realism on the supposition that he had completely veered from the subjective idealism of his predecessors. In his theory of knowledge he drew the distinction between category concepts and category functions.

The keynote of Hartmann's ethics, which resembled Schopenhauer's because both were imbued with oriental mysticism, was pessimism. While, however, Schopenhauer bitterly flouted the illusion of happiness, Hartmann urged it as a substitute. He explained pain and misery through the relationship between the will and the idea; the *summum bonum* of man he conceived to be only in the denial of the individual in order to serve the purpose of the Unconscious—a self-denial which made for the absorption of the Absolute and the final release from the wretched condition of existence. Hartmann's own physical suffering was undoubtedly responsible for this philosophy, in terms of which he considered Christianity an early stage in the development of a true religious consciousness.

Hartmann, especially conversant with contemporary biology and psychology, prepared the way for neovitalism. He served as a storm center in philosophical circles for a quarter of a century, wielding influence in Russia, France and England and in Scandinavian countries.

A. A. ROBACK

Works: Von Hartmann's selected works have been published as *Eduard von Hartmanns ausgewählte Werke*, 13 vols. (vol. i 3rd ed., vols. ii-vii 2nd ed., vols. viii-xiii 1st ed. Berlin and Leipsic 1885-1901).

Consult: Überweg, Friedrich, *Grundriss der Geschichte der Philosophie*, 4 vols. (11th-12th eds. by T. K. Oesterreich, Berlin 1923-28) vol. iv, p. 331-41, with bibliography; Drews, Arthur, *Eduard von Hartmanns philosophisches System im Grundriss* (2nd ed. Heidelberg 1906); Fischer, J. C., *Hartmanns Philosophie des Unbewussten* (Leipsic 1872); Hessen, Johannes, *Die Kategorienlehre Eduard von Hartmanns* (Leipsic 1924); Kappstein, T., *Eduard von Hartmann* (Gotha 1907); Koeber, R., *Das philosophische System Eduard von Hartmanns* (Breslau 1884); Petraschek, K. O., *Die Logik des Unbewussten*, 2 vols. (Munich 1926); Plümacher, Olga, *Der Kampf ums Unbewusste* (2nd ed. Leipsic 1890); Steffes, J. P., *Eduard von Hartmanns Religionsphilosophie des Unbewussten* (Mergentheim 1921); Hall, G. S., *Founders of Modern Psychology* (New York 1912) p. 181-243.

HARTMANN, LUDO MORITZ (1865-1924), Austrian historian, sociologist and statesman. Hartmann began his scholarly career under the influence of Mommsen with a work on Roman history. Later, influenced by Sickel and Scheffer-Boichorst, he turned to early mediaeval history, especially that of Italy. His *Untersuchungen zur Geschichte der byzantinischen Verwaltung in Italien* (Leipsic 1889) revealed all the qualities of Hartmann's later work: complete mastery of available sources, a keen critical sense, clear exposition, able synthesis and the desire to place social and economic problems in the forefront. Hartmann edited many sources and published numerous monographs and popular works on mediaeval and modern Italian history. His most important historical work, however, was his *Geschichte Italiens im Mittelalter* (4 vols., Leipsic and Gotha 1897-1915; vol. i, 2nd ed. Gotha 1923), which treats of the period between the fall of Rome and the year 1018 and is especially illuminating on the policy of Justinian, on the relations between the Byzantine and western empires and on the internal organic weaknesses of the Carolingian empire. In 1893 Hartmann together with Stephan Bauer, Carl Grünberg and Emil Szanto founded the *Zeitschrift für Sozial- und Wirtschaftsgeschichte*, which in 1903 became the *Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte*, and he remained until his death one of its editors and most active contributors. He was also the editor of the *Weltgeschichte in gemeinverständlicher Darstellung* (vols. i-vii, x, Gotha 1919-25), to which he contributed the sections on the early history of Rome and the decline of the ancient world.

As a sociologist Hartmann was interested in the problems of nationality, political action and the sociology of revolution but above all in the principles of historical method and research. As a young man he believed that there were demonstrable laws in history but later he spoke rather of historical tendencies. Inspired by Marx, Darwin and Mach he wrote his *Über historische Entwicklung* (Gotha 1905), in which he developed the fundamental idea that the law of history is the extensive and intensive development of socialization. The destiny of a state is determined not by the deeds of individuals but by forces deeply rooted in the people.

Hartmann was not content with a life restricted merely to scholarship and research. The ideas of a republic and of democracy, impressed upon his mind from his earliest youth and providing the basis for his social outlook, inspired his activity

as popular educator, organizer and political leader. He was a prominent socialist and particularly active in attacking clericalism and limitations on the freedom of research. He organized the Freie Schule, the Volksbildungsverein, the Athenäum für Frauen and the Volksheim—all of them institutions where the working classes of Vienna could satisfy their thirst for culture. After the collapse of the empire Hartmann became director of the national archives and made possible the first publication of the diplomatic documents concerning the outbreak of the World War. He was the first ambassador of the Austrian Republic to Germany and worked until his death for the union of the two countries.

ALFRED FRANCIS PRIBRAM

Consult: Bauer, Stephan, in *Neue österreichische Biographie*, ed. by Anton Bettelheim, sect. i, vol. iii (Vienna 1926) p. 197-209; Stein, E., Ciccotti, E., Salvioli, G., and Bauer, S., in *Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte*, vol. xviii (1924-25) 312-39, with a list of Hartmann's historical works.

HARVEY, GEORGE BRINTON McCLELLAN (1864-1928), American publicist and diplomat. Harvey was reared in poverty in a Vermont village and learned early to admire material success. After some journalistic work on the Springfield (Massachusetts) *Republican*, then a good training institution, and on Chicago newspapers he became managing editor of the New York *World* and was influential in the 1892 campaign for the nomination and election of Cleveland. Leaving the *World* he was enabled through William C. Whitney and Thomas F. Ryan to acquire a considerable competence through speculations in electric traction lines and thereafter to buy the *North American Review*. He was chosen by the elder J. P. Morgan to manage the publishing firm of Harper's, whose bonds the house of Morgan had underwritten. He manipulated the nomination of Woodrow Wilson as governor of New Jersey in 1910 and as editor of *Harper's Weekly* assisted in his election. Making a shrewd analysis of Wilson's "availability" as a presidential candidate Harvey groomed him and boomed him as "predestined" for the presidency in a manner which showed his mastery of the technique of publicity and of convention tactics. A break occurred, however, between Harvey and Wilson. Harvey, mercurial politically, jumped to the Republicans and established in connection with the *North American Review* a "war weekly" which dealt candidly with the origins of the World War and the ideals of the belligerents. As *Harvey's Weekly* it be-

came a venomously personal anti-Wilson sheet, written in the tone and temper of certain early English pamphlets, and waged a bitter and effective fight against American entrance into the League of Nations. Harding, whom Harvey helped to the presidency, appointed him ambassador to Great Britain, a post in which his audacity caused frequent embarrassment to his government.

As president maker, political analyst and strategist and master of publicity and public relations Harvey had considerable significance despite the fact that his influence on American thought was essentially destructive. He was politically unpredictable but had the capacity for marshaling all sorts of factions in support of the idea which obsessed him at the time. He illustrates as well as any figure in American history what results when an intelligent and irresponsible journalism that knows what it wants projects itself into the realm of national and international affairs. In the main Harvey identified the drives of his personality with the destinies of the nation.

SILAS BENT

Consult: Gilbert, C. W., *The Mirrors of Washington* (New York 1921) p. 49-63; Dodd, William E., *Woodrow Wilson and His Work* (4th rev. ed. New York 1921) ch. v; Johnson, W. F., *George Harvey* (Boston 1929).

HASBACH, WILHELM (1849-1920), German economist. Hasbach studied at the universities of Münster, Bonn and Tübingen; his later studies in Berlin brought him under the influence of Gustav Schmoller and Adolf Wagner. He was lecturer at the universities of Greifswald and Königsberg and from 1893 to 1906 professor at Kiel. Hasbach's significance lies in the field of modern English economic history. His work *Die englischen Landarbeiter . . . und die Einhegungen* (Leipsic 1894, tr. by Ruth Kenyon as *A History of the English Agricultural Labourer*, London 1908) is a masterpiece of historical research. It is an original study of agrarian changes in the England of the eighteenth century, the social effects of the enclosures and the origin of the landless rural working class. Equally significant are *Das englische Arbeiterversicherungswesen* (Leipsic 1883), a treatise on social insurance in Great Britain; *Die allgemeinen philosophischen Grundlagen der von François Quesnay und Adam Smith begründeten politischen Ökonomie* (Leipsic 1890) and *Untersuchungen über Adam Smith* (Leipsic 1891), two penetrating studies of the

driving force of the philosophy of Smith and its relationship to the philosophies of the seventeenth and eighteenth centuries. As a theorist Hasbach failed, however, to show that gift of criticism which distinguished him so highly in the writings on economic history and the history of economic thought; he was less successful in his study of commodity consumption and production, *Güterverzehrung und Güterhervorbringung* (Jena 1906). In his last work, *Die moderne Demokratie* (Jena 1912, 2nd ed. 1921), he showed himself to be an outspoken enemy of parliamentarism and an unconditional adherent of constitutional monarchy resting on a strong bureaucracy. The book reveals the conservative influence of his teachers Schmoller and Wagner. These two, however, in their aversion to democracy never expressed themselves so openly and sharply as did Hasbach.

HERMAN LEVY

HASTINGS, WARREN (1732-1818), British colonial administrator. After a brilliant career at Westminster School, Hastings in 1750 went out to Calcutta in the East India Company's service. Distinguished by the purity of his conduct, he became governor of Bengal in 1772. He introduced numerous reforms into the administration, but his conduct of external policy was open to criticism. In 1774 he became governor general under the Regulating Act, the well intended but unwise provisions of which involved him in a number of acute conflicts. The new council at once attacked not only his external policy but also his internal administration, accepting at their face value the uncorroborated accusations of the Brahman Nandakumar. When Nandakumar was tried and executed on a charge of forgery, Philip Francis, the leading spirit of the opposition, sought to represent this as a judicial murder. But this charge although accepted by Macaulay was rejected by the House of Commons and is discredited by modern research. Hastings' conflict with Francis was one of principles as well as of personalities. Francis believed that the establishment of a good administration was impossible. He would have restored Clive's system of a dual government, desiring that the English should do nothing but restrict the amount of revenue collected and maintain a strong army. Hastings tried to unify the government under English control, preserving all its traditional forms and changing as little as possible of its ideas, but inspiring it with a new spirit of efficient integrity. He was handicapped, however,

by the ill defined authority of the supreme court, which interfered with the collection of the revenue and with the decisions of tribunals not subject to its jurisdiction. The Regulating Act had further subjected the external policy of Bombay and Madras to the supervision of the governor general and his council but without giving the latter sufficient authority. The result was a series of differences over the conduct of the wars which broke out with the Marathas and with Haidar Ali of Mysore. In 1778 these difficulties were enhanced by the war between France and Great Britain. Hastings had to employ the resources of Bengal to maintain the other presidencies without being able to control their conduct. Under the pressure of these circumstances he resorted to those expedients which formed the basis of the main charges later brought against him. On returning to England in 1785 he was impeached, mainly owing to the intrigues of Philip Francis, but was acquitted after a prolonged trial. He was entrusted with the government of British India under a vicious system, which disappeared immediately after his retirement and which would have broken down completely if it had not been for Hastings' extraordinary tenacity, judgment and resource.

HAUCK, ALBERT (1845-1918), German historian. Hauck was born in Wassertrüdingen. From 1864 to 1866 he studied theology at Erlangen under Hofmann and Thomasius and in 1866-67 theology and history at Berlin, where the personal and scientific influence of Leopold von Ranke settled him in his life work. On the basis of his publication of *Tertullians Leben und Schriften* (Erlangen 1877) he was appointed to the faculty of the University of Erlangen in 1878. In 1889 he went to the University of Leipzig, where he taught ecclesiastical history until his death. In 1881 he began his investigations into the mediaeval German church, which is his particular province as a historian. Although he

died too soon to carry his *Kirchengeschichte Deutschlands* down to the Reformation, the five completed volumes extending to 1437 (vols. i-v, Leipsic 1887-1920; vol. v, pt. ii. ed by H. Boehmer; 3rd-4th ed. 1911-20) constitute a standard work cautious in treatment and laying particular emphasis upon the interweaving of international and national elements in the evolution of the German church. He was co-editor of the second edition (1877-88) and independent editor of the third edition (1896-1913) of Herzog's monumental *Realencyclopädie für protestantische Theologie und Kirche*. Among his other publications are included *Der Kommunismus in christlichem Gewande* (Leipsic 1891), *Die Trennung von Kirche und Staat* (Leipsic 1912; 5th-6th ed. 1919), *Deutschland und England in ihren kirchlichen Beziehungen* (Leipsic 1917), *Die Reformation in ihrer Wirkung auf das Leben* (Leipsic 1918) and a fourth revised edition of H. Schmid's *Lehrbuch der Dogmengeschichte* (4th ed. Nördlingen 1887).

Hauck is the most magistral delineator of German ecclesiastical history. Although as theologian he belonged to the conservative Erlangen tradition, his *Kirchengeschichte* shows that as historian he was, as he always acknowledged himself to be, the pupil of Ranke. Hauck was in fact the most faithful of Ranke's disciples. Remaining in the field of ecclesiastical history, unlike most of the other important members of Ranke's school, he kept alive during the time of Bismarck and his epigoni Ranke's scientific conception of history and Ranke's idea that the investigator must have the point of view of a universal historian. As early as 1877 Hauck wrote: "The history of the past is the teacher of the future. For those who stand in the flux of life nothing is so essential as a calm, unbiased judgment which does not permit itself to be seduced by contemporary party sentiment. History beyond anything else teaches how to make such judgments." He concludes with Ranke: "The history of the world is unaffected by the deliberate decisions and chance deeds of individuals; its course is rather determined by the evolution of spiritual forces or tendencies . . . by which individuals, however mighty, are always swept along." The only great historian of Ranke's school who was also a theologian, he preserved Ranke's world view, which was basically religious, and in a certain sense, by substituting faith in a purposeful God for Ranke's attitude of resignation, he completed it. The *Kirchengeschichte*, however, failed to inaugurate a new epoch of scientific history.

Nor has Hauck's insistence upon facts and their indisputable consequence had adequate repercussions upon the theological conceptions of the conservative theologians with whom he was affiliated, although he has exerted some influence upon their work in the specific sphere of ecclesiastical history.

ERNST BARNIKOL

Consult: Boehmer, H., "Albert Hauck, ein Charakterbild" in *Beiträge zur sächsischen Kirchengeschichte*, vol. xxxiii (1920) 1-78, containing bibliography of Hauck's writings; Bauer, Karl, in *Die Religion in Geschichte und Gegenwart*, vols. i-iv (2nd ed. Tübingen 1927-30) vol. ii, col. 1647; Below, Georg von, *Die deutsche Geschichtschreibung*, Handbuch der mittelalterlichen und neueren Geschichte, pt. i (2nd ed. Munich 1924) p. 75.

HAURIOU, MAURICE (1856-1929), French jurist and sociologist. Hauriou was professor of law at Toulouse from 1883 until his death. The sociological doctrines of his early works are applied in his later, principal works relating to legal philosophy and theory. A traditionalist seeking to base his doctrines on Catholic dogma, he undertook above all else the defense of individualism. The "individualistic order," the primary importance of private enterprise with its corollaries of private property and civil liberty, is for him the immutable natural law, the sole path of progress for any society. The state has no other function than to guarantee and support this natural right and laws contrary to it should be void. In the political order the idea of individualism implies the recognition of and respect for the supremacy and autonomy of the executive, whose staff forms an élite by reason of its ability and the eminent value of its will and who has therefore a right to command. The people, who wish to rule for the sake of ruling but lack ability to do so, and their representative, parliament, should limit their activities to a control of the actions of the executive without hampering his freedom. There is a strict correlation between these doctrines and Hauriou's theoretical concepts. He adheres to the social philosophy of Tarde: social evolution is entirely the work of powerful individualities—men of genius, leaders who transmit their ideas to others. The social environment determines nothing; its role is confined to resistance or consent. The state is bound up with the individualistic regime and is incompatible with a socialist or communist society. Hauriou's name has become associated with a "theory of institution," which would seem to reduce itself to the statement of the importance

in the structure and evolution of society of the permanent organizations which serve the collective interest. In their totality they constitute the individuality of the state.

CHARLES EISENMANN

Important works: *La science sociale traditionnelle* (Paris 1896); *Principes de droit public* (Paris 1910, 2nd ed. 1916); *Précis de droit constitutionnel* (Paris 1923, 2nd ed. 1929).

Consult: Eisenmann, Charles, "Deux théoriciens du droit: Duguit et Hauriou" in *Revue philosophique, de la France et de l'étranger*, vol. cx (1930) 231-79; Platon, Georges, *Pour le droit naturel, à propos du livre de M. Hauriou: les principes du droit public* (Paris 1911). Hauriou has himself summarized his theories in an article, "An Interpretation of the Principles of Public Law" in *Harvard Law Review*, vol. xxxi (1917-18) 813-21.

HÄUSSER, LUDWIG (1818-67), German historian. Häusser was born in Alsace, studied at the universities of Heidelberg and Jena and was influenced chiefly by the enlightened liberalism of F. C. Schlosser. His first important historical works were *Über die deutschen Geschichtsschreiber vom Anfang des Frankenreichs bis auf die Hohenstaufen* (Heidelberg 1839) and *Die Geschichte der rheinischen Pfalz* (2 vols., Heidelberg 1845). Beginning in 1846, however, Häusser combined an absorption in the political problems of his own time with his historical research. He set forth the German national view of the Schleswig-Holstein problem in his *Schleswig-Holstein, Dänemark und Deutschland* (Heidelberg 1846) and in 1847 joined with Gervinus in the founding of the *Deutsche Zeitung* to further the cause of German unification under the leadership of Prussia with the exclusion of Austria. He was a member of the Erfurt parliament in 1850 and of the upper house in Baden in 1848, 1850 and from 1860 to 1865. During the latter period he was especially prominent as an advocate of a liberal church and school policy and as an opponent of both Protestant orthodoxy and Catholic ultramontanism.

As a historian Häusser was less prominent than other leaders of the so-called Prussian school like von Sybel, Droysen and Treitschke. He nevertheless is of special importance in the history of German public opinion because of his role as the south German representative and disseminator of Prussian-German nationalism. His lectures at the University of Heidelberg and his most celebrated work, *Deutsche Geschichte vom Tode Friedrichs des Grossen bis zur Gründung des deutschen Bundes* (4 vols., Berlin 1854-57; 4th ed. 1869), were both very influential in

arousing and spreading German national feeling in the south German states.

HAVEMEYER, HENRY OSBORNE (1847-1907), American capitalist. Havemeyer was born of a family of sugar refiners and at twenty-two became a member of the firm of Havemeyer and Elder. Under his management the business grew to first rank and in 1887 the firm became the nucleus of the Sugar Refineries Company, a common law trust combining seventeen out of the twenty-three refineries in the country. By its incorporation in 1891 as the American Sugar Refining Company it became one of the earliest outright mergers. The company's financial success was phenomenal, even though in order to maintain its supremacy Havemeyer did not hesitate to prosecute aggressive and costly trade wars, which resulted eventually in the absorption or submission of nearly all the "interlopers," as Havemeyer termed the recalcitrant independents.

Havemeyer and the American Sugar Refining Company were in the forefront of the combination movement which swept American industry after 1880. They both aroused intense public hostility and government action. In 1897 Havemeyer refused to answer questions of a United States Senate committee, was arrested for contempt but subsequently acquitted. Before another investigating committee he insisted that the government should not interfere to protect consumers or stockholders—people must be allowed to learn from experience. By his famous assertion, "The tariff is the mother of trusts," he seems to have meant that the existence of a high tariff presents a standing invitation to domestic producers to combine and mulct the consuming public. Havemeyer insisted uncompromisingly on corporate secrecy; he was unwilling to indulge the "idle curiosity" of stockholders concerning the details of the corporation's finances other than the amount of its annual net earnings; the method of their computation being unrevealed, such figures concealed, doubtless for adequate reasons, as much as they disclosed. He proclaimed the most stalwart devotion to the principles of laissez faire individualism while actively promoting monopolistic combination and suppressing competition. In business an autocrat,

in politics a democrat and in both a major general of fortune, Havemeyer neither antedated nor outlived his true generation.

HAYERFIELD, FRANCIS JOHN (1860-1919), English historian. Haverfield was educated at Winchester and at New College, Oxford. In 1888 he was asked by Mommsen to become one of the editors of the *Corpus inscriptionum latinarum*, and his "Additamenta quarta ad corporis vol. vii" (in *Ephemeris epigraphica*, vol. vii, 1890, p. 273-354) established his reputation as an epigraphist. In 1892 he returned to Oxford, having been appointed to a senior studentship at Christ Church, and in 1907 he was elected Camden professor of ancient history at Oxford. In 1911 he became the first president of the Society for the Promotion of Roman Studies, the formation of which had been in large measure due to his initiative. If it was his predecessor in the Camden chair, H. F. Pelham, who first interested Haverfield in Roman history, it was Mommsen's influence and friendship which determined his life work. Haverfield recreated the historical study of Roman Britain by bringing that study into close relation with the history of the Roman Empire as a whole. He never wearied in exposing the errors into which the mere local antiquary so often falls. During his long solitary walking tours he had gained an intimate knowledge of the European provinces of the empire, and that knowledge formed the background of his work on Roman Britain. Through his membership in numerous local archaeological societies, through his first hand acquaintance with all excavations of Romano-British sites, he became the clearing house to which other workers constantly resorted. He was thus able to coordinate results and always endeavored to promote cooperation both national and international. At the time of his death he was planning the publication of a complete collection of Romano-British inscriptions with

illustrations and notes. Although Haverfield wrote few books, his total output in articles and reviews was very large.

HAVLÍČEK, KAREL (Karel Borovský) (1821-56), Czech journalist and nationalist. After his expulsion from a theological seminary Havlíček was for a while a tutor in Moscow but soon returned to Bohemia and took up journalism as editor of a government paper. As a youth he had joined the Czechoslovakian nationalist movement, which for the first time since the crushing war from 1618 to 1648 had been given a program by Josef Jungmann and František Palacký. At the beginning of the Revolution of 1848 he founded the national liberal *Národní noviny* (National news), the first Czech newspaper and until its suppression in 1850 by the reactionary Austrian government the most important Slavic journal. With Palacký he called the Slav Congress of 1848. He also edited a magazine, *Slovan* (the Slav), in 1850-51. From the latter year until 1855 he was interned as a political prisoner in the Tyrol.

Havlíček's chief work was the creation of Czech journalism. In addition he was a political satirist and controversialist of genius, combining a vivid sense of contemporary realities and an earnest desire to educate with an amazing humor and wit expressed in a form characteristic of his people. He was the most popular Czech of the nineteenth century, and the tradition which he set was followed for many years by the entire Czech press. Havlíček's political and social ideas were a synthesis of eighteenth century rationalism and utopian belief in education with the nationalist romanticism, liberalism, utilitarianism and positivism of the nineteenth century. His writings also contain anticipations of later ideas of cooperation, agrarianism and regionalism.

HAWLEY, FREDERICK BARNARD (1843–1929), American merchant and economist. Hawley, who was born of a line of successful lawyers and merchants, graduated from Williams College and became a cotton broker in New York City. He made of political economy a lifelong avocation. Trained in the theories of the classical English school but living in a notable era of American business enterprise, he adopted the deductive method of the former, the point of view of the latter. Economics he sought to limit to the study of those combined activities of human beings in which the motives are definitely personal and the distribution of the purchasing power resulting from joint activity is prearranged by the entrepreneur. In the entrepreneur, who assumes all the responsibility and risk inseparably connected with the only active economic function—that of productively combining the passive factors: land; “opportunity,” i.e. special advantages; labor; and capital—he discerned the pivotal figure in economic life and the chief object of economic analysis. He declared that the reward of the entrepreneur as such—profit, properly so-called—consisted solely of a recompense for risk bearing, a recompense necessarily indeterminate in amount. Rent was the income received by the owners of land or any other form of “opportunity,” including fixed capital goods; interest was the payment for the use of capital, defined as transferable, because as yet unexpended, purchasing power. The accumulation of such capital, Hawley believed, tended constantly to outstrip opportunities for profitable investment, thus precipitating periodical business crises. This danger is increased by public indebtedness, which in the long run makes for greater accumulation and concentration of capital, and may be reduced in agricultural countries by a protective tariff, which widens the field of investment. An original and rigorous thinker, Hawley anticipated much that has since found acceptance in economic theory. Yet, perhaps owing to the narrowness and numerous heterodoxies of his system and to his lack of an academic position, his own direct, or at any rate admitted, influence was slight.

HAXTHAUSEN, AUGUST VON (1792–1866), German historian. Commissioned by the Prussian government Haxthausen spent over ten years making a thorough study of agrarian institutions in Prussia and adjacent provinces. He encountered a number of types of agricultural settlements and elements of community life widely divergent from the common German types and he ascribed their origin to the early Slavic population of these provinces. In 1843 he obtained a subsidy from the Russian government that enabled him to make a six months’ tour of European Russia, during which he studied agricultural institutions and digested a vast amount of material gathered by Russian governmental agencies. The diary of his tour, the third volume of which contained many interesting remarks on the Russian church, nobility and foreign policy, constitutes a significant study of agrarian forms, particularly the Russian village community.

Haxthausen was an early representative of those political and social tendencies which culminated in the policy of Bismarck and in socialism of the chair. Although, despite current opinion to the contrary, the peculiar Russian forms of agrarian communes were known to and their significance properly appreciated by the Slavophiles and even the Decembrists long before Haxthausen’s time, the illumination which he cast on both the conservative and progressive social values involved in them contributed not a little to the development of Russian social thought. Haxthausen was also the theoretical forerunner of later developments in regional cultural geography and rural sociology. His writings clarify general problems of rural culture and civilization which are of much interest today not only in Russia but throughout the western world, wherever the dangers of urbanization are feared.

HAY, JOHN MILTON (1838–1905), American writer, politician and diplomat. Born in Indiana, reared in Illinois and educated in Brown University, he took up law and literature and became one of Lincoln's private secretaries during the Civil War. The years 1865 to 1870 he spent in the American diplomatic service in Paris, Vienna and Madrid. Upon returning to the United States he devoted himself to poetry and journalism. His marriage to Clara Stone, daughter of a wealthy Cleveland banker, increased his influential business and political connections and contributed to that synthesis of literary dilettantism and political and economic conservatism which characterized his later life.

His career as a gentleman of letters was marked by the publication of sundry poems and essays, one important novel and a ten-volume life of Lincoln, of which John G. Nicolay was co-author. These works are less significant from a literary point of view than for the light which they throw upon the social attitudes which Hay developed and which he impressed upon the inner circles of the Republican party. His earlier works were in the New England tradition, but he gained popularity through his *Pike County Ballads* (Boston 1871), inspired by the life and language of the midwest which he had found such a "dreary waste of heartless materialism" after his college days. In his later writings he became the foremost apologist of the new capitalism of the seventies and eighties. His apologetics was motivated less by any consciously felt necessity of justifying the interests and activities of the aristocracy of wealth, of which he had become a part, than by alarm at attacks upon property on the part of the proletarian mob. The strikes and labor riots of 1877 convinced him that the devil had entered into the lower classes. In his work of exorcism he contributed much to those rituals of magic and incantation which later Republicans have used so effectively in dealing with social problems. His first novel, *The Breadwinners* (published anonymously, New York 1884), dramatized the struggle of morality, good government, culture and industrial leadership against the radical demagogism which he

felt was misleading the laboring masses into dangerous acts of violence. In the words of his biographer, William Roscoe Thayer, it was "the first polemic in American fiction in defense of property."

Hay's political philosophy was that of a post-bellum Hamiltonian, filled with admiration for the English ruling class and for British imperialism and convinced that the new proprietors and entrepreneurs of industry and finance possessed an inherent right to rule over the rabble by virtue of their superior intelligence, civic-mindedness and political capacity. But power must be accompanied by that sense of public responsibility without which every aristocracy is lost. The leisure class must devote itself to public affairs and assume political leadership. The gentlemen business magnates of the Republican party must govern the nation so as to protect property and promote prosperity. The masses would profit by a full dinner pail. The heritage which Hay left to later generations of Republican politicians, from McKinley and Roosevelt to Hughes, Hoover and Stimson, was the conviction that the G.O.P. possessed a monopoly of statesmanship and that the country's prosperity depended upon its continuance in office.

The later phases of Hay's public life attest his devotion to these convictions. He became first assistant secretary of state and then ambassador to Great Britain in 1897. He held the office of secretary of state from September 30, 1898, to July 1, 1905, during the critical period in which the United States emerged from nineteenth century isolationism into world politics. In this capacity he served as the suave and cultured escort of American imperial expansion. He supported the decision to retain the Philippines, encouraged the "taking of Panama" and negotiated in vain for the acquisition of the Virgin Islands from Denmark. The Hay-Pauncefote treaty of 1901 permitted the construction of an isthmian canal under the exclusive control of the United States. His most distinctive contribution to American diplomacy was perhaps the "open door" policy in China, formulated to protect American commerce in the Far East. His service as secretary of state thus coincided with the establishment of persisting patterns of American foreign policy in the Caribbean and in the Orient. If his role in their formulation was not a decisive one it was nevertheless one which he fulfilled with dignity and ability. It symbolized moreover the spirit of patriotic power and expanding prosperity which inspired the new rulers of America and

which Hay himself did so much to make an integral part of the traditions of the Republican party.

HAYES, EDWARD CARY (1868-1928), American sociologist. Hayes studied at Bates College, the University of Berlin and the University of Chicago, where he was greatly influenced by Professor A. W. Small. He was professor of sociology at Miami University from 1902 to 1907 and at the University of Illinois from 1907 to his death. Hayes was one of the first to use the phrase the social process ("Sociological Construction Lines" in *American Journal of Sociology*, vol. x, 1905, p. 623-42, 750-65) to designate the proper object of attention of the sociologist. The social process he defined as the sum total of those interwoven activities which are psychic in essence and are manifested in speech and conduct in a fashion impossible to the individual outside of group life. It is to these interindividual activities that the sociologist should direct his study rather than to "the social organism," the group or the person. As the activities which constitute the social process are essentially psychic, there arises a close connection between psychology and sociology. Values which inhere in these interindividual psychic activities need to be explained and the purpose of sociology, accordingly, must be to construct a scientific ethics. To those who maintained that science had nothing to do with values Hayes replied that an evaluation to determine the best policy was no more improper in science than any other evaluation of facts or inference used to arrive at conclusions or to determine scientific laws. While Hayes made much of the social process and of conditioning phenomena in the physical and psychical worlds he was doubtful of the utility of the concept of "social forces." He believed that sociology like other sciences should set about breaking up phenomena into minute details and searching for correlations. In sum, sociology was accord-

ing to Hayes a natural science with an ethical purpose or outcome.

CHARLES A. ELLWOOD

Important works: *Introduction to the Study of Sociology* (New York 1915; rev. ed. by H. P. Hayes with title *Sociology*, 1930); *Sociology and Ethics* (New York 1921); *Recent Developments in the Social Sciences* (Philadelphia 1927).

HAYM, RUDOLF (1821-1901), German philosopher, politician and historian. Haym was born in Silesia and studied at the University of Halle. Here he joined the group of young Hegelians, led by Arnold Ruge, who endeavored to develop the philosophy of Hegel along the lines of political progress. Because of his liberal tendencies he was not admitted as an academic teacher. In 1848 he became a member of the Frankfort National Assembly; and his account of the proceedings contained in *Die deutsche Nationalversammlung* (3 pts., Berlin 1848-50), written from the point of view of the moderate liberal party of the Right Center, constitutes one of the most vivid sources for the history of the assembly. In 1848 he edited the old-liberal *Konstitutionelle Zeitung*, but during the period of reaction in Prussia between 1850 and 1858 he withdrew from politics and devoted himself to the study of the history of literature and philosophy. *Wilhelm von Humboldt* (Berlin 1856) and *Hegel und seine Zeit* (Berlin 1857, 2nd ed. Leipsic 1927) are the most important results of this period. His book on Hegel is of special importance because it marked the transition in Germany from philosophic and speculative to historico-empirical research. In 1858 with the beginning of the liberal "new era" in Prussia he became editor of the *Preussische Jahrbücher*, the foremost literary and political organ of the moderate liberals. He continued his studies in German history, achieving great renown by his *Die romantische Schule* (Berlin 1870; 5th ed. by Oscar Walzel, Berlin 1928) and *Herder, nach seinem Leben und seinen Werken* (2 vols., Berlin 1877-85).

OTTO WESTPHAL

Consult: Haym, Rudolf, *Aus meinem Leben* (Berlin 1902); *Ausgewählter Briefwechsel Rudolf Hayms*, ed. by Hans Rosenberg (Stuttgart 1930); Westphal, Otto, *Welt- und Staatsauffassung des deutschen Liberalismus* (Munich 1919).

HAYWOOD, WILLIAM DUDLEY (1869-1928), American labor leader. Born in Salt Lake City. Haywood after a few years of school be-

came a miner. The frontier bred in him, as in the mass of western unskilled workers whose leader he became, a predilection for direct action; the mine owners' open, ruthless use of the state power against the heavily exploited miners stimulated a militant class consciousness. Impressed by the Chicago anarchists' trial, Coxe's army and the American Railway Union strike, he supplemented these living lessons in class struggle by reading socialist literature and absorbing traditions of radical unionism current among his fellow workers. In 1896 he joined the Western Federation of Miners, one of the first American industrial unions, and in 1901 the Socialist party. His bravery and a flair for agitation, organization and strike strategy brought him to the fore in both organizations. In 1905 he presided over the convention which founded the Industrial Workers of the World, whose outstanding leader he became. Although he distrusted the parliamentarism of official Socialists he never became a whole hearted opponent of all forms of political action. Agreeing with De Leon that the workers must seize power, he argued against De Leon's program of "indoctrination" that the workers must learn class solidarity through daily struggles on immediate issues. Above all he persistently attacked class collaborationist craft unionism, expounding the theory of revolutionary industrial unionism and demonstrating its power in his leadership of such militant strikes as those at Cripple Creek (1904), Lawrence (1912) and Paterson (1913). Although the doctrines of the I. W. W. bear some resemblance to French syndicalism, the latter influenced Haywood little; his views were forged in the heat of struggles of unskilled, unorganized, Negro and immigrant workers, all those who did not share the privileges of the exclusive craft unions.

Haywood was frequently prosecuted for his activities. In 1906 he and two colleagues were acquitted in a murder trial based on perjured testimony after he and his counsel, Clarence Darrow, had converted the court into a seminar on the class struggle and mass demonstrations of workers had protested against the trial. As a consequence of the I. W. W.'s antiwar program Haywood, indicted in 1918 with 112 fellow workers, was tried and sentenced to twenty years' imprisonment. While on bail awaiting a new trial Haywood accepted the invitation of the Communist International to go to Moscow, where he remained. He joined the Communist party and urged the I. W. W. to merge with it.

Along with De Leon and Debs, Haywood

stands out in America of the period before the formation of the Communist party by virtue of his emphasis on class struggle and his opposition to the exclusiveness and bureaucratism of the American Federation of Labor; the theory and practise of industrial unionism which he championed have become in modified form an essential part of the American Communist program and constitute one of the few American contributions to the international labor movement.

HERBERT SOLOW

Consult: Bill Haywood's Book (New York 1929); Brissenden, Paul F., *The I. W. W., a Study of American Syndicalism* (2nd ed. New York 1920).

HAZLITT, WILLIAM (1778-1830), English journalist, critic and essayist. Brought up under Dissenting influences, he associated as a young man with the English Jacobins. After early studies in Hume, Hartley and the French *philosophes* he turned to Rousseau and, although hardly a disciple, he illustrates the destructive effect of Rousseau's influence on the prevailing sensational psychology. His *Essay on the Principles of Human Action* (ed. by his son W. Hazlitt, London 1835) is devoted to a criticism of this theory of the complete passivity of the mind. From this he passed on to an often repeated attack on the psychological inadequacy of utilitarianism and to a criticism of the economists. *A Reply to the Essay on Population* (London 1807), although intemperate and sometimes unfair, is a serious contribution to the Malthusian controversy. It points out Malthus' debt to Robert Wallace and effectively demonstrates the weaknesses in his argument, especially in the geometrical and arithmetical theories and in the view that any improvement in the conditions of life of the poor necessarily increases the tendency to excessive population. Hazlitt turned to regular journalism in 1812. He wrote extensively against the Tories and against legitimism in France—it was as the enemy of divine right that Napoleon was Hazlitt's idol—but he was almost equally hostile to the Reformers and the Whigs. Many of these political articles were collected in *Political Essays* (London 1819).

His political prejudices permeate his writings, but his enduring fame is as a literary critic and brilliant stylist. His ideas in political and social thought were almost entirely negative. A believer in individual natural rights, he held that the state has merely police functions. *Vox populi* is *vox dei* so long as it is not perverted by the corrupt influence of government. Apart from a

strong vein of economic equalitarianism his positive political views are those of a typical nineteenth century democrat.

HEADLAM, STEWART DUCKWORTH (1847-1924), English reformer. Bred in the evangelical school of the Church of England, Headlam found in the doctrine of F. D. Maurice an escape from its teaching on eternal punishment. He accepted Maurice's theology of the incarnation as interpreting and sanctifying man's bodily and social as well as his spiritual life. After ordination he was attracted by the mass as practised in ritualist churches. He emphasized the social implications of sacramentalism and joined the Anglo-Catholic movement. From 1884 to 1895 he edited the *Church Reformer*. By nature a fighter, he frequently came into conflict with authority and convention: his championship of Bradlaugh and the Secularists brought him into conflict with his bishop; his Church and Stage Guild, with its defense of the ballet, cost him not merely his curacy but for ten years his license to officiate; his Guild of St. Matthew, avowedly socialist, was also suspect. Headlam was in fact a democrat and single taxer rather than a collectivist. For the last thirty years or so of his life his primary interest was in educational administration as a member of the London School Board and its successor, the London County Council. Headlam devised no original social theories but is significant as a link between the Christian Socialism of Maurice and Kingsley and later movements such as the Christian Social Union and the Church Socialist League.

HEALING. See MEDICINE.

HEALTH ADMINISTRATION. See PUBLIC HEALTH.

HEALTH CENTERS. With the passing of the authoritarian or compulsory era of public health administration and its replacement by public information and personal participation in matters of preventive medicine as the driving forces toward a greater security, better quality and longer average length of life, a new symbol of community service in this field of social endeavor evolved naturally and has grown increasingly in favor in modern nations. This new unit in city neighborhoods and in rural county seats or crossroads, the health center, is a fitting physical and functional expression of an ideal based upon the recognition of the need of continuous centrally coordinated health work for local population groups. The health center may be likened to the chain store, where the resources of the earlier general department store are brought conveniently close to many small neighborhoods or communities. It involves the coordination and joint housing of the interrelated health and social welfare agencies and services for a district, neighborhood or community. Health centers may be entirely provided by the municipality or some other unit of government, especially where, as in Europe, other social welfare services are part of a program of public welfare.

The term health center was probably first applied in the United States to the coordinate efforts of a group of private welfare and health agencies in Pittsburgh to combat tuberculosis and in Philadelphia to secure the health of childhood, both in 1912. In Milwaukee an experimental district health center was established about the same time to save infant life. Two years later the Department of Health of the city of New York established a successful district health center. By 1917 there were about a dozen more or less complete health centers in the large cities, and by the end of 1919 seventy-two such centers in forty-nine communities predominantly urban in character.

In an effort to carry over into peace time some of the benefits of the American Red Cross a program of health center development through local chapters was encouraged. The name health center was used rather indiscriminately under these auspices to describe anything from a first aid station, a rural nurse's district office, a prenatal or baby conference or a tuberculosis or tonsil clinic to an elaborate and well conceived establishment where all manner of official and volunteer medical nursing, health and social activities appropriate for a city community were coordinated. Approximately 385 Red Cross health cen-

ters of a great variety were in operation in 1920. In 1927 it was estimated that there were 1000 separate establishments in the United States calling themselves health centers and serving in some measure to correlate and coordinate neighborhood health work. In many of the 500 counties in the United States where there is a full time health officer and at least an approximation to a modern program of health protection, the county health office is to all intents and purposes a health center providing for all services of official and voluntary agencies under one roof and serving a circumscribed area and the population of a single political unit.

In the United States the most usual form of the health center is the branch office of a health department, which provides space for volunteer agencies contributing to public health, such as visiting nurse and family welfare societies. It therefore serves to coordinate all those functions which require the home visiting of doctor, nurse or sanitary inspector or those which require advice, counsel, warning or specific preventive and diagnostic services, particularly in the care of maternity, infancy, childhood, the control of communicable diseases and the dissemination of knowledge upon hazards of health and resources for its development and protection. Such an arrangement usually takes the form of mutual responsibility in which the local health officer is left in undisputed control of the building and the public employees and the unofficial agencies are accorded independence in their cooperative efforts and personnel. In some instances a health center may be established without the participation of the local health department, by two or more volunteer agencies cooperating for convenience of housing or for economy of records or personnel; but such establishments do not meet the needs or the ideals of adequate public health service, are usually short lived and are incorrectly designated as health centers.

A specialized form is the industrial health center, which is usually the outgrowth of an industrial medical service expanded to deal with the families of employees and to provide preventive as well as curative services to all who are included under the scheme. Still another form is that of the Union Health Center of New York, a combination of educational, therapeutic and preventive medical services growing out of the activities of the Joint Board of Sanitary Control of the needle trades unions in New York City.

A health center is not, however, a clinic or dis-

pensary, and unless for a special purpose—for instance, to meet temporarily an inadequacy in the community facilities for organized care of the sick—it should not offer therapeutic services to ambulatory patients other than those suspected or known to be suffering from a communicable disease. It may, however, as in Alameda, California, be operated with certain definite advantages as a part of a public hospital and outpatient dispensary.

English and German cities, with their sound traditions of administrative health practise, have developed district, borough or regional health offices complete in every respect for field and preventive services, all under government direction. London and Liverpool offer admirable examples of highly developed district health centers, and there are no centers more thorough in conception, equipment and function than the several *Gesundheitshäuser* operated for each 200,000 to 400,000 of the population of Berlin. They have furnished a sound basis for the various services in the fields of mental hygiene, infant and maternity welfare and the like. In Czechoslovakia and Yugoslavia are to be found reasonably self-sufficient depots or stations through which the national government brings its medical and educational health services to bear appropriately upon the needs of the rural community.

In at least two instances American initiative and capital have brought the health center to regions somewhat backward in health services. A Rockefeller Foundation grant established in 1925 has helped in the upbuilding of some 140 health centers in various cities of Poland; these include clinical and dispensary service. In Jerusalem the American organization of Zionist women, Hadassah, has established a health center which supervises a network of twenty health and welfare bureaus and administers school hygiene.

One of the best examples in the United States of the health center which provides all or most of the functions of a complete community health service is that of Boston. In 1916 there was set up a neighborhood health center which has gradually extended the principle through six well planned and consistently operated district buildings, each serving a population of 75,000 or less. This has been made possible largely through a legacy to the city of Boston, the income of which has been devoted to the construction of the buildings. Other such centers are those of Alameda county and Los Angeles county in California operated by the county in cooperation

with many private agencies, that of San Joaquin county supported by the taxpayers, the East Harlem Health Center in New York City operated by public and volunteer health and social agencies under the auspices of the local chapter of the American Red Cross, and the Bellevue-Yorkville Health Demonstration in New York City operated in a similar manner but generously aided in building and personnel through philanthropic funds.

A health center which maintains a family and house file provides the basic data for invaluable social, demographic, medical and sanitary statistics and research. No municipality in the United States has in operation a complete system of health centers such as are found in the English and German cities. Boston most nearly approaches this ideal, and in 1930 the city of New York made plans for more than thirty centers to be related to the central city and borough offices of the health department.

Government should take primary responsibility for all public health activities. It is increasingly recognizing this duty by the appointment of a more trustworthy type of health officer, by better security in office and by less inadequate appropriations. Where for social, political or financial reasons the performance of the local government, sometimes aided by state grants or subsidies and by federal assistance (as through the rural health program of the United States Public Health Service), lags behind the conscious needs of the community, volunteer health activities and philanthropic aid can usually be found to develop supplementary services. Whether health work is wholly tax supported, as is rarely the case in the United States, or is largely provided by volunteer health agencies, as is common in both cities and rural areas, the administrative device of the health center offers the best prospect of satisfying a community or neighborhood social consciousness of health needs with least waste of time, money and energy and with the greatest tangible results through education and example. The health center is a local clearing house for collecting and distributing health information and services to all the people of a community.

HEALTH EDUCATION. Although such preventive measures as the Mosaic sanitary code and the Venetian quarantine laws enacted in 1383 antedate Pasteurian medicine, the modern movement in personal and community health followed as a consequence of the development of the science of preventive medicine in the nineteenth century. At about the same time there developed also a new concern with the problems of human welfare in which disease was no longer viewed as an instrument of divine wrath but rather as a process inherent in life, product in part of circumstance but by no means inevitable or unamenable to social control. In contrast, moreover, to the health education efforts put forward sporadically by isolated individuals in the correction of a special situation prior to the last half of the nineteenth century, the modern health education movement is social. A pointed illustration of this difference may be seen in the individualistic efforts of Philippe Pinel in 1792 to educate the public on the necessity for humane treatment of the insane and those of the National Committee of Mental Hygiene, a body supported by voluntary contribution and carrying on organized and continual propaganda in that branch of preventive medicine. The movement for health education waited, moreover, on

the establishment of sanitary or health boards and the enactment of sanitary codes, which in the United States took place about 1869; by 1873 there were in addition to the state boards over one hundred city boards of health.

In the last quarter of the nineteenth century there also developed the realization, based on the knowledge that most infectious diseases are preventable or controllable, that education in regard to the necessity for health protection is as essential as legislation. This philosophy was adhered to in the face of many difficulties, including the attitude of the medical profession; for although in the vanguard of preventive medicine are to be found the leading physicians of the time, the profession as a whole has lagged behind.

Prior to the twentieth century, health education activities were carried on by state and local boards of health. The most outstanding was the New York City Department of Health, which in 1874 distributed leaflets on infant care and diphtheria, in the late eighties printed the first bulletin on tuberculosis by Dr. Herman M. Biggs and in 1897 distributed 57,000 circulars each printed in four languages on the care of babies and other subjects. By this time the germ theory was fairly well established and had produced enough practical results in the control of diseases to render the public mind more receptive to health education. Moreover, the body of facts in preventive medicine had become sufficiently comprehensive and well organized to give rise to the point of view later epitomized in the dictum of Dr. Biggs that "public health is purchasable; within natural limitations a community can determine its own death rate." This period witnessed too the development of large voluntary associations whose primary objective was the education of the public in matters of personal and communal health. The efforts of the voluntary organizations soon overshadowed those of the official bodies, and this condition with but few though signal exceptions prevails today.

A pioneer among these organizations was the National Tuberculosis Association, organized in 1904, which used health education as its principal weapon in combating tuberculosis. It was the first nation wide voluntary body created to fight a specific disease. As it developed, its state and local organizations served as channels through which to disseminate health information gathered and organized by the central body, which enlisted the aid of the leading physicians of the

country. When the National Tuberculosis Association was organized, there existed only a few sanatoria, some of these mere shacks. There were few if any tuberculosis nurses, open air schools or preventoria. Within twenty years the public's fatalistic attitude toward tuberculosis was changed. Approximately 700 institutions, with a bed capacity of over 70,000, came into being, thousands of nurses were trained in the care of the tuberculous, dispensaries were opened, fresh air classes were created and preventoria were established.

In the achievement of these results the education of the public played a prominent and effective role. As the demand for trained workers increased, the National Tuberculosis Association established training courses, sending the more experienced staff into the field. Moreover, in the course of the association's growth it made pioneering and enduring contributions to the content and technique of health education.

During the earlier periods the most widely used health education instruments employed were leaflets, health talks, lantern slide illustrations, hand painted placards and exhibits; newspaper propaganda was also effectively used. The exhibits were often elaborate affairs of graphic gruesomeness, commonly shown at fairs and in the larger cities in vacant stores. Many of the health talks were delivered by non-medically trained persons, and practically all of the exhibits were created and manned by lay individuals. The antituberculosis movement, however, had the benefit of the best medical advice available, and its educational activities were as sound as the prevailing medical knowledge.

The American Red Cross also played a significant role in the early development of health education. Its scope of educational activities was of necessity wider than tuberculosis, and much of its work consisted in rendering financial help to the tuberculosis group. Other pioneer voluntary organizations formed during this period were the National Committee for Mental Hygiene, founded in 1909; the American Social Hygiene Association, merging the American Vigilance Association and the American Federation for Sex Hygiene, incorporated in 1914; the American Society for the Control of Cancer, organized in 1913; the National Society for the Prevention of Blindness and the Association for Prevention and Relief of Heart Diseases, both founded in 1915. Some of these organizations, notably the social hygiene and mental hygiene groups, by virtue of the special nature of their

subject had to devise new educational means and procedures.

Governmental national, state and local health bodies intensified and extended their educational activities. In 1911 and 1912 respectively the Chicago and the New York City departments of health began to publish weekly bulletins. The former were widely distributed, especially in schools and churches. The New York City bulletin was and still is primarily for the education of physicians in matters pertaining to public health and preventive medicine.

In 1908 the Division of Child Hygiene, a large part of whose activities was health education, was organized in New York City. The first bureau for public health education was organized in 1914 in the New York City Department of Health. During the same year a similar bureau was created in the New York State Department of Health.

In 1929, 36 state and 52 city health departments issued special bulletins, usually monthly, on health topics; several cities have full time directors of public health instruction in addition to the persons in charge of school health programs. School health education itself began in 1894 when the city of Boston inaugurated medical inspection. At present school health programs include, besides health education proper, physical education and health instruction. Practically all of the states make the teaching of hygiene and of physiology compulsory, 2 states have compulsory education in the control of tuberculosis and of communicable diseases, 26 states make physical education compulsory and so on.

Prior to the World War health education was "spotted" in its geographic and general development, but it succeeded in forging for itself a basic philosophy and a technique. A common interchange of experiences was made possible through the various conferences held annually, especially those of the Health Education section of the American Public Health Association, the Social Work Publicity Council and the tuberculosis societies, and by means of a number of publications, bulletins and journals devoted wholly or in part to health education. Especially significant was the advance in school health education.

Among the pre-war episodes which lent impetus to the development of the movement was the White House Conference on Child Health called by President Roosevelt in 1909 which served to secure the concerted attention of phy-

sician, social worker and educator on the promotion of child health. Of equal importance was the meeting of the International Congress on Tuberculosis held in Washington in 1908. Although this was the sixth convention of the group originally formed in 1898, it represented in fact the first truly international gathering.

The momentum of the health education movement was greatly accelerated by events of the World War, by the health problems created by intensification in the industrial pace, but also by the social consciousness which characterized this period. In addition the draft examinations revealed the health status of the country's young male adult population in detail and on a scale never before achieved. Wartime economic prosperity made available larger sums of money to the health organizations, enabling them to work on a larger scale and along newer channels.

During this period the greatest progress in health education was in the industrial field and in the field of child health, although all branches gained as well. The largest task undertaken was in connection with the military forces of the United States, both army and navy, under the direction of the Commission on Training Camp Activities, which called in as aids advertising specialists who made effective the commission's educational work. Although great stress was placed upon the control of the venereal diseases, the total emphasis was placed upon keeping physically fit. Health came to be considered a patriotic duty. The civil population became interested in first aid, home nursing and kindred health topics.

It was during this period that the National Tuberculosis Association organized in 1916 its pioneer child health education service, the Modern Health Crusade, enrolling millions of children in a sustained course of training and practise of good health habits. In 1918 the United States Public Health Service created a new division of health education. The New York City Department of Health commenced in 1916 the publication of a bulletin, *School Health News*, which was distributed to every school teacher. Neighborhood organizations, such as the Community Councils of New York and the Social Units of Cincinnati, came into being in the large cities, and although the scope of their interests was wide, health was their dominating concern.

The techniques in health education were multiplied and improved during this period. The motion picture as an educational instrument,

visual instruction as a whole, including the picture poster, which played so prominent a part in war propaganda, and publicity, in the narrower sense of stressing or creating news value in an item essentially educational or propagandistic, were substantially developed—first in connection with the health education work in the army and navy and later in the community.

Health education, which had a conglomerate content during the previous years, now became differentiated from its apparent parallels, propaganda and publicity. Although at times it took on the character of propaganda in that it became a promotional activity in favor of some particular type of health service, such as smallpox vaccination, typhoid prevention or the extermination of hookworm, it concerned itself chiefly with the dissemination of the established facts of disease prevention, health promotion and life extension. Incidental to its growth were segmentation and specialization. Its two most distinctive divisions became school health education and general health education. The first of these centered about health education of the school child and carried with it numerous and complicated problems of content, textual material, pedagogic methods and the like. The general health education phase, which admittedly has not been as highly developed as school health education, raised a distinctive set of problems centered about content, techniques of publication and presentation, motivation and mass psychology.

At this time the health education movement became somewhat critical of itself and subjected a number of its activities to analysis and evaluation. One outstanding example of this was a questionnaire dealing with venereal disease facts, addressed to soldiers, the replies to which were then subjected to analysis by psychologists. Through this questionnaire it was possible to determine in a measure the effects of certain motion pictures and of other health education activities. It was observed by a contemporary that "these studies probably helped to 'deflate' health education and to give it direction."

The movement also became more integrated. While a large number of new health groups came into being during the war decade, the older ones coordinated their respective endeavors. Resources were pooled, and community health education programs were formulated with some effort to cover the major health items in a balanced manner. New York City was a pioneer in this direction. Largely through the initiative of the local chapter of the American Red Cross

and in cooperation with the New York Tuberculosis Association a comprehensive and coordinating Health Education Council, with a Health Speakers' Service representing the various agencies of the city, was created. Other cities, notably St. Louis, Detroit, Cleveland, Cincinnati and Kansas City, followed suit and created similar centralized organizations.

Although after the war a number of the activities fell into desuetude, many of the war gains in health education were retained, especially the developments in child health education and less so in the industrial field. The former in fact received great impetus in the post-war period partly as a result of the war draft examinations and from subsequent studies on prevailing child health. A National Child Health Council was formed in 1920; two years later the American Child Health Association came into existence.

The greatest gain made in recent years has been in the acquisition of larger objectives. In addition to the prevention and the minimization of the damages wrought by disease, health education now has the aim of promoting the individual's physical and mental well-being to the maximum.

An illustration of this is the health examination originally sponsored by only a small group and applied by insurance companies to certain of their policyholders. Since 1922 the periodic health examination has been promoted by the American Medical Association and very intensely by many of its state and local county societies.

Health education has made considerable progress in the medical profession itself. At the outset physicians schooled in pathologic medicine little appreciated the value of preventive medicine and were not sympathetic to the encroachment of lay or even official bodies. In the last decade, however, preventive medicine has become more and more a part of office practice, the greatest progress in this direction having been made in the specialties of pediatrics and obstetrics. The American Medical Association has actively entered the field of health education through the publication of *Hygeia*, a health magazine for the laity. Numerous county medical societies throughout the country have standing health education committees. A number have speakers' bureaus to supply medical speakers for lay audiences, and some even publish health columns in their local press. A recent and significant innovation is the purchase by a number of local official medical organizations of

advertising space in the daily press for the publication of health items.

Commercial organizations have also entered the health education field. Life insurance companies were among the earliest to promote health education; the Metropolitan Life Insurance Company became an active participator in 1909. In recent years the dairy, cereal, bread, fruit and vegetable, dentrifice, children's wear and other industries have included health items as part of their advertising technique. Their activities are not an unmixed blessing, since their material exaggerates the significance of the health facts in order to promote their products. However, they bring into the field of health education salutary examples of advertising skill. Philanthropic foundations have contributed much to the development of health education directly through demonstrations, such as have been made by the Milbank Memorial Fund, or indirectly by money grants to operating health organizations.

Health education is attracting more medically trained individuals with the promise of interesting and productive careers. It is an important item in the curricula of teachers' training schools, and a number of the universities, including Columbia, New York, Yale, Massachusetts Institute of Technology, California and Michigan, offer special courses in health education. On the other hand, it is receiving but scant recognition in the curricula of medical schools and in the training schools for health officers. Certain fields of health education, those in mental hygiene for example, are still to be developed. Techniques such as the use of the radio await adequate means and the drive of interested groups to prove their full worth.

Health education in Europe differs fundamentally from that in the United States. The voluntary associations and organizations for the promotion of health education do not have their counterpart in Europe, nor do the official health departments engage in this activity to the same extent as in the United States. A good deal of education in health is promoted through independent and uncoordinated agencies. The sickness insurance funds, fraternal organizations, unions, youth movements, athletic and sport clubs, schools and kindred groups teach health in one form or another. Certain propaganda groups agitate on various phases of health, such as temperance, venereal diseases and more recently tuberculosis. However, except in Russia these various activities are not coordinated, and

one can hardly speak of a movement comparable to that of the United States.

On the other hand, certain instruments and techniques of education have been more highly developed and more effectively applied to the promotion of disease prevention and health in Europe than in the United States. Notable among these are the use of the poster, as a result of the high development of poster art in Europe, and the hygiene museum, perhaps best exemplified by the Hygiene Museum in Dresden. Although Europe is behind the United States in the exploitation of motion pictures and of the radio for health education, its newspapers carry more items on health. Leading physicians write freely for the press, which is not squeamish about health matters. This is especially true in Germany and Austria, where excellent health education work is being done in mental hygiene and in baby welfare. Although there are many well written and authoritative works on health, the free distribution of literature practised in the United States is practically unknown.

Russian health educational work is unique. Before the Bolshevik regime health education in the *gymnasia* and in the community was promoted by isolated humanist or reform groups and was very slight indeed. At the present time health education has been made a part of proletarian culture and is conducted under the supervision of the Commissariat of Health and the Commissariat of Education with the cooperation of various official and voluntary, although government promoted, organizations, such as the Department for the Protection of Maternity and Infancy and the Society for Combating Alcoholism. Trade unions are also enrolled in promoting industrial hygiene and health education. These are promoted through nurseries, schools, unions, clubs and mothers' organizations. The press, the radio, poster exhibitions, lectures, lantern slides and motion pictures, theatrical performances on health topics, traveling exhibitions to remote sections, are all utilized. There are "health corners" in cities and villages in so-called reading rooms where books, pictures and pamphlets dealing with the conservation of health are available.

The Russian plan is probably the most completely integrated system of health education in the world, despite the greater advance in other countries in the field of preventive medicine. It results from the realization by Russia of the full value of its man power and the necessity for public provision for education in health as

an inevitable supplement to the broader and more sweeping industrial plan for the raising of the living and working conditions of the masses.

HEALTH INSURANCE. Since the development of an artisan class there have been many attempts to meet the common risks of life by mutual action. The mediaeval craft guilds and the later trade unions provided for definite contributions to meet certain emergencies. Friendly societies were formed, usually with a more heterogeneous membership, for the primary purpose of providing sickness and death benefits. Occasionally an employer imbued with charitable sentiments or desirous of a contented, efficient and healthy staff would institute an establishment fund to provide certain pensions or other benefits. But all these early voluntary attempts at providing insurance protection were restricted in scope. They were confined in the main to the highest paid workmen in the best organized trades. Moreover lack of actuarial knowledge and the inadequate reserves made all schemes precarious. While the doctrine of laissez faire prevailed, the state remained indifferent; and it was only after the evils of the industrial revolution had become evident, when the assumed economic liberty of the wage earning class was seen to be a sham and experience with factory legislation had demonstrated the possibility and the technique of government usefulness, that the state adopted measures to stimulate the development of national social insurance. This represented an interesting legal evolution. There had been times when association for mutual aid met with government disfavor, when guilds were suppressed and trade unions and friendly societies condemned as conspiracies. Laissez faire came to mean that mutual aid and welfare schemes were subject to the ordinary rules of law. But with the new change in viewpoint employers in exceptionally hazardous industries, such as mining and marine, were required to make special provisions for industrial accidents. Existing mutual aid schemes were given a more favorable status and then granted definite subsidies in return for government supervision.

It was Bismarck's great achievement that he took advantage of the expanding mutual aid movement, led the humanitarian sentiment of the 1870's and 1880's and made acceptable the thesis that compulsion was inevitable, that state control of social insurance measures was indispensable and that state subsidies were desirable if the great evils in the life of the workman—uncertainty, fear and avoidable poverty—were to be dealt with effectively. Bismarck made it clear that his thoroughgoing paternalism removed the legitimate causes of socialism. He had no sym-

pathy with the ideas of Fourier, who at the beginning of the century had advocated "guarantism" as a necessary stage in the development of socialism. And because it was his jealousy of the trade union movement that led Bismarck to sponsor social insurance, the workers became suspicious of it. The German compulsory health insurance law of 1883 was followed by that of Austria in 1888 and that of Hungary in 1891. During the next decade no such laws were passed, but the growing consciousness of the importance of good health to the individual and to the nation and the knowledge that health could be bought impelled the workers through their trade organizations and their political parties to demand a steady improvement of public health services and of health insurance facilities.

Luxemburg established compulsory health insurance in 1901, Norway in 1909, Serbia in 1910, Great Britain in 1911, Russia in 1911, Rumania in 1912 and the Netherlands in 1913. Between 1914 and 1916 five Swiss cantons took advantage of the permissive federal act of 1911 and passed compulsory measures. Since the World War the secession states have perfected the schemes they inherited. Soviet Russia reintroduced health insurance in 1923; compulsory health insurance schemes were established in Bulgaria in 1918, Portugal in 1919 and Greece in 1922. The comprehensive French insurance law of 1928 in spite of considerable opposition became operative in 1930. In industrial countries outside Europe the movement is well under way. Japan in 1922 and Chile in 1924 adopted compulsory schemes; Brazil has a special arrangement applying to transport workers; Cuba also has a limited scheme; and in Canada and other British dominions public opinion is fast moving toward the adoption of similar measures. Unfortunately the economic depression which began in 1929, with its concomitants of unemployment and lower wages, has reduced the resources of existing institutions and led to the postponement of projected schemes or extensions in Belgium, Austria and other countries.

Prior to this retrenchment the record had been one of steady expansion of the functions of health insurance. Voluntary systems have been absorbed by legislation into compulsory schemes. The circle of insured persons has been enlarged to include commercial employees, salaried employees, professional workers and the smaller merchant class as well as agricultural workers and domestic servants. Benefits are provided increasingly not merely to those insured but also

to those dependent upon them. Cash benefits have been raised. Preventive possibilities have been stressed and the functions of medical benefit and specialized treatment have grown steadily in importance. Hospital care is provided if possible and dental benefits have been introduced where finances permitted. The International Labour Office has drawn up a series of Conventions and Recommendations concerning sickness insurance, the employment of women before and after childbirth, workmen's compensation and industrial disease which although not yet generally ratified by the larger industrial countries, with the exception of Germany, have none the less exerted considerable influence in the direction of higher standards of benefit. It has also cooperated with international associations of insurance institutions in building up a body of insurance knowledge.

Health insurance has grown in scope because it provides an efficient framework for dealing with sickness and incapacity, whatever their origin. Maternity benefits, including medical attention and sometimes a dowry, are now generally provided for. Eleven countries have ratified the convention guaranteeing mothers twelve weeks' benefit and reinstatement in the job. In Great Britain the reserves have been too low to allow of such liberality. All national sickness insurance schemes with the exception of that of Great Britain pay a benefit to cover the funeral expenses of an insured person, and many include dependents as well. When the proposal was made to include this allowance in the original British scheme, the industrial insurance companies were so strongly entrenched that they could not be dislodged, although their administrative expenses as well as the lapse rate are notoriously high. Certain schemes provide not only for short periods of illness but for prolonged ill health and invalidity as well as for premature death. They may further provide for a system of special benefits in case of tuberculosis and cancer. The trend moreover is toward coordination and unification of the various branches of social insurance. To cite an instance: the Austrian insurance law for salaried employees, effective in 1927, unified the administration of health insurance, workmen's compensation and invalidity, old age and survivors' pensions and included unemployment insurance to the extent of collecting contributions. There is a growing feeling that anomalies in the organization of workmen's compensation, in particular the handling of industrial diseases, would be obviated by integra-

tion in one comprehensive system of health insurance.

The classes of the population receiving insurance protection vary from country to country as do systems of administrative organization. In England industrial workers, agricultural workers and certain types of clerical and salaried employees earning under £250 a year all participate in one scheme. In Austria, following the successful coordination of the salaried employee's funds in 1926, a union for industrial workers' funds and one for those of agricultural workers and landowners have also been formed. Almost one fifth of the German workers are insured through establishment funds. In France a separate scheme has been established for three million persons engaged in agriculture. In Italy there are separate corporative systems for industry, for agriculture and for commercial employees as well as a national compulsory tuberculosis insurance fund. A demand for the extension of social insurance to non-manual workers excluded from the scope of the existing British legislation by the operation of the maximum salary limit has been presented by forty organizations of professional workers.

In the early German scheme as well as in the latest French scheme the attempt was made to associate the preexisting institutions with the new funds which were found to be necessary. The problem is typified by the British system. Here the existing friendly societies and trade unions were recognized as "approved societies" to collect and administer cash contributions and benefits. Additional institutions, however, were necessary for those about to become insured. Certain companies and non-democratic friendly societies were therefore also "approved." But a problem is created when private associations not effectively controlled by their members are authorized to fulfil a public duty. The alternative most frequently adopted is that of the organization of the newly insured population on a territorial basis. This basis has been adopted in Great Britain for the insurance committees which administer all medical benefits and control deposit contributions. The introduction of compulsory schemes of insurance has not as a rule resulted in existing institutions becoming the leading administrators. The trade unions, friendly societies or establishment funds have their special functions and are oriented in a given direction. They are not willing to modify their organization or change their policy in order to attract insurance funds. Although most of the

newly insured population is absorbed by the institutions specially formed for these unorganized masses, the influence of the older societies nevertheless makes itself felt within the new system since these societies can speak on behalf of their members and represent their interests as against employers, the government or the medical profession with greater authority than the newer bodies. But the recognition of existing societies and the creation of new ones result in the multiplication of institutions, the complication of administrative and bookkeeping operations and the necessity of equalization funds and other measures for removing anomalies. They render supervision more delicate and thus increase administrative expense; hence the constant cry for simplification, unification and coordination. But these are difficult to achieve when the older bodies wish to maintain their identity, and even the new bodies claim that they can do better for their members than bureaucrats. As a result the trend in central Europe is toward greater democratization and representation of the insured on the boards of insurance institutes.

The device of contributions by the three parties to the wages contract—employers, workers and the state—has proved convenient in Great Britain, Germany and certain other countries. Large sums can easily be raised by this means without any undue burden on any class in the community. It can be justified on the grounds that the worker is the beneficiary, that the employers should contribute toward what ought to be in part a burden on industry and that the state buys its right of control and subsidizes those sections least able to bear the costs. Contributions are as a rule collected by the card and stamp method, which is easy and cheap to administer. Certain schemes, notably that of Great Britain, take a flat rate contribution in respect of each workman even when benefits are provided for dependents. Thus there is no attempt to make the individual workman contribute on a strict actuarial basis. It is the scheme as a whole that must be sound. But the resulting flat rate benefits, even when supplementary benefits for dependents are provided, are not satisfactory. A workman whose normal standard of living is \$20 a week wishes to have benefits higher than those which can be provided for a workman whose normal income is \$10 a week. Although benefits must be below normal wages if malinger is not to be stimulated, a rate of benefit which will not threaten the morale of the lowest paid laborer will obviously be too low to meet

the needs of highly paid workmen. This difficulty is generally met by varying the amount of benefits directly with wages. In certain countries members are divided into wage groups and contributions and benefits are made to vary according to the class. In others a sliding scale is contrived so that benefits bear a definite relation to the actual wage. Except in the most generous schemes workmen still lose substantially during sickness, for the usual benefit varies from one half to two thirds of the basic wage. Some therefore buy insurance in two or three funds but receive the employers' and the state's contribution only in one.

A waiting period of from one to four days before benefits become due is almost universally required on the ground that it eliminates the investigation and the excessive costs of paltry claims. It is more difficult to defend the usual limitation of benefit to twenty-six weeks or a year; if the illness is of long duration, private savings will presumably be exhausted and the need become greater. Invalidity pensions, however, are increasingly provided as a substitute. In the British scheme the insured after the receipt of twenty-six weeks' sickness benefit is entitled to disablement benefit compensated at half the previous rate. In Germany a special machinery is concerned with invalidity. Some thirty geographical organizations take the place of the thousands of sickness funds to deal with cases of long or permanent illness; and it is claimed that this has increased interest in the prevention of tuberculosis, alcoholism and other diseases. Limitations on benefits, which may also include residence and contribution requirements, have been variously justified. It is held by some that benefits are meant to supplement individual provision against loss. Others, who accept the theory that the ideal insurance must cover the total loss, favor restrictions on the ground that they reduce costs and consequently the burden of contributions and at the same time discourage malingering.

Even though benefits are limited, the costs of social insurance equal a substantial percentage of total wages. Under the Five-Year Plan of the Soviet Union the costs of insurance are borne entirely by the undertakings and are regarded as a direct supplement to wages—13.4 percent in 1931–32. In Germany at the end of 1930 contributions to sickness insurance funds accounted for between 5 and 5.5 percent and all branches of social insurance taken together for between 17 and 18 percent of the wages of the insured popu-

lation, and yet benefits had to be curtailed. In all countries with comprehensive systems of social insurance the amount is between 10 and 20 percent of wages; of this about one quarter to one third goes for health insurance. In spite of the advantages of joint contributions there is a growing sense that they hide the real incidence of the burden. Economic theory suggests that in the long run the worker bears not only his own share but also, as citizen and consumer, the employer's and part of the state's contribution as well. But it cannot be denied that before the necessary adjustments have taken place a new scheme or a new charge on the employer has all the disadvantages of a poll tax. There is therefore growing support for the view that social insurance measures like those relating to education and public health should be supported by the public treasury.

With the growth of interest in the preventive aspect of public health emphasis has shifted from monetary benefits to treatment benefits and from these to healthy conditions of working and living. It would be idle, however, to claim that health insurance is directly responsible for the new interest in preventive medicine. Rather, the limited resources available suggest that greater coordination of all branches of health work would better promote the public welfare. Certain useful devices may, however, be traced directly to health insurance. Thus the Bulgarian scheme provides for the promotion of healthy dwellings and hospitals. The Central Institute of Czechoslovakia has developed an investment policy which aims both at improving the medical equipment available and at giving facilities for mortgage loans, the erection of workers' dwellings and the development of roads. In the same way the various funds which have a claim on their resources allow the average institute supplementary dental, massage, radiotherapy or convalescent treatment and even retraining facilities for their members.

The role of national health insurance in the improvement of the public health is difficult to determine, for while public hygiene is improving, medical knowledge is increasing and the standard of education is being raised. The phenomena of increasing claims for insurance benefit in Britain and Germany, regarded by some as evidence of malingering or of the dangerous growth of drug taking, can perhaps better be ascribed to greater interest in good health, eagerness for treatment in the early stages of illness and changes in the age and sex distribution of

the working population. The more frequent medical treatment and monetary benefits definitely lessen anxiety and improve the general health, and they have been a substantial factor in increasing longevity.

Voluntary health insurance has still survived in spite of the rapid acceptance of the compulsory principle. Certain countries, like Sweden and Belgium and parts of Switzerland and South America, still rely on the older devices of mutual aid as reenforced by the government. In Sweden the formation and administration of insurance funds is left to the insured themselves; but if the administration satisfies certain conditions, if it excludes profit making and submits to supervision as provided by the act of 1923, subsidies are granted from the national treasury and from the communes in order to help cover the risks of sickness, maternity and funeral expenses. Members of the subsidized Danish mutual benefit funds automatically become insured with the state invalidity fund under the act of 1921. The chief objections to independent subsidized sickness insurance are that the period of benefits is limited, that medical attendance is not regarded as adequate, that the contributions of employers are uncertain and inadequate and that hundreds of funds are established which not only do not constitute the most efficient and cheapest machinery of administration but materially obstruct the introduction of a national system dealing with ill health and accident.

In almost all countries there are portions of the lower middle classes not protected by either compulsory or voluntary legislation, while in some countries, notably the United States, no such legislation exists. To a certain extent the insurance needs of these lower income groups have been met by the organization of friendly societies, fraternal orders, trade union benefit funds, employers' relief funds and similar schemes. But especially in the United States casualty and life insurance stock companies have in recent years underwritten the bulk of both accident and health insurance. Commercial accident insurance, which originated as ticket insurance in England in the middle of the last century when the dangerous new railroad travel became general, was quickly introduced into America. Commercial health insurance, utilizing the experience of the friendly societies and the German miners' funds, developed at the same time.

In the United States certain companies which have had considerable success with non-industrial accident insurance have had very little with

insurance against ill health. Indeed, wherever experiments have been made with a policy form for non-cancelable accident and health insurance, whether in Germany or in the United States, the experience has not been a happy one. Some of the companies have had disastrous experiences and have definitely withdrawn from this field; others have not pushed the matter with enthusiasm. Similar results have followed the offering by life insurance companies of "permanent and total" disability benefits. Sound schemes could no doubt be developed if there were available adequate morbidity and mortality rates on which reliable expected experience could be based for different industries, e.g. wage groups, age groups, sex, if a careful selection were made of risks and if adequate reserves were built up. Such data and methods have been lacking in the past and without them the schemes introduced by various countries have often proved untrustworthy.

In America the early failures led to a belated attempt at caution; but the two main devices adopted toward this end have not been popular. They are: the medical examination required of the applicant, which is even more rigid than that for life insurance; and the system of rates for non-cancelable insurance, which differ from those granted for commercial accident and health insurance in that they increase by age. An adequate insurance against accidents and ill health, if taken out for every member of a family of three, must cost the family \$125 to \$150 per annum, a very heavy burden even on the middle class and prohibitive for the working class. A less comprehensive scheme to reduce the anxieties of serious illness for the middle class family was adopted in England in 1925 and promises greater success. At the rate of from £3 to £4 a year it provides for the insurance of doctors' bills and all medical and nursing fees. The benefits include consultant fees, X-ray examinations and radiotherapy, operating surgeons' fees, surgical appliances, abnormal childbirth and hospital nursing charges. Minor illnesses are not provided for since doctors' bills for these will not cause undue strain. Insurance providing against the heavy cost of surgical operations is a still cheaper risk to cover. But although this type of insurance meets the need for extra expenditures during illness it does not provide a substitute for loss of earned income. In certain types of cases, where statistics are inadequate, where the number of those desiring protection against a particular risk is small and irregular

and where consequently no regular proposal form is issued by an insurance company, it is still possible to register an individual insurance. Through Lloyds' a doctor may insure or reinsure his eyes, a violinist his fingers, a singer his throat.

The practise of conducting insurance schemes as a form of newspaper advertisement is common in a number of countries. At the outset these benefits were limited to exceptional risks, such as death or total disability due to railway accidents, lightning or earthquakes, but as statistics accumulated they came to cover more usual risks, such as those resulting from fire and motor accidents. Sometimes the benefits are confined to regular subscribers of the paper, sometimes to those who use its advertising columns and sometimes to any buyer. Certain schemes commit the newspaper to little more than *ex gratia* payments. The premium consists in the difference between the amount paid for the paper and the amount at which it could be sold if this bonus were not attached to it. The newspaper may insure its risk with a company or be a self-insurer. Self-insurance is open to criticism as particularly liable to abuse since many subscribers believe that they are covered when in fact they are not.

An attempt has been made to counteract the inadequacy and expense of small individual insurance by the writing of group insurance covering such risks as employee disability or loss of school fees through sickness. But employee group insurance, which at its best is arbitrarily limited to a fraction of the population, is criticized as a paternalistic device anchoring the workman to a certain spot. The inability of insurance companies to distribute insurance protection against non-industrial accidents on a voluntary basis is illustrated by the recent tendency in various countries to make insurance of third party automobile liability risks compulsory. At the present time the total premium income of roughly \$250,000,000 of all the groups writing health and accident insurance barely exceeds that of workmen's compensation or automobile liability insurance. Only through compulsory state insurance can all those needing sickness and accident insurance be guaranteed protection at a minimum cost. But the movement for health insurance legislation in the United States, which followed the passage of the British national health insurance measures and culminated during the World War in the appointment by nine leading industrial states of investigating commissions, four of which submitted af-

firmative reports, has largely disappeared. Interest has shifted to such preventive projects as health centers, group medicine and the minimizing of the cost of medical care.

HEALTH, PUBLIC. *See* PUBLIC HEALTH.

HEARN, WILLIAM EDWARD (1826-88), Australian political scientist and economist. Educated at Trinity College, Dublin, Hearn was appointed in 1854 professor of history, literature, logic and political economy in the newly organized University of Melbourne, where in 1873 he became dean of the faculty of law. He contributed brilliant articles to the press, was active in politics and as member of the Victoria legislative council took an important part in the work of codification.

Hearn was rightly described by Dicey as "one of the most distinguished and ingenious exponents of the mysteries of the English constitution." His *The Government of England: Its Structure and Its Development* (Melbourne 1867, 2nd ed. 1887) anticipated Bagehot's epoch making work and explained the structure and function of the English constitution by reference to the facts of its historical growth. His economic treatise, *Plutology: or the Theory of the Efforts to Satisfy Human Wants* (Melbourne 1863), although less important than his work on government, was admired by Jevons and described by Marshall as "at once simple and profound." He begins with the analysis of human wants and maintains that their satisfaction depends upon two chief factors, labor and natural agents, for each of which he distinguishes between natural and acquired powers. In its operation upon natural agents labor receives the aid of the human devices of capital, invention, cooperation and exchange. His anthropological study, *The Aryan Household* (London 1879), is regarded at present as of negligible value.

Hearn was distinguished by his preference for a strictly scientific approach to economic and political problems and by his endeavor under the influence of Darwin and Spencer to explain the development of social institutions in terms of evolution. His aim, in the Baconian phrase

which he was fond of using, was "light, not fruit." In his *Plutology* he complained that the theory of wealth had been neglected by previous writers in favor of the art of political economy; and his *Government of England* helped according to Spencer to graft the theory of evolution on history.

R. C. MILLS

HEAVY CHEMICALS. The heavy chemical industries in general include all those enterprises which turn out bulky chemicals cheap per unit of weight. The consumption of raw material and the output of finished product normally run into the thousands and millions of tons and into the tens and hundreds of millions of dollars. The manufacturing processes usually involve merely the moving, grinding, mixing and separating of large quantities of solid, liquid and gaseous masses. From beginning to end the reactions take place automatically and continuously within huge chambers, gigantic vats and mountainous reaction towers connected by a labyrinthine network of pipes, conduits and other conveyors. Requiring large ground space and ample facilities for waste disposal, the plant is ordinarily established where acid fumes and other noxious substances do minimum harm to vegetation and man; that is, by preference in a desolate area not too far away from a harbor or other crossroads of economical transport. In the United States the few laborers that are needed are frequently foreigners or Negroes, wholly unorganized, working from ten to twelve hours a day at low pay. The industrial sickness and accident rate is usually lower than average; the primary risk is that of fall of person, while less than a third of the injuries are due to explosions, burns or poisonous and corrosive substances. The duties are mere routine. Even the task of controlling the works rarely requires more than a single chemist or engineer.

Usage and opinion vary considerably as to the specific industries possessing these general economic characteristics, but in most countries at the present time the heavy chemical industries include the following manufactures: sulphuric acid and other mineral acids; soda ash and other alkalis; fertilizers including phosphates, nitrates, potash salts and ammonium sulphate; bleaching compounds and other electrochemical products; the alums and vitriols; salt; sulphur and pyrites. Frequently soaps, glasses, ceramic wares, lime, cement and industrial gases are also included. In Great Britain the chief branches have tended to

group themselves into one alkali industry, whereas in the United States there has been more localization.

Of the heavy chemical industries the two most typical and the only ones to receive further consideration here are sulphuric acid and soda ash, representing the two most essential chemical agents or tools, namely acids and alkalis. Sulphuric acid while only one among a score of acids produced to the extent of tens of millions of dollars annually is used throughout the whole range of modern industry. Although in the United States the fertilizer industry normally consumes a fourth and petroleum refining and chemicals each a fifth of the total supply, the remaining third is used in so many processes, such as steel pickling, metallurgy, tanning and bleaching, that the consumption of sulphuric acid has since the days of Liebig been considered a faithful index of business activity. Soda ash, similarly, while only one among dozens of soda products far exceeds in aggregate value or social importance such better known chemicals as dyestuffs or potash. Two fifths of the total production are normally used to make glass and an eighth goes into soap; the remainder makes possible the manufacture of other chemicals, wood pulp, rayon, mercerized textiles, water softeners, cleansing compounds and other articles too numerous to mention.

Sulphuric acid while known to Geber, Valentinus and other alchemists searching for an alkahest and much experimented with by Paracelsus and other iatrochemists interested in sulphur medicines was first used industrially in sixteenth century metallurgy. But it continued to be prepared in glass retorts in laboratory quantities until the middle of the eighteenth century, when the rapid development of the textile industries brought about tremendous changes. The discovery by Barth of Saxony in 1744 that indigo when sulphonated would dye wool caused a considerable outburst of activity in the fuming acid industry of Bohemia and of Nordhausen, Germany. The discovery that the acid would bleach linen, performing in a few days in one operation what formerly had required several months, led to the first manufacture on a commercial scale of ordinary, or 50° Be., sulphuric acid. Roebuck established the first successful chamber process plant at Prestonpans, Scotland, in 1749. As the textile industries took root, lead chamber plants were set up in other countries; the first in France was founded by Holker at Rouen in 1766, the first in the United States by Harrison at Phila-

delphia in 1793 and the first in Germany at Potschappel near Dresden in 1820.

After 1790 the sulphuric acid industry, particularly in England, became for nearly a century an activity ancillary to the manufacture of alkali. For the surge of economic demand, on the one hand, and of scientific progress, on the other, brought on its crest the first notable triumph in industrial synthesis, the making of artificial soda. The textile industries needed large quantities of dyes, soap, detergents and bleaching compounds. These had been made with the aid of potash and barilla, the former derived from Russian and American forests and Scottish kelp, the latter a natural soda obtained from the ashes of Spanish and Sicilian *Salsola kali* moss. When in 1775 prices rose to famine levels, the French Academy of Sciences offered a prize of 2400 livres for a commercially feasible substitute. The desired synthesis was achieved by Nicolas Leblanc, a pupil of Lavoisier, with the invention in 1791 in substantially complete form of the famous process for making soda which gave rise to the Leblanc soda industry. This discovery deserves to rank with that of Watt, for it marks the beginning of modern industrial chemistry. A soda works was erected at St. Denis by Leblanc in 1792 and others were built soon after at Rouen and Lille. But the disorders of the revolution, during which Lavoisier was guillotined and Leblanc harassed until he committed suicide, caused the center of scientific, inventive and industrial chemical activity to shift to England. Tennant patented bleaching powder in 1798 and began to manufacture it at St. Rollox near Glasgow. Losh made soda crystals at Newcastle as early as 1844. But soda ash, which requires in the first instance sodium chloride and sulphuric acid, was not manufactured on a large scale until 1823, when, the duty on salt having been repealed, Muspratt erected his plant at Liverpool. Soda soon displaced potash in commerce. It was imported even by the United States as early as 1830 and within thirty years a world wide export running into millions of dollars developed. The trademarks of English soda ash, bleaching powder, sal soda, caustic soda and Glauber's salts became famous in remote corners of the globe.

The English alkali trade also made its influence felt in certain countries furnishing raw materials. In 1838, for example, when Taix et Cie. raised the price of Sicilian sulphur from £5 to £14 a ton, English pressure broke the monopoly established by the king of Naples and

English capital acquired control of the deposits. This episode also led to the successful utilization of pyrites, with the result that before long the Spanish and Portuguese mines were also dominated by English interests.

Meanwhile in the midlands above the coal, salt and limestone deposits there sprang up a number of alkali towns, villages with drab buildings, corroded vegetation, and water supply and atmosphere so poisonous to man and beast that eventually, after perpetual damage suits had proved inadequate to compel the owners to lighten somewhat the oppressive burden of the social costs of their profit seeking, Parliament itself was forced to assume control. The alkali acts of 1863 and later years have served as a model for similar legislation against offensive wastes all over the world.

But the alkali industry was not to remain an English quasi-monopoly. The perfection by Ernest Solvay at Couillet, Belgium, of the ammonia soda process in 1863 enabled the Société Solvay to become the dominant factor in the world production and sale of soda ash. In 1873 Ludwig Mond after a visit to Solvay established the first English plant at Winnington. In 1876 ammonia soda production was begun by Solvay at Dombasle, France, in 1880 at Wyhlen, Germany, and in 1884 at Syracuse, New York. As a result not only did the production of Leblanc soda ash decline abruptly but the price of soda products fell by nearly 70 percent, as is indicated in Table I.

TABLE I

WORLD PRODUCTION OF SODA ASH BY METHODS AND PRICE OF SODA ASH, 1850-1908

| YEAR | PRODUCTION IN 1000 SHORT TONS, 58 PERCENT BASIS | | | PRICE PER TON OF SODA ASH F.O.B. EUROPE |

lated by the alkali acts, the Leblanc industry was forced to increase considerably the number of its products. Hardly a single material was wasted, whether by-product, such as copper, iron oxide, nitric acid, chlorine, sulphur and calcium chloride, or main product. Costs and prices of nearly all Leblanc products fell precipitously, partly as a result of this joint cost production but more directly as a result of numerous new processes, such as the Gay-Lussac tower, mechanical furnaces for burning pyrites smalls and salt cake, Shank's lixiviating pans, Gossage's condensers for making hydrochloric acid out of the waste gas, Glover's towers, Weldon's process for the recovery of manganese, Deacon's patent for producing chlorine, the Chance-Clans procedure for recovering sulphur from the tank waste and the like. The cost of 50° Be. sulphuric acid, for example, was reduced in the plant at Preston-pans from \$300 a ton in 1800 to less than \$6 in 1880, while the yield of acid for each 100 kg. of sulphur consumed increased from 111 kg. to nearly 300 kg. (306½ kg. theoretically possible).

After 1880 the rate of chemical advance accelerated. Literally hundreds of new uses were found for sulphuric acid and alkali. New processes and new, generally by-product, sources of supply were discovered. In the place of the Leblanc industry there sprang up a number of still larger independent sulphuric acid industries, ammonia soda ash works of enormous size, electrolytic caustic soda and chlorine plants by the dozen and a host of other manufactures too numerous to mention. World production in the sulphuric acid industry increased in geometric ratio; that of the United States nearly doubled in every decade. Table II indicates clearly the early dominance of Great Britain, the spurt of acid production in Germany accompanying

Source: Figures for 1913 and 1925 adapted from League of Nations, *International Economic Conference, The Chemical Industry*, C.E.I. 10 (Geneva 1927). Figures for 1867, 1878 and 1900 compiled by author.

Faced with the new competition and stimu-

the rapid growth of its dyestuffs industry, and the readjustment brought about in the economic conditions of various world powers by the World War.

Many of the advances in the sulphuric acid industry had world wide repercussions, for chemical science by making possible the utilization of new materials and uncovering new sources for the old frequently changed currents of international commerce overnight. In 1903, for example, by virtue of the Frasch process, whereby sulphur is melted *in situ* and pumped to the surface, the United States began to change its status from principal importer of sulphur to chief producer and exporter. As the Louisiana and Texas deposits poured sulphur on the world markets, production in Sicily declined by more than two thirds. The resultant unemployment and hardship were so great that in 1906 and 1921 the island was on the verge of revolution. In fact, complete stability was gained only after a series of international agreements. At present a central bureau and arbitration board in London tells the Sulphur Export Corporation (under the Webb-Pomerene Act) and the Consorzio Obbligatorio per l'Industria Solifera Siciliana not only where but even how much they shall ship and sell. The pyrites producers of Spain and Portugal were similarly affected, their exports to the United States falling from a million to less than a quarter of a million tons. The loss of so important an export contributed considerably to the depreciation of their currencies, helped to lower the real incomes of their workers and probably constituted an underlying generative force of no small responsibility in political upheavals.

Domestic American competitive conditions have been no less difficult. In the first place, sulphuric acid began to be produced as a by-product from zinc and lead smelters and from blast furnace gases in the copper industry. In one notable instance in 1907 the utilization of these waste gases came by a federal injunction which made the Tennessee Copper Company the largest producer of sulphuric acid in the world. The conservation of by-product sulphur dioxide gas has scarcely been begun; yet even at the present time, if one includes the acid made from "coal brasses" and spent oxide (a residue in the purification of illuminating gas) and adds the considerable amounts recovered from sludge in the chemical industry and in petroleum refining, more than a quarter of the total world supply of sulphuric acid comes from by-product sources. In the second place, 40 percent of the acid is

consumed where it is made, most of it in steel pickling and fertilizer works, explosives and dyestuffs factories and oil refineries. In the slack season these often dump acid on the market. Finally, there is the constant danger that existing plant and technique must be scrapped because of new processes. In 1898, for example, R. J. Knietsch of the Badische Soda- und Anilinfabrik invented the contact process for making oleum, or fuming acid. This not only shelved the century old Nordhausen industry and made necessary the world wide junking of acid concentration plants but also wrested away from the chamber process more than one third of the total market, its product being today exclusively used by the manufacturers of indigo and other dyes, nitrocellulose explosives and lacquers and the like. Numerous other processes, such as the Dorr-Liljenroth procedure, which produces the sulphate radical by using gypsum and carbon dioxide instead of sulphuric acid, or the numerous direct syntheses of nitric, hydrochloric, acetic and other acids, similarly threaten the very life of the industry. On every hand there exists intercommodity, interprocess and inter-industry joint cost competition.

In the same way the ammonia soda process is not without competitors today. Since the World War natural soda from California and Africa and by-product soda ash from paper mills have appeared, contributing in 1929 in the United States nearly a sixth of the total. Besides more than a score of electrolytic processes have also taken over a portion of the field since the Stroop electrolytic diaphragm cell was first put into operation at Griesheim in 1890. For although the most notable achievement of the electrolytic processes has been to produce cheap chlorine and bleaching products, thereby giving the *coup de grace* to the Leblanc industry, they have at the same time turned out from necessity a by-product caustic soda, a substitute for ammonia soda ash, in tonnage that in the United States is equivalent to more than a tenth of the total alkali supply.

Internationally the most outstanding development in the alkali industry since 1880 has been the growth of national self-sufficiency. The United States, for example, which in 1893 imported nearly 350,000 tons of soda products valued at more than six million dollars, began shortly before the World War, on balance, to export them.

Whether the growth of independent national units was due to public policy or business

* Figure for 1884.

Source: Figures for the United States have been adapted from *Mineral Industry*, vol. iv (1895) p. 58 for 1884 and 1894, and for the other years from the Census of Manufactures. For the other countries, figures for 1882 and 1894 are from Müller, G., *Die chemische Industrie* (Leipzig 1909) p. 191; for the other years figures have been compiled by the author.

strategy is hard to determine. On the one hand, in the 1890's tariffs on soda products were imposed or increased everywhere; particularly in France, in Germany and in the United States. On the other hand, even in the 1870's the policy of the Solvay brothers had been that of establishing branch factories in every country in which a good market existed. Patents and technical information were freely exchanged and prices and sales territories agreed upon, but production and marketing organizations were independent. In a short time these branch enterprises not only grew to enormous size but ultimately became absolutely autonomous and competitive, freely making and breaking international cartels and gathering under their management and financial control in their respective countries a large number of plants making other chemicals. Thus Brunner, Mond, and Company, Ltd., in England united in 1925 with a concern which they had driven into the manufacture of acids and industrial chemicals, the United Alkali Company, a defensive union formed by forty-five Leblanc soda producers in 1890. This ammonia soda enterprise is now the dominating factor in the Imperial Chemical Industries, Ltd. Similarly the Solvay Process Company in the United States and others combined in 1920 with the General Chemical Company, a horizontal consolidation of sulphuric acid plants formed in 1899. The result was the giant Allied Chemical and Dye Corporation. The alkali and acid industries have thus become integrated with electrochemicals, dyestuffs, explosives and a host of other chemical manufactures into combinations which can exploit mass research, rationalize joint cost production, unify technical and sales service, control patents and tariffs and manipulate consumer demand. Their great power for international and national good or ill presents an ever more urgent challenge to the existing

forms of institutionalized social and economic control.

HÉBERT, JACQUES RENÉ (1757-94), French journalist and revolutionary agitator. Hébert was of skilled artisan stock. He wasted his patrimony in an unsuccessful lawsuit and some years before 1789 left Alençon for Paris. He saved himself from the gutter by pilfering from a benefactor and on very little capital launched late in 1790 his journal, the *Père Duchesne*. He formed with Chaumette, Cloots, Vincent, Ron-sin and others a violently radical group known as the *Hébertistes*, operating first in Parisian municipal and club politics and then in the Convention itself. He was guillotined in March, 1794. Historians have agreed with surprising unanimity that Hébert was a scoundrel. His sordid career reveals but two points of interest, his contribution to the development of journalism and his place in the history of proletarian revolt.

The *Père Duchesne* was a personal journal of opinion, a series of pamphlets rather than a newspaper in the modern sense. Hébert's origi-

nality lies in his appeal to the lowest literate classes by sensationalism—especially in headlines which were cried by his newsboys—by pandering to the appetite for scandal, including, as witness his attacks on the queen, sex scandal, and by the use of the language of the people. This latter effect he very cleverly achieves by avoiding learned words, by borrowing undignified phrases from slang and above all by inserting in almost every sentence an oath or an expletive today unprintable. He alternates between a sentimentalism vulgarized from Rousseau and a virulence borrowed from Marat, whose successor, after July, 1793, he strove to become. Mallet du Pan estimated the circulation of the *Père Duchesne* at 80,000, which is probably under the truth.

The influence of the *Hébertistes* as a political group rested almost entirely on the hold which they had on the Parisian proletariat. Their actual program, however, foreshadows modern socialism hardly at all—much less than that of the *Enragés* (Roux, Varlet), another Parisian group sometimes loosely but erroneously confused with the *Hébertistes*. Jaurès has nothing but contempt for the empty mouthings of Hébert, whom he regards as a place hunting politician. The *Père Duchesne* is full of attacks on the corrupt rich and supports the maximum on prices as a necessary part of the revolution. In issue number 245 Hébert goes so far as to favor a redistribution of lands in favor of the small holder. But the *Hébertistes* had no definite plan of social reorganization; they were aggressive militarists and toward the end patriots, and their violent policy of uprooting all forms of Christianity was hardly more than a screen for their plunderings. Their tactics, however, helped to form the Jacobin tradition of direct action, and their very existence was a proof of the potential political power of the lower classes.

HECKER, JOHANN JULIUS (1707-68), German educator. As a student at the University of Halle, Hecker came under the influence of the

Pietist movement and the educational theories of A. H. Francke, under whom he taught for a time. In 1739 he became pastor of Trinity Church in Berlin and as supervisor of the schools of his parish at once devoted himself to their improvement as an agency for social welfare. In 1748 he opened a private school for the preparation of elementary school teachers and in 1752 received state aid and royal recognition. His success led to invitations to reorganize other systems of elementary education in Prussia. In 1763 Frederick the Great requested Hecker to draft a code for Prussian elementary schools, which was enacted in that year as the *Generallandschulreglement* and continued to serve as the legal basis of education in that state.

Hecker's chief contribution to education lay in the provision of a differentiated program of secondary education. On the basis of his elementary schools he built up the traditional Latin school and what he called the *Ökonomisch-mathematische Realschule*, opened in 1747 and intended for those who did not plan to proceed to the universities but were destined to enter everyday occupations in commerce, trade and industry. The idea was not entirely new, but under Hecker and his associate Johann Friedrich Hahn it succeeded for the first time. While Latin and French and other secondary subjects were retained, the emphasis was placed on practical subjects, not so much to develop vocational skill as to cultivate general intelligence in the world of everyday life. Through both the elementary schools and the *Realschulen* Hecker hoped to develop the economic resources of Prussia and encourage home manufactures to replace imports from abroad.

HEDGING is a form of protection against an economic risk, usually the risk of price changes, which is effected by offsetting against one another two transactions involving risks of opposite character. The commonest form of hedging is that which is effected through the use of futures contracts (see COMMODITY EXCHANGES),

agreements to buy or to sell at some future date, in the speculative commodity markets. A merchant who has to carry a stock of grain, cotton, crude rubber, sugar or other staple commodity for which there is an organized market protects himself against a decline in price by selling an equal amount for future delivery, while a manufacturer who has contracted to deliver a product into which one of these staples enters as raw material protects himself against a rising price by buying for future delivery a quantity of the raw material equal to that which he intends to use. When the trade transaction is completed—not necessarily at the time of the expiration of the futures contract—in the first case by selling out the stock, in the second case by buying the raw material, the original transaction in the futures market is reversed. Commodity hedging originated in the Liverpool cotton market in the years following the American Civil War and became an established practise in the United States after 1870. It is widely used in staple commodity markets, particularly those for cotton and grain, but it is impossible to make a close estimate of the actual number of hedging transactions.

Outside the commodity markets the most important application of the hedging principle is in connection with the risk of fluctuations in foreign exchange. When a merchant buys or sells goods for future payment in a foreign currency he runs the risk that a change in the foreign exchange rate before the settlement date may subject him to heavy losses. To avoid this risk he may take advantage of the market in "forward" exchange. The forward exchange rate, which is the price of a foreign currency for delivery at a future date, may be either higher or lower than the spot price. As between countries with stable currencies, the variation of the future from the spot exchange is relatively slight and depends largely upon the relation between interest rates in the financial centers of the two countries. Where one or both currencies, however, consist of irredeemable paper, the variation between the spot and the future price may be much larger, reflecting the uncertainty as to the future course of the exchanges. Quotations of forward exchange rates were regularly made before the World War, but the uncertainties of foreign exchange in the early post-war years have made resort to this form of hedging more frequent.

The protection furnished by hedging is never perfect. To eliminate the risk of price changes

completely it would be necessary that the relationship between the futures price and the cash price at the time the hedging contract is closed should be definitely predictable on the basis of the relationship at the time when the hedging begins. In fact there is nearly always some fluctuation from month to month in the relationship between the cash price and the various future prices. For instance, a temporary shortage caused by delayed harvests, bad roads and transportation difficulties will cause cash prices and nearby futures to rise above the distant futures, and there is no way to hedge against the decline in prices which will later wipe out these differentials. Another reason for the incomplete elimination of risk is that the futures contract nominally calls for a delivery of a contract grade of a commodity for which some other grade may be substituted at a stipulated premium or discount. The relationship between the price of the commodity actually held or desired and the price of the contract grade or that which may be substituted for it is subject to some change. But the changes in the differences within the price structure are much smaller than those in the spot price over a period of time; what hedging does is to substitute for the risk of the large change in the spot price the risk of the small change in the relationship between future and spot prices and between prices of various grades.

Nor does hedging eliminate even that part of the risk against which it protects the hedger. It merely transfers it to those whose speculative operations make the hedging market possible. For it is impossible to run a hedging market without speculators. It is not necessary to find a speculator for every individual transaction, because the purchases of a hedging manufacturer and the sales of a hedging dealer in raw material may occur simultaneously. But this coincidence cannot be relied upon. For satisfactory hedging the market must not be "thin"; that is, it must be possible at any moment to make considerable purchases or sales without driving the market materially higher or lower. The only way in which this continuity can be maintained is through the operations of a body of speculators who stand ready to buy on small recessions and sell on small advances.

It is often assumed that since hedging sales tend to be concentrated at certain seasons the price of futures is depressed at such seasons to the advantage of the speculators who furnish the contracts. But there is no statistical evidence of such a tendency. On the contrary, it is probable

that the hedging system is supported, at least in large part, by the losses of speculators.

Viewed solely from the standpoint of producers and consumers of the commodities which are handled on the futures markets, there can be little doubt as to the economic usefulness of the hedging system. It enables a merchant or manufacturer to protect his trade profit against the risk of loss of more than a minor fraction of the price change and therefore to figure his prices much more closely. It also makes it possible to borrow against a storage stock of grain or cotton a much higher proportion of its value. For both these reasons hedging enables the merchant or manufacturer to do business on a much smaller capital and thus reduces his costs.

HEDONISM belongs to the relatively small number of deliberately manufactured words. Derived from the Greek *hedone*, it dates from about the middle of the nineteenth century and owes its origin to that romantic and scholarly friend of Wordsworth and De Quincey, Professor John Wilson of Elleray, who is said to have divided his life between the "sincerest devotion to letters and the stormiest pleasures of life." Although the word is modern, the theory of conduct which it designates, that the ultimate end of action is or should be pleasure, was already well developed in the classical age of Greece. The historically recognized founder of the theory is Aristippus of Cyrene, one of the older pupils of Socrates (see CYRENAICS). In a certain sense the doctrine is, however, ascribed

to Socrates himself, for example, in the dialogue *Protagoras*, and it was discussed in that dialogue because it represented one of the significant social issues of the day. If the records covering the competing social theories of the period were not so largely destroyed they might show that the pleasure philosophy had a wide vogue: that the sophists adhered to it; that in one form or another it was held by materialists like Leucippus and Democritus; that it was the creed espoused by many of the foremost men of affairs.

The hedonist selected for discussion by Aristotle was the eminent mathematician and astronomer Eudoxus, who "held that pleasure was the good, because he saw that all things, whether rational or irrational, make pleasure their aim. He argued that in all cases that which is desirable is good, and that which is most desirable is most good; hence the fact of all things being drawn to the same object is an indication that that object is the best for all" (*Nicomachean Ethics*, tr. by J. E. C. Welldon, London 1927, II: 1). The two sides of hedonic theory—that pleasure is sought and should be sought—which eventually gave rise to the distinction between psychological and ethical hedonism, are obviously suggested in this citation, as they are in fragments remaining from the writings of other Greek philosophers. The two aspects—the descriptive and the normative—were thus present from the beginning. This is likewise true of certain problems which have attached to the hedonistic standpoint: Do pleasures and pains differ only in degree? If they do, how can this difference be measured? Are pleasures and pains of the body more or less intense than those of the mind? Should the pleasure of the moment or long time pleasure be the final criterion? Is a succession of many and varying pleasures preferable to the agreeable feeling of serenity which accompanies the normal functioning of simple living undisturbed by pain, care or anxiety?

Consideration of these questions resulted in basic disagreements. The authoritative answers were formulated by Epicurus, who was the most successful advocate and systematizer of hedonic theory in the first period (see EPICUREANISM). Separated by three generations from Socrates, he lived in a Hellenistic society in which the bounds of former city-state life had been broken or widened and all philosophies were characterized by lack of social faith. This fact as well as the individualistic character of Greek psychology gave early hedonism an egoistic twist. In spite of his emphasis upon pleasure—

for Epicurus never questioned the central doctrine that the end of action is the maximum of pleasure for the actor—his philosophy, although often differently interpreted, demanded self-denial; it demanded monklike detachment not only from the pursuit of pleasure as ordinarily understood but from the customary and everyday interests of men. Unlike Aristippus he believed that the pleasures of the mind and of friendship were of the first importance because of the cumulative effect of memory and anticipation; and the highest degree of satisfaction was to be gained not through an endless round of fugitive pleasures but in a neutral state of cheerful tranquility, free from the pain of unsatisfied desire and unruffled by the pleasurable excitement of satisfying multitudinous wants. Epicureanism as conceptualized and practised by its founder entailed a severely simplified scheme of living from which the allurements and rewards offered by contemporary civilization were ruled out, along with the associated anxieties and fears, including those pertaining to the gods and the hereafter. The true Epicurean was expected not to fall in love, not to become the father of a family, not to mix in politics, not to indulge in pleasures of the table, not to surrender to moral and religious superstitions. In other words, Epicureanism, like Christianity, was an extracommunity enterprise. On the surface the program seems negative, and it is usually so described. It was not so regarded by Epicurus. In his opinion the sequestered group way of life which he advised yielded the purest and most positive kind of pleasure attainable under the circumstances.

Epicurean hedonism was attractively presented to the Roman world by Lucretius and won a large following. The early leaders of the Christian movement, on the other hand, were antipathetic to it, as were the church fathers and the mediaeval schoolmen. This antipathy accounts largely for the subsequent misinterpretation of the term. But following the Renaissance and the rise of science hedonism reappeared. Probably there is no more "hard-boiled" hedonism on record than that of Thomas Hobbes, who revived the doctrine in the seventeenth century. Hobbes was the first clearly to recognize the psychological and ethical aspects of hedonism and to combine them consciously in a unified conception. Self-interest, represented in appetites and desires, especially the love of power, constituted, as he saw the matter, the sole and only possible motivating force of human action. Anything which became the object

of a man's appetite or desire was that "which he for his part called *good*"; anything which aroused his hate and aversion he called "*vile and inconsiderable*."

Hobbes' thinking was set in the context of the modern state. He could not realistically believe that the greatest sum of satisfied desire was obtainable by individuals through ruthless reliance upon their own powers, as in an early condition of nature, nor by stepping out of society into comparative isolation; he felt that it must be achieved within and by means of social organization and social institutions. It is here that hedonic theory took a new turn. Hobbes made the crucial transition from psychology to ethics. If the state is to be an agent in the realization of the individual's desires, the individual, on his side, must acknowledge correlative obligations or the scheme will break down. And this gives rise to duties with an ethical meaning not included in more elementary hedonism. Ethical hedonism is no longer merely pleasure-wisdom concerned with deciding upon the line of conduct calculated to lead most directly to the greatest pleasure. The state has come into existence as a rule maker and umpire in the universal game of pleasure seeking. The relation of the established rules to the individual's desires is assumed to be real but it is indirect and frequently not obvious. The rules must in any case be acknowledged as binding so long as the state can insure the continuance of the game and the game itself is reasonably effective in securing the intended result.

In his revival of hedonism Hobbes shifted authority over men's desires from the church to the state. He brought the hedonist into society. Yet the position remained essentially egoistic; it remained so until expanded by the repercussion upon hedonism of the philanthropic and social reform spirit of the eighteenth and nineteenth centuries. Hume, Hutcheson, Adam Smith, Bentham, Hartley, J. S. Mill, Bain and others contributed to this broadening influence. In Bentham hedonism became universalistic utilitarianism, although the word utilitarian was not brought into use until later by Mill. "Nature," Bentham asserted, "has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do." His telling elaboration of this principle and his detailed application of it remain a monument to creative genius. Especially did he devote attention to the troublesome question of the hedonistic calculus, giving sugges-

tions regarding the measurement of pleasure units in proposed satisfactions. But most significant was his enlargement of the hedonic conception to include the ideal of the "greatest happiness of the greatest number." What he had in view was happiness for people generally, "everybody to count for one, nobody for more than one." The inclusion of others within the range of the individual's interest involved hedonism in logical difficulties. It had to be shown that the individual's happiness, properly understood, coincided with the general happiness or that men actually experience a fellow feeling with the misery and happiness of others or that the happiness of all can be connected with the happiness of each by appropriate legislative and other social spurs. Some of the best writing and thinking in social ethics was called forth by this problem, and the entire associationist psychology was mustered into service to bolster the hedonic view.

Further enrichment was introduced by John Stuart Mill through giving real flavor to altruism and stressing the importance of making qualitative distinctions between pleasures. In both respects he is thought to have betrayed his avowed hedonism. As between the agent's "own happiness and that of others," said Mill, "utilitarianism requires him to be as strictly impartial as a disinterested and benevolent spectator." And whereas Bentham had said, "quantity of pleasure being equal, push-pin is as good as poetry," Mill asserted in an equally well known passage, "it is better to be a human being dissatisfied than a pig satisfied; better to be Socrates dissatisfied than a fool satisfied." If Mill's hedonism is taken to be of the orthodox pleasure-unit type, the modifications he introduced are, as has often been pointed out, inconsistent with his original premises; but if he is allowed to regard various satisfactions as unique, as irreducible to a common quantity scale, the argument that some are preferable to others may not be illogical or contrary to more recent psychological insight.

Hedonism as a system of descriptive psychology dominated British thought during the formative years of the rise of classical economics. From Ricardo to Jevons economic theorists used it as the substratum of their central price and value doctrine. The "economic man" performed his market calculations in terms of the satisfaction and pleasure he would derive from a transaction or the pain and effort it would cost him. In Veblen's ironic phrase, he became "a lightning calculator of pleasures and pains." As the emphasis on subjective value increased in the

theory of Jevons and the Austrians, utility and disutility became the central psychological terms, and the hedonic calculus was further refined through the theoretical device of marginalism. In English juristic theory of the nineteenth century also hedonism strengthened the victory of the analytical school. Since the individual was conceived to respond dominantly to pleasures and pains, the sanctions of state force were regarded as sufficient to create and sustain law. In both economics (see ECONOMIC INCENTIVES) and jurisprudence a more complex psychology has come to challenge and invalidate the too simple and artificial assumptions of hedonism.

The hedonists deserve credit for drawing attention to the idea that life should justify itself in terms of satisfaction to those who have it to live. Moreover, modern representatives like Bentham and Mill have battled zealously for the improvement of social conditions. If hedonism has gone wrong, it has been because of the conviction that an abstract something called pleasure is what men seek to enjoy or that an abstract something called pain is what men seek to avoid, in all the various things they do. This has committed hedonists to the futile undertaking of devising a mathematical calculus for determining relative quantities of pleasure and it has diverted them from the study and control of concrete objective stimuli. And as they have misconceived enjoyment as a psychic atom, so they have misconceived man as a social atom, even when they placed him in society. The formative periods of hedonism have been contemporaneous with social epochs when the break up of a customary manner of life and the conflict between traditional and newly developing authorities put undue emphasis upon a particular kind of individualism. The atomistic social psychology congenial to hedonism is no longer tenable. And the contemporary thinker is appreciative of the fact that since man as a desiring organism responds to a given environment, this environment is implicated in his desires. One result is a shift of observation, study and social planning from subjective states of feeling to the objective content of life. The hedonism which persists is either out of touch with the social meliorism of the time or has merged its identity with such contemporary movements as pragmatic instrumentalism.

HEEREN, ARNOLD HERMANN LUDWIG (1760-1842), German historian. Heeren began his career as a theologian but later turned his interests to classical philology and history. His entire life was dominated by Winckelmann's and Goethe's conception of Greece. His philosophy of history was largely determined by Herder, his interest in constitutional history and political geography was awakened and promoted through the influence of Montesquieu and his preoccupation with problems of economic history may be traced to reminiscences of his Hanseatic childhood.

Heeren is one of the forerunners of the historical school in history, economics, jurisprudence and political science. With Niebuhr he may be considered the founder of the modern scientific study of ancient history; through his pupil Pertz he stimulated the critical study of mediaeval sources; his interest in constitutional history left its mark on Waitz, and his study of political geography on Ritter. Although the importance of his diverse writings has been overshadowed by the greater work of Niebuhr and Ranke, yet the effect of his basic work in modern political and especially commercial history, contained in his *Ideen über die Politik, den Verkehr und Handel der vornehmsten Völker der alten Welt* (3 vols., Göttingen 1793-1812; 4th ed., 6 vols., 1824-26; tr.

by D. A. Talboys, 6 vols., Oxford 1833-34) and his *Handbuch der Geschichte des europäischen Staatensystems und seiner Kolonien* (Göttingen 1809, 4th ed. 1822; tr. by George Bancroft, 2 vols., Northampton, Mass. 1829), is still perceptible.

Heeren maintained a reserved and even indifferent attitude toward the decisive national and political problems of his day. But he combined this indifference with an active, pedagogical mind which sought to arrive at new points of view through a study of historical sources and with a conscious counter-revolutionary attempt to link the present with its historical roots in the past. His views on the system of European states and his approval of the weak structure of the old empire as well as of the German Confederation sprang from his acceptance of the universality of enlightenment and of classicism. His opposition to Adam Smith's atomic individualism, however, allied him with those holding a romantic and organismic concept of the state, and his disavowal of any confidence in progress and his opposition to the contract theory resulted in his having great influence in the nineteenth century. Impressed by Montesquieu's idealization of the English constitution, he championed a constitutionalism which sought more to curb the despotism of the masses than the sovereignty of the monarch. It was not so much his political ideas, however, as his sane judgment of political and constitutional history which made his significance so great and left its impress on such people as George Bancroft, Timkowsky, Turgenev and above all on Bismarck, Beust and Bunsen.

ARNOLD BERNEY

Works: Historische Werke, 15 vols. (Göttingen 1821-28).

Consult: Joss, H., A. H. L. Heerens politische Theorien (Berne 1918); Fueter, E., *Geschichte der neueren Historiographie* (2nd ed. Munich 1925) p. 385-89; Lütge, W., *Arnold Hermann Ludwig Heeren als Historiker* (ms. Leipsic 1925).

HEFELE, KARL JOSEPH VON (1809-93), German Catholic historian and theologian. Hefele was ordained a priest in 1833 and was professor of ecclesiastical history in Tübingen from 1837 to 1869. From then until his death he was bishop of Rottenburg. He first became famous through his *Der Kardinal Ximenes* (Tübingen 1844, 2nd ed. 1851; tr. by John Dalton, London 1860), especially because of his treatment of the Inquisition. Like Ranke and Leo he viewed it as a tool in the hands of princely absolutism.

forced upon the church and considered it in relation to the general spirit of the late Middle Ages. Hefele's life work was his *Conciliengeschichte* (7 vols., Freiburg 1855-74; vols. i-vi, 2nd ed. 1873-90; vols. viii-ix, completed by J. Hergenröther, 1887-90; partly tr. by W. R. Clark and others, 5 vols., Edinburgh 1871-96). He was the first to consider the councils in their relation to the organic development of the church and dogma and also dealt with their significance in the social and intellectual history of Europe. Although his work did not mark a new epoch in historical criticism he gave nevertheless the most objective and complete scholarly survey possible of the enormous mass of material, and his work is still indispensable.

As an expert on councils Hefele was consulted in 1868-69 regarding the organization of the Vatican council soon to be summoned. Both at the bishops' conference held in Fulda in 1869 and in the Vatican council he declared his opposition to the pronouncement of the dogma of papal infallibility, and in his pamphlet *Causa Honorii papae* (Naples 1870) he proved by the case of Honorius I that even popes had committed dogmatical errors. Later, however, he submitted to the new dogma for the sake of ecclesiastical peace.

WOLFRAM VON DEN STEINEN

Consult: Werfer, A., *Karl Joseph von Hefele*, Deutschlands Episkopat in Lebensbildern, vol. iv, no. 2 (Würzburg 1875); Roth, Hugo, *Dr. Karl Joseph von Hefele, Bischof von Rottenburg* (Stuttgart 1894); Schulte, J. F. von, *Der Altkatholicismus* (Giessen 1887).

HEFFTER, AUGUST WILHELM (1796-1880), German jurist. An early proficiency in classical philology led Heffter to historical studies and to an adherence to the historical school. His *Die athenäische Gerichtsverfassung* (Cologne 1822) brought him early fame and academic position. In his middle period, in which he turned to the German common law of his time, he added an interest in criminal law to his earlier interest in procedural law. But both his *Institutionen des römischen und deutschen Civil-Prozesses* (Bonn 1825; 2nd ed. with title *System des römischen . . .*, 1843) and his *Lehrbuch des gemeinen deutschen Kriminalrechts* (Halle 1833, 6th ed. Brunswick 1857) show his abandonment of the historical school; indeed they betray the influence of Hegelianism. In neither work, however, is there any great stress upon philosophical considerations. As a result of political and judicial activity, particularly after the revolutionary period of

1848, Heffter increasingly tended toward positivism and emphasized practical aspects.

It was his work in international law that brought Heffter his greatest fame. His *Das europäische Völkerrecht der Gegenwart* (Berlin 1844, 8th ed. 1888) was translated into French, Spanish, Russian, Hungarian, Greek and Polish. Its success was due not so much to the originality of its organization, which was based too much upon private law analogies, but to the richness of its content. Although it did not dispense with historical background it concentrated upon the consideration of contemporary problems and thus carried over the method which Heffter used in private law. Heffter's work gave German international law literature for the first time an influence beyond the borders of Germany.

MAX FLEISCHMANN

Consult: Rivier, A., in *Handbuch des Völkerrechts*, ed. by F. von Holtzendorff, vol. i (Berlin 1885) p. 486-88, and bibliography there cited; Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. ii, p. 298-300, 392, and 650-52; Heymann, Ernst, "Hundert Jahre Berliner juristen Fakultät . . ." in *Die juristische Fakultät der Universität Berlin*, ed. by Otto Liebmann (Berlin 1910) p. 3-66, especially p. 37-38.

HEGEL, GEORG WILHELM FRIEDRICH (1770-1831), German philosopher. Hegel was the son of a civil servant in Württemberg. He received a theological education at the University of Tübingen, but it was only in the subsequent period between 1793 and 1801 when he was intellectually isolated as a private tutor that his own historical studies in religion and politics led him to philosophy.

As a Protestant and a child of the eighteenth century Hegel began with faith in freedom and rational enlightenment, and he greeted the French Revolution with enthusiasm. He was stirred by Kant's view of religion as purely moral and free from all supernaturalism. But his interest in the historically actual and an element of naturalistic humanism acquired by continued study of Greek and Roman classics led him to ask how such pure religion could be embodied in the actual life of a nation. Reacting, as did Schiller and Friedrich Schlegel, against Kant's ascetic dualism between the *is* and the *ought*, Hegel was led by the example of his former fellow student Schelling to seek for an absolute union of nature and mind, so that the ideal could be viewed as embodied in the actual. Hegel's first book, *Phänomenologie des Geistes* (Hamburg 1807; tr. by J. B. Baillie, 2nd ed. London 1931), was a study

of the forms or stages of mind as embodied in diverse historic periods, social institutions and philosophic or moral systems. After the battle of Jena Hegel edited a newspaper and from 1808 to 1816 successfully served as rector of the *Gymnasium* at Nuremberg. His great treatise, *Wissenschaft der Logik* (2 vols., Nuremberg 1812-16; tr. by W. H. Johnston and L. G. Struthers, London 1929), brought him wide recognition and a call to Heidelberg, where he published his *Enzyklopädie der philosophischen Wissenschaften im Grundrisse* (Heidelberg 1817, 3rd ed. 1830; tr. in part by William Wallace as *The Logic of Hegel*, 2nd ed. Oxford 1892, and as *Hegel's Philosophy of Mind*, Oxford 1894), an outline of his whole philosophy. In 1818 he was called to the University of Berlin, where despite his previous admiration for Napoleon and contempt for Prussia he became a favorite of the government. His *Naturrecht und Staatswissenschaft im Grundrisse* (Berlin 1821; 2nd ed. by E. Gans as *Grundlinien der Philosophie des Rechts*, Berlin 1833; tr. by S. W. Dyde, London 1896) represents in the main a Restoration philosophy, like that of Savigny, Burke, de Maistre and the historical school; that is, a distrust of those who would reform existing institutions on the basis of abstract reason instead of recognizing that the actual is an embodiment of historical reason. The preface contained a contemptuous attack on Fries and other liberals who hoped for a better public life on the basis of popular education and more widespread interest and participation in government. Hegel was seriously depressed by the revolution of 1830 and rebuked his disciple Gans for venturing a liberal interpretation of the Hegelian philosophy. Shortly before his death he wrote a rather unfavorable account of the English Reform Bill.

As the outstanding philosopher of the nineteenth century Hegel profoundly influenced the social sciences by his general methods as well as by his specific views. Although not the first Hegel was one of the most influential leaders in the reaction against the abstract and artificial views of human nature and of the origin of social institutions that prevailed in the period of the Enlightenment. If government and religion are no longer viewed exclusively as inventions but rather as natural growths in which continuity and the inertia of the past are always to be reckoned with, the credit is largely due to Hegel. On the other hand, we also owe to Hegel as a result of his *Vorlesungen über die Philosophie der Geschichte* (ed. by E. Gans, Berlin 1837; tr.

from 3rd German ed. by J. Sibree, rev. ed. New York 1899) the attempt to write history, even the history of art and philosophy, in terms of abstract ideas representing periods without regard to the variations of individual men and their peculiar geniuses.

As an absolute idealist Hegel believed that his dialectic method, as developed in his *Logik*, represented the divine nature and plan of creation and was therefore the a priori key to all reality. The historically proved absurdities to which this method led him in the philosophy of nature cast a reasonable doubt as to its soundness in the more complicated questions of social science, on which he wrote with an amazing self-assurance. But although the perpetual triad of thesis, antithesis and synthesis as used by Hegel and his followers is not now in general repute, something like it underlies the popular method of tracing the evolution of human institutions through necessary stages. This type of a priori history, usually associated with the name of Spencer, undoubtedly has its roots in Schelling and Hegel. It may thus be said paradoxically that Hegel helped to introduce the organic and historical method into the social sciences and that of abstract ideology into history. This oscillation between dogmatic a priori rationalism and historic realism (some of Hegel's enthusiastic followers have called him the greatest of all irrationalists) shows itself in his specific social views.

Hegel's philosophy of law is in the main of the metaphysical type which clings to concepts that are high above, but do not advance, the analysis of actual problems. Thus his theory that property is the realization of the will, or of free personality, has appealed to many. But as one's property right in any object necessarily limits the right and freedom of everyone else, the real problems of the law of property are not thus adequately met. Similarly, there is a verbal nobility in Hegel's retributive theory that punishment carries out the will of the criminal. But those who hold other theories have urged that Hegel's views throw no light on the questions of what punishment is the suitable one for any given offense, what offenses should be treated with the leniency or mercy of the pardoning power and how society is to defend itself against dangerous aggressions by those who defy its laws.

In his ethics Hegel opposes abstract individualism and the absolute value that Kant set on the morality of conscience. For the good will has worth only if it is directed to a rational end from which can be deduced actual duties and

positive lines of conduct. Ethics must thus be essentially social. In the ethics of the family Hegel refuses to consider such empirical biological facts as the approximate equality of the number of men and of women. But in opposing the contractual view of marriage and the importance of romantic love he depends on the empirical psychological argument that mutual affection is more securely based on living together wisely.

While Hegel made no notable contribution to economics and rather uncritically admired Smith, Say and Ricardo, his influence was against laissez faire. In his treatment of the system of wants in civil society he emphasizes the salient facts not only that individual needs are interdependent but that there also exist family and group interests and that society is divided into distinct classes.

Hegel's main attention, however, is to the state, on which he lavishes all the honorific phrases at his bestowal. In a sense he may be said to have tried to revive the Aristotelian or Hellenic conception of the state as the organized life of culture. But although he rejects Hobbes' notion that the state rests on force or serves empirical human needs he is extreme in his emphasis on the need of security and on a unitary sovereign in the person of a hereditary monarch.

The glorification of the national state naturally makes Hegel cold to the Kantian cosmopolitan ideal of perpetual peace founded on a world federation of republics. Each national state is absolute and war is not only necessary but a spiritual good. Since ethics is embodied in the state and there is no sovereign over all states, they are in relation to each other in "a state of nature" not subject to genuine moral laws. They are not, for instance, obliged to keep their agreements. From this anarchic and amoralistic view of international relations Hegel tries to escape by regarding history as the court in which providence passes judgment on the various nations. This makes history a theodicy; but it also makes mere survival the test of national righteousness—a doctrine that misses the tragedy of history and is equivalent to Napoleon's dictum that God is on the side of the heaviest artillery. This phase of Hegel's doctrine, however, is covered by the use of logical instead of theological terms, by an attempt to show that development in time follows the order of the categories of logic. But, as the number of logical categories is finite, history completes itself in the Prussia of his day. Moreover to display this logical order one people and only one can at any time represent the world

spirit; the rest are negligible and have no rights.

Hegel's treatment of art as found in his *Vorlesungen über die Aesthetik* (2 vols., ed. by H. G. Hotho, Berlin 1836-38; tr. by F. P. B. Osmaston as *The Philosophy of Fine Art*, 4 vols., London 1920) follows in the main the method of his philosophy of history, despite the fact that theoretically it belongs on a higher plane than universal history and social ethics. The division of history into that of the Orient, classical antiquity and Teutonic Christianity leads to a view of the evolution of art in which the corresponding stages are the symbolic, the classic and the romantic. The control of the material by the ideal is imperfect in the symbolic stage and perfect in classic beauty. But romantic art indicates that the idea is beyond the material. If this schematism is too abstract to be historically valid it still serves to show many connections between art, religion and other national institutions; and this view of art as an integral part of the social life of a community has since been widely adopted. Hegel's observations on the various arts have generally been viewed as too intellectual and devoid of sufficiently distinctive vision or taste. But he helped to liberate art from romantic sentimentalism and gave it dignity—beyond mere pleasure, market utility or aid to moral preachment—by viewing it as a liberation of human energy and as a partial revelation of the inner processes of nature. Hegel also mediates between the older classic view of art as conformity to rules and the romantic view of art as capricious inspiration. His followers, Weisse, Rosenkranz, Fischer and others, have made a contribution in developing the role of the ugly in fine art. Hegel also did much to reveal the great importance of comedy.

In his *Vorlesungen über die Philosophie der Religion* (ed. by Philipp Marheineke, 2 vols., Berlin 1832; tr. from 2nd German ed. by E. B. Speirs and J. B. Sanderson, 3 vols., London 1895) Hegel attempts to get rid of the multiplicity of diverse religions by arranging them in a dialectically progressive order that begins with magic and natural religion; goes through the religion of China, India, Persia, Egypt, Judaea (the religion of sublimity), Greece (the religion of beauty) and Rome (the religion of utility); and culminates in Christianity as the absolute religion. In this attempt to put the history of religion into a procrustean logical bed Islam is left out altogether, for although the last in time it is not for Hegel the best. The orthodox were naturally not satisfied with Hegel's intellectual-

istic interpretation of the historical dogmas of Christianity, which made it an imaginative adumbration of the Hegelian metaphysics. And the non-orthodox pointed out that the limitations and relativity which Hegel found in other religions are also in Christianity. Hegel's view of religion, however, has served to weaken the tendency to make it a vague, romantic sentimentality and has contributed powerfully to its study as a historical growth. Thus the modern movement known as the higher criticism of the Bible was largely molded by Hegel's disciples. By applying the Hegelian idea of religion as a continuous development Vatke helped to transform our idea of the Old Testament into something historically coherent, and Strauss and Christian Baur worked in the same direction for the New Testament.

The incompatible elements in Hegel's philosophy led to a break up of his school into a right and a left wing. The orthodox, like Göschel, Gabler, Weisse and others, stressed the Christian-Prussian phase of Hegel—the glorification of the actual as the rational. But the young Hegelians, like Strauss and Bruno Bauer, stressed the atheistic and critical sides of Hegelianism and Feuerbach emphasized its realistic and positivistic aspects. At the same time the radicals, Ruge, Marx and Lassalle, argued that since the Prussian state was not rational it was not real and was bound to be destroyed. In a later phase of his development Marx adopted Hegel's dialectic method, according to which concepts necessarily generate their own opposites; but he transformed it through the speculative materialism of Feuerbach. In Marx' application of the dialectic method to history every economic system contains the seeds of its own destruction and eventually gives way to its opposite. To this day Marxists regard the dialectic method as an extremely important element in their system: Engels is one of the few men after 1860 to say a good word for the Hegelian philosophy of nature, nor would Lenin allow the slightest divergence from Marx' dialectic materialism.

In Great Britain the Hegelian philosophy was introduced first in Scotland by Ferrier, J. Hutchison Stirling, John and Edward Caird; then at Oxford by T. H. Green, W. Wallace, Bosanquet and Bradley; and later at Cambridge by McTaggart. It has since molded the whole of English philosophy. This may be due largely to the fact that it offered a *media via* to avoid the materialistic evolutionism of the Spencerians without

adopting the narrowly orthodox religious opposition to physical science. It was thus part of the liberal effort to save the values of the old order and yet take advantage of the new. In the hands, however, of Ritchie and others it became also a defense of political radicalism of a collectivist character as opposed to the individualistic or nihilist liberalism of Spencer.

In America the Hegelian philosophy was introduced by the German political refugees of 1848 and became influential, especially in the field of education, with William T. Harris at St. Louis, whose *Journal of Speculative Philosophy* was the first philosophic periodical in English. Harris followed Hegel in the classical conception of education as the liberation of power through the mastery of the cultural tradition of the race, and he strongly influenced in their youth men as diverse as John Dewey and Nicholas Murray Butler. In the last two decades of the nineteenth century C. C. Everett, Josiah Royce and others studied Hegel's philosophy in Germany and reenforced the Oxford tradition of Green, Bosanquet and Bradley; and today despite the reaction of pragmatism and realism idealists showing direct or indirect Hegelian influence are still perhaps the most numerous of American academic philosophers.

While there is a notable revival of the study of Hegel in Germany today, it has its greatest prestige in Italy. Introduced by Spaventa and Vera and applied to literature by F. de Sanctis, it was for a while eclipsed by positivism and the national Italian school. But Croce has brought it to the fore and Gentile has given it something of an official status.

HEGEL, KARL (1813-1901), German historian. Under the influence of his father, the philosopher, Karl Hegel first turned to the study of systematic theology. His association with C. F. Schlosser and Gervinus in Heidelberg led him to become interested in history and he devoted himself especially to the study of municipal history. In his *Geschichte der Städteverfassung von Italien seit der Zeit der römischen Herrschaft bis zum Ausgang des zwölften Jahrhunderts* (2 vols., Leipsic 1847) he refuted the views of Savigny and Eichhorn that the mediaeval municipal organization of the cities of Italy, France and southwestern Germany is to be traced directly to the Roman form and instead advanced the thesis that the organization of the Italian city republics rested upon a purely Germanic foundation with but a slight tinge of Roman tradition. In later years he took issue less successfully with the guild theory made prominent by Gierke in his *Deutsches Genossenschaftsrecht*. Confining himself strictly to the determination of the facts, he sought in his *Städte und Gilden der germanischen Völker im Mittelalter* (2 vols., Leipsic 1891) to show that there was no connection between the guild and the municipal organization.

In addition to his other general work on town history, *Die Entstehung des deutschen Städtewesens* (Leipsic 1898), Hegel is important for his supervision of the publication of *Die Chroniken der deutschen Städte* (continued by G. von Below and J. Hansen, 35 vols., Leipsic 1862-1929). He himself prepared the records for Nu-

remberg, Strasbourg, Mainz and Cologne and in the case of Nuremberg was the first to set a figure that was supported by source material for the population of a town in the Middle Ages. His work in this field has led to a correction of the previous exaggerated estimates of the population of mediaeval towns.

HERMANN AUBIN

Consult: Hegel, Karl, *Leben und Erinnerungen* (Leipsic 1900); Frensdorff, F., "Karl Hegel und die Geschichte des deutschen Städtewesens" in *Hansische Geschichtsblätter*, 1901 (Leipsic 1902) p. 139-60.

HEINE, HEINRICH (1797-1856), German poet and social philosopher. Heine was born at Düsseldorf, the son of an impecunious Jewish family. The forces which permeated him in his youth, laying the foundations for the social ideal of his maturity, were as dissonant as the diverse sides of his nature. The ideas of the French Revolution were revered by his mother, a highly cultured, rationalistically minded woman; they possessed in addition the sanctity of association with emancipation of the Jews during the Napoleonic regime in the Rhineland from 1806 to 1813. On the other hand, the inadequacy of the liberal panacea was already being foreshadowed in the Rhenish region, where the process of industrialization, far more rapid than elsewhere in Germany, was beginning to engender the ills of the proletariat. Another quite different force countervailing liberalism was the natural affinity of Heine's poetic temperament with German romanticism, with that very worship of the Middle Ages which politically signified reaction to a feudal ideal of society.

While Heine was rising to literary fame during the twenties as the author of the *Buch der Lieder* (1827) and the *Reisebilder* (3 vols., 1826-30), his political incompatibility with the romanticists, who in alliance with Metternich were a progressively pervasive and stifling force, became indubitable. In disgust with an alien atmosphere, barred from preferment by antisemitism, the *romantique*, now definitely *défroqué*, left Germany in 1831 for France, where he spent the rest of his life. From this period dates his emergence as a distinguished journalist and devastating satirist in revolt against feudal Germany. His championship of the German bourgeoisie against the reactionaries temporarily aligned him with the liberals, particularly Ludwig Börne. But there was a fundamental cleavage between their ideas, which became explicit after Heine had discovered in Saint-Simonism the

basis for a positive world view. On the political side Saint-Simonism attracted him by its reconciliation of democracy with the aristocracy of talent. Its renunciation of the liberal fallacy of natural rights and equality and its concentration upon erasing only the inequalities caused by the conditions of birth and the possession of capital squared with his realism; its projection of a society ruled by the ablest among the industrialists and scientists satisfied that romantic worship of the genius as leader of the masses which in his youth had bade him idolize Napoleon, the *menschgewordene Revolution*. To the liberals, however, his defense of the Saint-Simonian monarchy was incomprehensible in spite of his elaboration of his position in *Heinrich Heine über Ludwig Börne* (1840) and they laid his apostasy from their ranks to lack of character.

Heine perceived, unlike the liberals, that political and social change was only a means to cultural renovation. What interested him most intensely in Saint-Simonism was its delineation of a new religion. Fundamental harmony existed between the Saint-Simonian pantheistic socialism, with its emphasis on the value of life before death, and the joyous sensuousness of Heine, who in a typical work, *De l'Allemagne* (first published in *Revue des deux mondes* in 1834), conceived the whole process of western civilization as a struggle between the spirit obsessed Nazarenes (Jews and Christians) and the life worshipping Hellenes. The final goal of the world revolution was for him the "rehabilitation of matter . . . , its religious sanctification, its reconciliation with the spirit." It was his tragedy as a thinker that he surpassed the Saint-Simonians in realism and that in his later years he foresaw the historical task of the proletariat, by whose equalitarian tendencies, so uncongenial to him, would be destroyed not only the political forms of the *ancien régime*, which he abhorred, but its beauty, which the poet and Hellene loved.

G. RAS

Works: The two best editions of Heine's complete works are those by O. Walzel, 10 vols. (Leipzig 1910-15) and H. Friedemann and others, 15 vols. (Berlin 1908). An English translation by C. Leland and others has been published in 12 vols. (London 1891-1905). A good edition of Heine's correspondence is that by F. Hirth, 3 vols. (Munich 1914-20).

Berlin 1926); Walter, H., *Heinrich Heine* (London 1930); Lichtenberger, H., *Heinrich Heine, penseur* (Paris 1905); Wolff, M. J., *Heinrich Heine* (Munich 1922); Bieber, H., *Der Kampf um die Tradition, Epochen der deutschen Litteratur*, vol.

v (Stuttgart 1928), especially p. 109-26; *Heinrich Heine, Gespräche, Briefe, Tagebücher, Berichte seiner Zeitgenossen*, ed. by Hugo Bieber (Berlin 1926).

HEINECCIUS, JOHANN GOTTLIEB (1681-1741), German jurist. Heineccius studied theology at the University of Leipsic. Subsequently he studied law at Halle, where he was appointed professor of philosophy and later professor of law and where he came under the influence of the eminent jurist Samuel Stryk. Afterward he taught for a short time at Franeker in the Netherlands and was professor of philosophy at Frankfort on the Oder from 1727 until 1733, when he returned to Halle.

Heineccius was one of the important and influential jurists of the eighteenth century. His writings reflect his vast erudition, which reached far beyond the boundaries of ordinary learning; he had an expert knowledge of history and jurisprudence and his excellent training in philosophy gave him in addition a thorough command of scientific methodology. In the field of Roman law his leading works are *Antiquitatum romanarum jurisprudentiam illustrantium syntagma* (Halle 1719; 20th ed. by C. F. Mühlenbruch, Frankfort 1841) and *Elementa juris civilis secundum ordinem Institutionum* (Amsterdam 1725; 2nd ed. by C. G. Biener, Leipsic 1815), which became a standard textbook. Both were subsequently edited and commented upon by a number of distinguished scholars. Heineccius also published a third compendium entitled *Elementa juris civilis secundum ordinem Pandectarum* (2 vols., Amsterdam 1727; new ed. by C. G. Richter, Leipsic 1797). His *Ad legem juliam et papianam poppaeam commentarius* (Amsterdam 1726, new ed. Leipsic 1778) is still a valuable work.

His most important book on German law was *Elementa juris germanici* (2 vols., Halle 1735-36; new ed. Venice 1751), one of the first basic presentations of the evolution of German private law. In it he anticipated the significance of the nascent Germanic law, maintaining that it prevailed to a great extent in Germany and asserting that Roman law was not universal in its application. Yet he did not go so far as to discuss German law in terms of German concepts and was never able to free himself from Roman dogmatic thought.

HANS FEHR

Works: *Opera omnia*, ed. by J. C. G. Heineccius, 9 vols. (Geneva 1765-71).

Consult: Stintzing, R. von, and Landsberg, E., *Geschichte der deutschen Rechtswissenschaft*, 3 vols. (Munich 1880-1910) vol. iii, pt. i, p. 179-98.

HELD, ADOLF (1844–80), German economist. Held was the son of a distinguished professor of public law. Trained in economics by F. B. W. Hermann at Munich, he soon dissented from the teachings of his preceptor, considering them too deductive and Ricardian. His doctoral dissertation, *Careys Sozialwissenschaft und des Merkantilssystem* (Würzburg 1866), criticized Carey's views as forming a partial return to pre-Smithian economics. He was a student of Engel, the great Berlin statistician, upon whose recommendation he was appointed to a chair of economics at the agricultural college in Poppelsdorf in 1867 and at the University of Bonn in 1869. Under Engel's influence Held devoted himself unreservedly to the exploration of the new paths which a historical descriptive approach and emphasis on social policy seemed to open to German economists of the historical school. His elaborate inductive studies of taxation, an article in the *Zeitschrift für die gesamte Staatswissenschaft* (vol. xxiv, 1868, p. 421–95) and *Die Einkommensteuer* (Bonn 1872), warned against too abstract theorizing on tax incidence and against overestimating the income tax as the sole means of reaching the entire taxable capacity; in this sense these works anticipate important conclusions of modern fiscal theory and practise. After 1875 he worked on what was to become his magnum opus on the industrial revolution in England, the uncompleted version of which was edited posthumously by G. F. Knapp as *Zwei Bücher zur sozialen Geschichte Englands* (Leipsic 1881). The study is based throughout on original English material and opened a field for new inquiry in England itself. It is of permanent value as a source book on the industrial revolution in England.

Held was secretary of the newly founded Verein für Sozialpolitik, represented the National Liberal party in the columns of *Concordia* and on the platform and participated in the old Catholic opposition against the Vatican Council of 1870. He was generally liked because of his conciliatory nature; his decided criticism of Marxian socialism did not alienate from him the sympathies of socialists. Held died a year after he was called to a joint chair of economics at the University and the Agricultural College of Berlin.

CARL BRINKMANN

Consult: Wagner, Adolf, in *Allgemeine deutsche Biographie*, vol. xiii (Leipsic 1881) 494–98; Knapp, G. F., "Einführung in einige Hauptgebiete der Nationalökonomie" in *Ausgewählte Werke*, vols. i–iii (Munich 1925–27) vol. i, p. 350–62; Nasse, Erwin, in *Verein für Sozialpolitik, Schriften*, vol. xix (1880) i–xv, containing full bibliography of Held's writings; Ochen-

kowski, W. von, "Adolf Helds sozialpolitische Geschichte Englands" in *Schmollers Jahrbuch*, vol. vi (Leipsic 1882) p. 977–91.

HELFFERICH, JOHANN ALFONS RENATUS VON (1817–92), German economist. Helfferich, a student of Hermann and Nebenius, was professor of economics at various German universities. His main interest was in the field of monetary theory, and his *Von den periodischen Schwankungen im Werte der edlen Metalle von der Entdeckung Amerikas bis zum Jahre 1830* (Nuremberg 1843) is the most important contribution to that subject in Germany in the nineteenth century. In this work Helfferich attempted to disprove the opinion, widely held at the time, that the value of money is subject to wide short run fluctuations. He pointed to the high degree of elasticity in the demand and supply of precious metals and to the interlocal exchange operations as substantial factors in keeping the value of money fairly stable. His monetary theory, based on thorough historical research, was a synthesis of the cost of production theory with a modified quantity theory, which takes into account the subjective valuations of money as determined by the distribution of income. Of his later works "Die österreichische Valuta seit dem Jahre 1848" (in *Zeitschrift für die gesamte Staatswissenschaft*, vol. xi, 1855, p. 259–319, and vol. xii, 1856, p. 85–146, 403–60) is noteworthy for its excellent criticism of the irresolute policy of the Austrian bank of issue which led to the collapse of the currency in 1848. It is also valuable for its statistical and theoretical analysis in the spirit of Tooke of the foreign exchange fluctuations of a depreciated paper currency, which took account of the quantity of money, balance of payment and psychological factors. In this connection Helfferich examined for the first time the economic effects of monetary instability on debtor-creditor relations, which up to that time had been treated in German literature primarily from the legal point of view. Helfferich's other writings on price statistics, public finance, agriculture and forestry are of little importance.

M. PALYI

HELFFERICH, KARL (1872–1924), German economist, banker and statesman. Helfferich, who studied under Knapp and Lotz, began his

career as a writer on currency theory. He won early recognition by his two-volume work, *Die Reform des deutschen Geldwesens nach der Begründung des Deutschen Reiches* (Leipsic 1898), and in 1901 was appointed professor at the University of Berlin. In 1901 he entered the Foreign Office, where he devoted much attention to constitutional and currency reform in the German colonies; and in 1906 he joined the service of the Deutsche Bank, which sent him to Turkey to investigate the question of the Bagdad Railway. He concluded with Turkey the celebrated agreement of 1908 providing for the construction of the Bagdad Railway into Kurdistan as far as El Helif. An account of these experiences is to be found in his book on *Georg von Siemens, ein Lebensbild aus Deutschlands grosser Zeit* (3 vols., Berlin 1921-23), which is a valuable source book for the history of the Deutsche Bank—of which Siemens was the founder and most important director—and thereby of German banking in general. In 1915 Helfferich entered the cabinet as secretary of the federal Treasury and later became minister of the interior and vice chancellor. Like the financial leaders of most of the other warring nations Helfferich sought to avoid heavy taxation and to finance the war by borrowed funds; this led indirectly to an increase in the circulation of banknotes and thus undermined the German currency system even before the end of the war. As the most influential member of Bethmann Hollweg's cabinet Helfferich at first opposed the use of intensified U-boat warfare, but after the beginning of 1917 he actively supported the policy; this change of position, for which he was later frequently attacked, he sought to justify in his three-volume book, *Der Weltkrieg* (Berlin 1919).

In the course of his life Helfferich turned from liberalism to conservatism. While his *Handelspolitik* (Leipsic 1901) was a popularization of free trade doctrines, his *Deutschlands Volkswohlstand 1888-1913* (Berlin 1913, 5th ed. 1923; English translation New York 1914) presents an unduly favorable estimate of Germany's progress under William II. After the war Helfferich became leader of the *Deutschnationale Volkspartei*; in this capacity he was uncompromisingly opposed to the new republic, its institutions and its leading personalities.

Helfferich's scientific interest centered in the fields of monetary theory and history of monetary reform. The summary of his research is contained in *Das Geld* (Leipsic 1903, 6th enlarged ed. 1923; tr. by T. E. Gregory, 2 vols.,

London 1927). His theoretical position is essentially a justification of the gold standard. His view that the value of gold is relatively stable and that it is determined by manifold factors of demand as well as of supply represented the opinion most widely held in Germany before the World War; he characteristically disputed the connection between the rate of interest and the value of money. In practical currency policy he is credited by some with the invention of the *Rentenmark*; it is certain that the project of a *Roggenmark* was worked out by him in August, 1923. This proposal, to issue a paper currency whose value was to be "firmly" linked with the price of rye and which would thus assure to the German rye producer a fixed price for his product in *Landesgeld*, was rejected. In its place was adopted the *Rentenmark* based on *Rentenbriefe* (agricultural mortgage bonds), a device resorted to during the French Revolution. The stabilization of the mark, however, was due not to this technical adjustment but to the assurance of the limited issue of a new circulating medium.

HELPER, HINTON ROWAN (1829-1909), American publicist. Helper's book *The Impending Crisis* was an indictment of slavery from the point of view of a middle class southerner. It circulated widely and became an effective document in the Lincoln presidential campaign. On the basis of the census of 1850 Helper made a statistical comparison of the wealth, income and productivity of the north and south, showing that the former everywhere enjoyed an advantage, even in agriculture, the chief southern industry. He maintained that slave labor not only thwarted democratic institutions in the south but also impoverished that section by preventing the accumulation of capital and the development of a free white labor class. He regarded as the chief victims of the system the non-slave holding poor whites, disfranchised and forced into the sterile hills and plains by unsuccessful compe-

tition for land with wealthy planters; he urged them to organize politically, to levy a tax upon slave owning and to use the proceeds for the recolonization of the Negroes in Africa. In the south Helper was classed with Harriet Beecher Stowe despite the anti-Negro sentiments implied or stated in all his works. His interest was to free the south from what he regarded as an encumbrance, not to free the Negro. After serving in the Lincoln administration as consul at Buenos Aires he proposed the establishment of a railroad to connect the Americas from the Bering Sea to the Strait of Magellan, a project to promote which he expended a fortune.

HELVÉTIUS, CLAUDE ADRIEN (1715-71), French philosopher. A man of great wealth, a traveler well acquainted with England and Germany, the host of a famous salon, Helvétius held the posts of farmer general and *maître d'hôtel* to the queen until 1750, when he resigned in order to devote himself to philosophy. The only work which he published during his lifetime was *De l'esprit* (Paris 1758; tr. by W. Mudford, new ed. London 1810) but he left behind several others, among them *De l'homme*. Helvétius' writings represent the most extreme form attained by the sensationalistic and utilitarian philosophy in eighteenth century France. When *De l'esprit* appeared it was censured by the Sorbonne, the pope and the Parlement de Paris and in 1759 it was burned by the public executioner. Even Diderot found himself unable to subscribe to it. But in spite of Diderot's systematic refutation of the work and in spite of the fact that Helvétius never collaborated in the *Encyclopédie* the authorities held the sensationalistic philosophy expounded by the *encyclopédistes* responsible for Helvétius' dangerous principles. The appearance of *De l'esprit* was thus an important factor in the second suppression of the *Encyclopédie*.

According to Helvétius the content of consciousness, of which *De l'esprit* proposes to give

a complete analysis, is derived entirely from physical sensation. Since this sensation is the same in all men as well as in many animals, it follows that intellects are basically identical. The diversity in their manifestations or rather in the objects of their attention is also ultimately explained by physical sensation, which engenders passion, or the impulse driving men to seek pleasure and avoid pain. But the force which determines the direction of passion and so of the intellect is the judgment of society; for each individual is constrained by solicitude for his own comfort to live in harmony with his environment. Since the judgment of a particular society is dependent upon the interests of its members or of its ruling caste, the types of intellect will be as diverse as the sets of social conditions which evoke them. When the priestly class holds a position of authority, religious superstitions will be prevalent. Helvétius sees philosophy as the only avenue through which the individual may escape from the omnipotence of his environment to interests truly universal.

The relation between external conditions and the formation of intellect leads Helvétius to the subject of education. In *De l'homme, de ses facultés intellectuelles et de son éducation* (2 vols., London 1772; tr. by W. Hooper, new ed. London 1810) he attempts to show in opposition to Rousseau that formal instruction and particularly the system of reward and punishment used in such instruction are the supreme factors in the development of the intellect; or, in terms of his philosophy, in the development of the passions which produce the intellect. He concludes by declaring that all types of intellect, even genius, may be artificially created. By its very exaggeration of the importance of social factors in education Helvétius' work was a valuable corrective to the influence of Rousseau. Although the extremism which made his theories attract attention also doomed them for the most part to transiency, several of his ideas were taken over by P. J. G. Cabanis in *Rapports du physique et du moral de l'homme* (2 vols., Paris 1802; new ed., 1 vol., 1844).

RENÉ HUBERT

Works: *Oeuvres complètes*, 4 vols. (Liège 1774; new ed. by J. F. Saint-Lambert, 3 vols., Paris 1818). A collection of his *penées* and autobiographical notes has been edited by A. Keim as *Notes de la main d'Helvétius* (Paris 1907).

HENCKEL, GUIDO, FÜRST VON DONNERS-MARCK (1830-1916), German industrialist. Prince Guido was a member of a wealthy family of merchants, bankers and landowners which had been prominent in the economic life of the country since the sixteenth century. Beginning with the exploitation of his family's vast mining properties in Upper Silesia Prince Guido built up one of the most powerful business concerns in pre-war Germany, with interests extending to many foreign countries. By establishing pig iron works in Stettin, Lübeck, Emden and Bremen he was the first to meet successfully the competition of English iron in the coast provinces of the North Sea. Later he acquired ironworks in the Rhineland and iron mines in Sweden. Utilization of by-products of coal and iron brought him into close touch with the chemical industry. Eventually he controlled enterprises producing potash, cellulose, paper, rayon and building materials and had large interests in real estate and banks. In the variety of its organically unrelated interests Prince Guido's concern was in marked contrast to the horizontal trend characteristic of German combinations prior to 1918 and in some ways resembled the post-war Stinnes concern. Unlike the latter, however, it was not the product of abnormal inflationary conditions but rather the creation of a restless and versatile entrepreneur commanding a large capital and seeking an ever wider field of activity. The concern and the private fortune of Prince Guido, the value of which was estimated at approximately 300,000,000 marks in 1914, did not survive the master. The enterprises in Upper Silesia, the original nucleus of the organization, suffered greatly from the paralysis of business resulting from the cession of that province to Poland.

HENDERSON, CHARLES RICHMOND (1848-1915), American social worker. After twenty years as a Baptist clergyman Henderson joined the faculty of the new University of Chicago, dividing his time between the department of sociology, the divinity school and a host of civic organizations. Although nominally a sociologist his contributions were to social ethics and social reform. Influenced by Brockway he became a leader in the prison reform movement, finding recognition as president of the International Prison Congress in 1910. He accepted conventional charity organization principles but was also interested in public relief systems. His greatest interest lay in the field which he called social politics, dealing with problems of industrial accidents, occupational diseases, unemployment and industrial disputes. In his last book he favored a transition from philanthropy and welfare schemes to social legislation, but he was not sanguine concerning the prospects of industrial democracy. He was less an originator than a compiler and promoter, but he was a man of wide influence.

STUART A. QUEEN

Important works: *Introduction to the Study of the Dependent, Defective and Delinquent Classes* (Boston 1893, 2nd ed. 1901); *Social Elements, Institutions, Character, Progress* (New York 1898); *Modern Methods of Charity* (New York 1904); *Die Arbeiter-Versicherung in den Vereinigten Staaten* (Berlin 1907), revised and tr. as *Industrial Insurance in the United States* (Chicago 1909); *Correction and Prevention*, 4 vols. (New York 1910); *Social Programmes in the West* (Chicago 1913); *Citizens in Industry* (New York 1915).

HENLEY, WALTER OF (thirteenth century, exact dates of birth and death unknown), English agriculturist. Walter of Henley wrote *Le dite de husebondrie* in the Anglicized Norman French dialect of the first half of the thirteenth century. Nothing certain is known of him except that he was, as he says himself, a bailiff in charge of a landed estate. A manuscript written in the reign of Edward III gives details for which no authority has yet been discovered. It styles him "Sire Waltier de Hengleve" and adds that he became a "chivalier" and ultimately a "frere precheur." In other words he became a man-at-arms, if not a knight, and joined the Dominican order. The work is valuable to us for the light which it throws on rural employments in the reign of Henry III. It is a practical treatise by a practical man on operations of farming, management of livestock, the return of given quantities of seed.

the yield of dairy cattle and poultry and means of checking leakages and frauds by employees. Twenty-one manuscripts known to be extant attest its wide circulation. It was translated into English, Welsh, French and Latin and was plundered without acknowledgments by the anonymous compiler of *Fleta*. An English version published by Wynkyn de Worde is among the earliest printed books. Fitzherbert, whose *Boke of Husbandry* finally superseded it in 1523, appropriated from it large and unacknowledged extracts. It even survived into the seventeenth century: Gervase Markham quotes its distinction between the effects of marl and manure on the soil in his *Inrichment of the Weald of Kent* (London 1625). It lived because, however land was held, its experienced advice continued useful to agriculturists; whereas its three contemporaries, the two anonymous treatises *Hosebonderie* and *Seneschaucie* and *Les règles seynt Roberd* of Bishop Grosseteste, which were concerned mainly with manorial organization, failed to survive the substitution of money rents and wages for labor services. Walter of Henley's *Husbandry* has been admirably edited and translated with transcripts and glossary by Elizabeth Lamond (London 1890).

ERNLE

Consult: Cunningham, W., Introduction to Lamond edition of *Husbandry*, and Royal Historical Society, *Transactions*, n.s., vol. ix (1895) 215-21.

HENRY II (1133-89), king of England, 1154-89. Henry founded his government upon those of his grandfather, Henry I of England, and his father, Geoffrey, count of Anjou. He was distinguished equally for his use of the best methods of his predecessors and for his own wise innovations. The common law of England—common to all the country and with trifling exceptions to all men above serfs—was founded in his reign. Itinerant justices dispensed a uniform justice over the land, and the royal courts whether central or local were opened to an increasing amount of litigation. Henry made the sworn inquest, which had been brought to England at the time of the Conquest, a regular part of court procedure and developed it along new lines. A jury was introduced for the purpose of indicting suspected criminals, thus recognizing that crime was a concern of the state and not solely a matter for private prosecution. In the most important civil suits the tenant could honorably place himself on a trial jury and avoid trial by battle; while by the possessory assizes,

which became immensely popular and spread the use of the jury into new actions, the principle was laid down that no one could interfere with possession except on the basis of a court judgment. Henry also distrusted the ordeal and took the first step toward a traverse jury. In 1178 in appointing justices to sit at Westminster he ordained a permanent central court, long known simply as the Bench, to which can probably be traced the origin of the court of common pleas. The Exchequer was becoming a court of law in debt cases and reached such high development as a treasury department that it inspired the famous *Dialogus de Scaccario*, while the new law and procedure of the royal courts led to the writing late in the reign of the first great English law book, the *Tractatus de legibus et consuetudinibus regni Anglie* ascribed to Glanvill, Henry's chief justiciar. Henry struggled with partial success against the advancing claims of the church courts championed by Becket.

Although a man of war both in France and against his rebellious sons, Henry was a peace king, his measures making a more permanent contribution to civilized and ordered society than those of any other English sovereign. He ruled over more than half of France, but his reforms scarcely penetrated beyond Normandy and Anjou and even in those provinces lasted only a short time after his death.

ALBERT BEEBE WHITE

Consult: Salzman, L. F., *Henry II* (Boston 1914); Norgate, Kate, *England under the Angevin Kings*, 2 vols. (London 1887) vol. i, chs. viii-xi, vol. ii, chs. i-vi; Morris, W. HENRY IV (1050-1106), Holy Roman emperor from 1056. Upon the termination of the regency in 1065 Henry launched a counter movement against the alienation of royal property and privileges which had taken place, especially in the Harz region, during his minority. The reaction, inevitable but overhasty, incited the great Saxon rebellion. After he had suppressed this he entered upon his prolonged conflict with the papacy. The so-called investiture conflict (*q.v.*) arose from the efforts of the church under the leadership of Gregory VII (*q.v.*) and later popes,

particularly Urban II, to put an end to the investiture of ecclesiastics by members of the laity. Henry valued the traditional royal privilege of investing bishops because the German ecclesiastics also fulfilled important temporal functions in the imperial government. His spectacular humiliation at Canossa in 1077 after the German princes had rallied to Gregory's support was the first of many not altogether undeserved reverses. But he maintained his position until his death with such tenacity that his son, Henry V, was able to carry on the struggle.

In social and political history Henry is notable as the first to seek support for the kingship against the temporal and spiritual princes in the lower strata of the population. When the bourgeoisie of the Rhenish cities revolted against their bishop-princes he gave them assistance: he entrusted important administrative functions to the class of imperial officials which had risen from serfdom to knighthood. It was left to his successors to reap the profit of such innovations, since neither of these classes was sufficiently strong in Henry's time to help him defeat the feudal lords. The legislation of his last years had a dominantly social purpose. By the general peace of Mainz in 1103 he forbade the nobility to engage in warfare not merely on certain days or occasions, as the earlier "peaces of God" had provided, but for a continuous period of four years. In the field of criminal law he was the first to establish equal corporal and capital punishment for freemen and bondsmen in offenses ranging from breach of peace to serious crimes; this work initiated the long process of incorporating the lower classes into constitutional life. His downfall in the last year of his life was finally precipitated by his attempt to protect the peaceful industry of townsmen and farmers against the encroachments of the nobility. Although his interference was repaid by a revolt of the nobles under the leadership of his son, which led to his deposition, it assured him the sorrowful reverence of the people.

Meyer von Knonau, 7 vols. (Leipzig 1890-1909).

HENRY IV (1553-1610), king of France. Proclaimed king of Navarre in 1572, Henry became king of France in 1589, although he was not universally recognized until five years later after his conversion and the capture of Paris. During the twelve years of his actual administration, following the final consolidation of his position in 1598, he devoted himself to the task of repairing the devastations which France had suffered during the preceding decades of civil war and invasion. Working in close contact with his friend the duke of Sully (*q.v.*), whom in 1597 he had appointed superintendent of finances, Henry carried forward a program of internal improvements, which included the rebuilding of roads, dredging of rivers, building of canals and draining of swamps. He was deeply influenced by Sully's agrarianism but manifested at the same time an active interest in the industrial program of his retainer Barthélemy de Laffemas (*q.v.*). By his general support of new manufactures as well as by his encouragement of maritime commerce and colonial activity in America Henry anticipated the mercantilist doctrines as elaborated and refined by Richelieu and Colbert. His skill as a political administrator combined with his Gascon jocularly and a judicious use of money enabled him to reestablish order throughout France and to introduce a period of peace, notably in the religious world. At first a Huguenot, afterward a convert to Catholicism and even a protector of the Jesuits, he promulgated the far reaching Edict of Nantes of 1598, which ushered in liberty of conscience and within certain limits liberty of worship, civil equality and guaranties of security. Equally active in the conduct of foreign affairs, he imposed on Spain after years of warfare the peace of Vervins; reconciled the papacy and the republic of Venice; and as a protection to Geneva advanced the frontiers of Burgundy at the expense of the duke of Savoy. He was the ally of Elizabeth and James VI of Scotland, friendly with the United Provinces and the German Protestant princes and was preparing at the time of his assassination the resumption of the struggle against the house of Austria. Essentially a realist in spirit and in policy, Henry was far from nourishing the dream of a European republic such as Sully was to impute to him.

HENRY VII (1456-1509), king of England, 1485-1509. Henry's right to the throne and his position as founder of the Tudor dynasty rested on his mother's claims, on the fortunes of war, on his acceptance by Parliament, on his subsequent marriage with Elizabeth, representative of the rival royal house of York, and on his success in bringing about the imprisonment or execution of all pretenders to a better right than his own. It was not, however, until his reign was more than half over that complete recognition of his right to reign was everywhere accepted and the house of Tudor fully established. Henry was also founder of a new dynasty in the sense of establishing the unquestioned supremacy of the king over Parliament and over the nobility. Parliaments were called less frequently than they had been for the preceding century and a half and when they met were more submissive to the king's bidding. The power of the nobles, already diminished by the losses of the Wars of the Roses, was further weakened by laws forbidding noblemen and gentlemen to grant liveries to followers and dependents not actually in their employ as well as by a reorganization and strengthening of centralized criminal jurisdiction exercised by the King's Council meeting regularly in the Star Chamber. Responsive to the interest in exploration and commerce characteristic of his time, Henry signed commissions authorizing the expeditions of the Cabots and later explorers and acknowledged their discoveries in America by the grant of petty rewards. He negotiated favorable commercial treaties with Denmark, Burgundy and Florence and encouraged the Merchant Adventurers and other English merchants by the grant of charters and by following a nationalist policy in treaties and in trade legislation. Henry's financial policy was skilful and successful; he balanced his income and expenditures and bequeathed to his successor a full treasury. This was done, however, through rigorous measures of taxation and enforced loans, which decreased his own popularity and enraged the people against his financial ministers. At his death the new dynasty was established, the country at peace and orderly, finances were satisfactory, the commercial classes prosperous and trade expanding. Except for the turmoil due to agricultural enclosures conditions in the country

might be considered to have justified Henry's policy as king.

HENRY VIII (1491-1547), king of England (1509-47). In the personal position of the sovereign and the extent of his authority English kingship probably reached its highest point in Henry VIII. Unlike the six sovereigns who had immediately preceded him and many who succeeded, he was secure in his claim to the throne, inheriting through his father and his mother respectively the rights of the lines of Lancaster and York. His security of position was reflected in his policy. The ministers and nobles who fell from office—or who were executed or banished—were those who opposed his policy or failed to carry out his wishes, not those who threatened his security. The only serious internal opposition he had to meet during his long reign was a temporary rising of the nobles, clergy and people of the northern shires against his religious policy. The most striking instance of his unparalleled authority was the success of Henry and of Wolsey (*q.v.*) in separating the English church from the papacy, although the same prestige is indicated by his use of proclamations with the force of law, his settlement of the succession, his irregular taxation and his dissolution of the monasteries and other corporations.

In all of these cases he was able, thanks to the new technique of parliamentary manipulation evolved by Thomas Cromwell (*q.v.*), to proceed through the regular channels of parliamentary legislation. Despite the autocratic character of his government he called Parliament frequently, created no standing army, exercised little censorship over the press and had no bodyguard. His strength was due not only to his secure position, long reign and despotic temperament but to the general coincidence of his ideas with those of the most influential classes of his people and with the tendencies of the time. In England as in other countries of Europe order was more desired in that period than liberty. His enthusiasm for naval expansion and exploration en-

deared him to the commercial and other economic interests which looked to the monarchy for encouragement.

As a youth he was the idol of the people, handsome, vigorous, mentally alert, well educated and singularly persistent in whatever he undertook. His literary and legal opposition to Lutheranism was followed by the long dispute with Rome arising from the divorce question—a dispute which brought England so near to the faith which her king had earlier opposed. During the earlier part of his reign he frequently intervened in continental alliances, but his later years were characterized in general by a rigid isolation. By his will, authorized by Parliament, he established the succession of his three children, Edward, Mary and Elizabeth; but his provision after them for the descendants of his younger sister was reversed in favor of the descendants of his older sister, the kings of the house of Stuart.

HENRY OF LANGENSTEIN (1325–97), German mathematician, astronomer, theologian and jurist. He was born near Langenstein in Hesse. For many years he occupied the position of professor of philosophy and theology in the University of Paris. In the controversy arising out of the western schism he supported the cause of Pope Urban VI and advocated the assembly of a general council. Rather than acknowledge the antipope Clement VII he left Paris and settled at Wiesbaden, whence he was summoned in 1384 by Albert III, duke of Austria, to assist in founding the faculty of theology in Vienna University. He spent the remainder of his life in Vienna teaching and writing on theology and canon law.

Henry of Langenstein was one of the most learned men of his age. Possibly his most important work was the *Tractatus de contractibus* (published with the works of Gerson, Cologne 1483, vol. iv, fols. 185–253), for which he was regarded by later writers as a high authority on contracts. This treatise throws much light upon the attitude of the later mediaeval canonists toward economic matters. The duty of labor is strongly emphasized, and disapproval is expressed of living on rents except in the case of persons engaged in the service of the church or state or in the case of the aged. Every commodity is

stated to possess a just price at which it must be sold. The principal rule for determining the just price is that it must be sufficient to maintain the seller in the status to which he belongs; any attempt to raise one's status by charging higher prices is sinful. Usury and speculation are strongly condemned. He would extend the prohibition of usury to apply also to Jews but urged that the latter be allowed to engage in crafts, trade and agriculture.

HENRY THE NAVIGATOR (1394–1460), Portuguese explorer and empire builder. Henry was the son of John I of Portugal, whom he persuaded to undertake the conquest of Ceuta. Its fall in 1415 gave the first impulse to Portuguese expansion. Shortly afterward Henry withdrew to the promontory of Sagres, the southernmost point of Portugal, where he founded a community for nautical and astronomical studies, called Villa do Infante, consisting of his protégés and foreign technicians including Jacome de Maiorca, Cadmosto and Noli. The group began by collecting information on Morocco and studying the books and maps acquired by Henry's brother Dom Pedro, the celebrated traveler and scholar. Through their research Henry and his associates created the science of navigation, which until then had been a subject of superstitious speculation and terror.

At his instigation voyages of exploration were made to Porto Santo, Madeira, the Azores, Cape Verde and down the west coast of Africa to the fifteenth parallel. Successful colonies were planted in the newly discovered territories by methods which form the basis of the modern science of colonization. Henry fostered the Portuguese trade with Africa, developed the traffic in slaves and introduced into Madeira the cultivation of sugar, which became a great source of wealth. Through his efforts Portugal began to be transformed from a small agricultural country to a great colonial power which for a time was to lead the world in discovery and exploration. His ultimate object was to find the sea route to India with a view to restoring to the Portuguese the oriental commerce in spices and discovering the legendary kingdom of Prester John. His persistence in his search gave a tre-

mendous impetus to European exploration and directed it along two main lines: around the Cape to the East Indies and across the Atlantic toward the West Indies.

HERBART, JOHANN FRIEDRICH (1776-1841), German educator. Herbart was early acquainted with the philosophies of Wolff and Kant and began to study under Fichte in 1794 but soon developed antagonistic ideas. As a private tutor in Berne in 1797 he established connections with Pestalozzi. In 1802 he became lecturer at the University of Göttingen and in 1809 professor in Königsberg, succeeding Kant. Here he founded a pedagogical seminary with a model school which served as a place for experiment and research and as a training ground for high school teachers. In 1833 he returned to Göttingen, where four years later he was abandoned by his students when he took no part in the protest by a group of Göttingen professors against the king's violation of the constitution.

Herbart saw the purpose of education as "virtue." The means he saw as "government," which produces an exterior order and averts evil; as "discipline," which aims at winning the will of the child for virtue and at ennobling that will; and above all as "instruction," which by systematic cultivation of ideas leads the pupil to acquire a moral personality. Instruction takes place in four steps: isolating the individual concept ("clearness"), connecting it with related concepts ("association"), arranging these in a system of relationships ("system") and perfecting the relationships ("method"). A harmonious development of all forces is obtained through a balanced variety of interests.

This conception of the power of pedagogy and the importance of training was rooted in Herbart's system of psychology. The soul is something "real," without extension, unchangeable, independent and without faculties (*Seelenvermögen*). Man becomes an active thinking being only through the contact of the soul with the reality of the body. Ideas fill the consciousness, obscure and displace each other or blend according to the laws of mental mechanics. Sensa-

tions are the realizations of tension in the mind. Desire (will) is an inhibited idea, which, however, remains alive. Under the term idea Herbart conceived more than merely a product of the intelligence, but his doctrine has been understood to mean that organizing the pupil's ideas and knowledge would lead him to virtue and education. This notion has continued to influence education even up to the present, especially through Drobisch, Strümpell, Hartenstein, Waitz, Mager and Ziller's "five form" school. Herbart's ideas were in fact the bases of the chief German pedagogical school of the late nineteenth century and exerted considerable influence in the United States through pedagogues trained at Jena. The Herbartians (for example, Stoy and Rein) had their last center in the Jena pedagogical seminary until the postrevolutionary school reforms terminated their declining influence.

HERBERT OF CHERBURY, FIRST LORD, EDWARD HERBERT (1583-1648), English philosopher. Herbert was famous as a traveler, soldier and diplomat before he achieved distinction as a philosopher and litterateur. Although he was the brother of George Herbert, his character differed singularly from that of the poet-priest. During the reign of the first two Stuarts he traveled abroad, fought in various campaigns and was English ambassador at Paris from 1619 to 1621 and from 1622 to 1624. In the difficult period of the English civil war he endeavored

not without success to maintain neutrality, with the result that on the capture of his castle of Montgomery his library was saved and he received a pension from the parliamentary party.

Herbert wrote *The Life and Reign of King Henry the Eighth* (London 1649; reprinted 1880) eulogizing that monarch, several poems and an autobiography (ed. by Horace Walpole, London 1764; new ed. by S. Lee, 1906) reciting the gallantries of his travels and fights; but his final claim to fame depends upon his philosophical works. Of these *De veritate* (Paris 1624, 3rd ed. London 1645), *De causis errorum* (London 1645) and the posthumous *De religione gentilium* (Amsterdam 1663, 2nd ed. 1700; tr. by W. Lewis, London 1705) are essential for an understanding of his ideas. Further statement of his religious beliefs is found in his *De religione laici* (London 1645), of which *De causis errorum* is a defense, and *Ad sacerdotes de religione laici* (London 1645). In *De veritate* he elaborates his theory that innate faculties for perceiving truth exist in man; that these faculties may be divided into four principal classes, natural instinct, sensation, conscience and reason, each corresponding to a kind or degree of truth; and that they receive the stimulus for active functioning from contact with objects. His religious doctrine assumes that all religions, pagan as well as Christian, rest upon five notions innate in man: the existence of God, the duty of worshipping Him, the necessity of human piety and virtue, that of repentance for sin, and belief in future reward and punishment. Although conceding that Christianity because of its essential conformity with these five articles is the highest form of religion, Herbert rejects revelation as the invention of priests and maintains that the practise of virtue, apart from profession of orthodox theological opinions, is sufficient to lead to eternal happiness. Such theories were naturally unpopular in the dogmatic seventeenth century, and Herbert's religious ideas failed to receive sympathetic criticism until their consideration by Locke. In the eighteenth century his name came to be associated with the English deist movement. While certain elements in his thinking, such as his insistence upon the ubiquity of natural religion and his distrust of revelation, justify the association, his position suggests correspondence also with the Cambridge Platonists of his own century. Among foreign thinkers Gassendi and Descartes read and commented upon Herbert.

HERCULANO DE CARVALHO E ARAUJO, ALEXANDRE (1810-77), Portuguese historian. Herculano was largely self-educated and in his youth became interested in German literature and history, an interest which definitely influenced his intellectual development. In 1831 he was forced to emigrate because of his liberal political views. After his return he became librarian at the municipal library of Oporto and subsequently at the Royal Library of Ajuda at Lisbon.

Herculano introduced the spirit of scientific criticism into the writing of Portuguese history and was the founder of modern historiography in his country. Between 1846 and 1853 he published his *Historia de Portugal* (4 vols., Lisbon), a work which revised in a fundamental fashion all former political, diplomatic and social histories of Portugal. The *Historia*, which went to 1279, the end of the reign of Affonso III, was particularly valuable for the light it shed on the early history of the country and it soon became a classic. Herculano was also the author of *Historia da origem e do estabelecimento da inquisição em Portugal* (3 vols., Lisbon 1854-59; tr. by J. C. Branner, Stanford University 1926), a vivid account of the Inquisition and of the diplomatic drama which preceded its introduction into Portugal. It was definitely anti-Catholic in sentiment and aroused a great deal of controversy. Both works show a thorough mastery of documentary material. Another great contribution to Portuguese history was the volumes of *Portugaliae monumenta historica*, documentary material on the early history of Portugal, which Herculano edited under the auspices of the Academia das Sciencias (7 vols., Lisbon 1856-88). Despite the fact that his scientific treatment of historical material excited opposition Herculano had a profound influence upon historiography, not only in Portugal but in Spain and Brazil as well.

Herculano was also an outstanding figure in the movement for the political "regeneration" of Portugal. His review *Panorama* furthered popular education and modified literary taste. His literary productions reflected the trend of German romanticism and helped to popularize it in Portugal. The three volumes of his *O Monasticon* (vol. i, *Eurico o presbytero*, Lisbon 1844, 7th ed.

1876, French translation Paris 1888; vols. ii, iii, *O monge de Cister*, Lisbon 1844, 3rd ed. 1869) and *O bobo* (Lisbon 1851, 12th ed. 1884), his best known historical novels, are models of Portuguese prose and combine romanticism with the scientific objectivity of the historian

HERDER, JOHANN GOTTFRIED VON (1744-1803), German historian, litterateur and social philosopher. Herder studied theology at Königsberg and was strongly influenced by Kant, Rousseau, Winckelmann and Hamann. With Hamann, Herder was the father of the *Sturm und Drang* movement. He supplied it with a literary program in his *Über die neuere deutsche Literatur* (Riga 1767, 2nd ed. 1768) and in articles on Shakespeare and Ossian and he exercised a profound influence on the early development of Goethe. The ideas of the Enlightenment influenced him to an increasing degree in his later works, especially in his *Ideen zur Philosophie der Geschichte der Menschheit* (4 vols., Riga 1784-91; tr. by T. O. Churchill, 2 vols., 2nd ed. London 1803) and in the *Briefe zur Beförderung der Humanität* (10 vols., Riga 1793-97). At the close of his life he became involved in controversies with Kant over the meaning of history and the nature of knowledge.

Herder was one of the most potent forces in German intellectual history and gave a new direction to the development of German poetry, aesthetics, pedagogy, theology, linguistics, psychology, history and cultural anthropology. His importance springs chiefly from the fact that he was the originator of the "historical sense" in Germany. He elaborated the idea that scientific investigation should not proceed according to abstract principles but should attempt to arrive at a sympathetic understanding of life in its manifold aspect. Events and personalities should be considered in the light of their historical setting. History is something irrational, divine, a superpersonal whole in which the individual is inextricably interwoven. Standing between Vico and the romantic movement he was the first to

apply Leibnitz' concept of development to the treatment of the history of peoples. Every civilization, he maintained, buds, flowers and fades according to natural laws of growth. The various periods of civilization are all perfect in their own way and hence it is as foolish to condemn any epoch as to long for its return. These ideas are developed in Herder's early work, *Auch eine Philosophie der Geschichte zur Bildung der Menschheit* (Riga 1774), which is also significant as one of the first sympathetic treatments of the Middle Ages.

In his *Ideen* Herder introduced certain normative principles that mar this sublime conception of history. The idea of "humanity," developed by Shaftesbury, comes to occupy a central position. All heroes of history, all institutions and empires, are measured by this ethical idea, which in a somewhat vague manner embraces education, reason, humaneness and goodness. The whole development of mankind is directed toward humanity as a goal, and even nature by virtue of the divine harmony of the cosmos paves the way for this unfolding of human reason. Thus Herder gave new force to the idea of progress as taught by the historians of the Enlightenment. The human race is a great unit in which the nations should dwell together harmoniously and combine "for the cultivation of humanity." He emphasized, however, the concept of national individuality and maintained that peoples differ from one another in respect to climatic conditions, blood mixture and folk spirit. From this individual folk spirit all cultural expressions such as law, state, economic organization, poetry and religion must take their rise. Every imitation, every transplanting of political institutions or spiritual goods, is organically limited by this national character.

Herder is in many respects the last synthetic thinker of the eighteenth century. Like Rousseau he often fails to probe to its very depths the problem of origins and thus fails to realize his own program of "genetic thinking." At the same time he is a herald of the most important sociological concepts of romanticism. Before the brothers Schlegel and Grimm he set forth the idea of folk art in his *Stimmen der Völker in Liedern* (2 vols., Leipsic 1778-79); before Karl Ritter he taught the uniform development of man by nature and history and created scientific geography; Savigny derived from him the idea of the organic national group; Görres found in his writings the basis for his political philosophy of nationalism; and both Hegel and Ranke

learned from him the "religion of becoming." His *Ideen*, translated into French in 1825, exercised an enormous influence on the French romanticists, especially Quinet, Guizot and Michelet, and likewise had a lasting influence on the growth of a national sentiment among the Slavs.

HEREDITY. The concept of heredity arose from the fact that resemblances between closely related individuals are on the average greater than between individuals more distantly related. Not only similarities, however, but differences as well may be produced by heredity; only in pure races does like necessarily produce like; individuals of mixed ancestry transmit different elements to different offspring. On the other hand, similarities may be due not only to heredity but to environment; and since closely related individuals are generally subjected to similar environments, environmental and hereditary effects are often difficult to disentangle.

The notion of hereditary similarities must be limited to those brought about by the actual transmission of something from parent to offspring, excluding the transmission of property and also the passing on of traditions or rather their recreation in each generation. We must exclude also the transmission of chemical substances and disease germs through the mother's milk or their passage from the mother to the unborn child in her womb, for from the biological point of view these influences are not hereditary but are part of the child's environment.

An individual's heredity is fixed at the time of his conception. Before the invention of the microscope the nature of conception or fertilization was unknown. Microscopic study has shown that the body is composed of minute units, the cells. These are of different types—muscle cells, nerve cells, reproductive cells and the like. The reproductive cells of the two sexes are different; those of the female, the egg cells, are relatively large, spherical in shape and non-motile; those of the male, the sperm cells, are much smaller, elongated in shape and motile. In the fertilization process the sperm penetrates the egg and a single cell, the fertilized egg, results. This divides into two parts, each of these then divides into two, and by a continuation of this process all the cells of the body are formed. Some cells continue to divide throughout life; in the skin, for example, new cells are always forming. Other cells, such as those of the brain, cease to divide after a certain age.

Although the egg is very minute and the sperm even more so, only a part of each is hereditary material in a strict sense. Both cells contain a definite number of bodies, usually rod shaped, called chromosomes; in the human race there are twenty-four chromosomes in the egg and the same number in the sperm. There is a one to one correspondence between the chromosomes of egg and sperm, each chromosome of one resembling in size and shape a chromosome of the other. The fact that the chromosomes are equal in number in egg and sperm while the rest of the cell, the cytoplasm, is much greater in the egg suggests that only the chromosomes are vehicles of heredity; for an individual inherits on the average about equally from both parents.

After the sperm penetrates the egg in fertilization, the resultant cell has two sets of chromosomes, or forty-eight in all. At each cell division every chromosome splits lengthwise, half going to each new cell; thus every cell has two complete sets of chromosomes. But when the reproductive cells are formed, a different type of division occurs. The chromosomes do not split; instead each chromosome derived from the mother lies alongside the corresponding chromosome derived from the father and the two separate, one going to each new cell. Thus every egg or sperm has only one set of chromosomes (twenty-four). When a sperm enters an egg in fertilization, the double number, forty-eight, is restored; in this manner there is maintained an alternation of twenty-four chromosomes in the

reproductive cells and forty-eight in the other (somatic) cells.

The chromosomes, minute as they are, are not the ultimate units of heredity; they contain still smaller units, the genes, of which there are probably several thousand in a cell. The genes have not been distinguished even with the highest powers of the microscope; they can scarcely be much larger than large organic molecules. Their behavior shows that within each chromosome they are arranged in linear fashion like beads on a string. All the genes of an egg differ from one another, and the same is true of the genes of the sperm. But for each gene in the egg there is a corresponding gene in the sperm and conversely. Corresponding genes, known as allelomorphs, are located in corresponding positions in corresponding chromosomes. If the two allelomorphic genes are identical, the individual is said to be pure, or homozygous; if they are not identical, the individual is said to be hybrid, or heterozygous. An individual may be pure for some genes and hybrid for others; it is likely that this is the situation in most human beings.

When a chromosome divides, every gene in it divides; hence the somatic cells derived from a fertilized egg are precisely alike in the genes they contain. Since each gene is thus multiplied many fold, it must grow by taking substances from the cytoplasm and building them up into its own material. The genes, which are in fact chemical substances, although their composition is unknown, interact with the rest of the cell; as a result of the interaction the traits of the individual are produced. Each gene affects many traits; for example, in man alteration of a single gene has brought about brachydactyly, the lack of one of the bones in each finger accompanied by a general stunting of the entire body. Conversely, every trait may be affected by many genes; for example, the difference in skin color between Negroes and whites is probably due to a difference in at least three pairs of genes. In species which have been studied more intensively it has been shown that a character may depend on over a hundred genes.

When several pairs of genes influence the same trait, the effect of each depends on the others. The effect of a gene depends also on its allelomorph. An individual which is hybrid for a pair of genes is in some cases intermediate between the two pure races; in other cases the hybrid resembles one of the races more closely—sometimes so closely as to be indistinguishable from it. In the last mentioned case the gene whose

effect is noticeable is called dominant; the gene whose effect is hidden is called recessive. Whether or not two allelomorphic genes exhibit the relation of dominance and recessiveness or produce an intermediate hybrid depends partly on their nature, partly on the influence of the other genes and of the external environment.

In the formation of eggs or sperm the separation of each chromosome from the corresponding one brings about the separation of each gene from its allelomorph; hence every egg or sperm contains only one gene of each pair. If an individual is pure for every pair of genes, all the germ cells will be alike, since it makes no difference which gene of a pair any germ cell receives; such an individual will transmit identical inheritances to all his children. But if an individual is hybrid for one or more pairs of genes, the germ cells and hence the offspring will differ according to which genes they receive. Thus as a result of segregation some genes of each parent will be entirely unrepresented in the offspring—a fact which explains why heredity is not synonymous with ancestry.

The number of different kinds of germ cells and hence of offspring depends on the number of genes for which an individual is hybrid. If there is one such pair, A and a , there will be two types of germ cells, A and a . If in addition the individual is hybrid for a pair of genes in another pair of chromosomes, K and k , there will be four types of germ cells in equal numbers: AK , ak , Ak and aK . For when segregation occurs it may happen that the chromosomes carrying A and K go to one cell and the chromosomes carrying a and k go to the other; or, since each chromosome pair segregates independently of the others, it is equally likely that A and k will go to one cell and a and K to the other. If the individual is hybrid also for a pair of genes in a third pair of chromosomes, Q and q , there will be eight types of germ cells in equal numbers, since each of the four classes of the previous case will be subdivided into two groups of which one receives Q , the other q . In general in an individual hybrid for n pairs of genes in different pairs of chromosomes, the possible number of classes is 2^n . In a human being hybrid for a pair of genes in each pair of chromosomes the number of possible kinds of germ cells would be 2^{24} , or 16,777,216. 14.11.51.

When one parent is hybrid and the other pure, the inherited differences among the offspring are due to segregation in the hybrid parent; hence the classes of offspring occur in the same

relative numbers as the classes of germ cells of the hybrid parent. The results are more complicated if both parents are hybrid, since now every kind of germ cell from one parent can unite with one of several kinds from the other.

The genes in each chromosome tend to remain together when segregation occurs; they are therefore said to be linked. Linkage explains why some characters are correlated in heredity; not all such correlations, however, are caused by linkage—some are due to the fact that a single gene affects several traits. Even linked genes may separate in heredity; for two corresponding chromosomes, when they lie side by side just before segregation, may interchange corresponding pieces. Thus if one chromosome contains the genes *ABCDEFGF* and the other the allelomorphous genes *abcdefg*, the chromosomes may separate intact, maintaining the original combinations; or they may break and recombine so that the resulting chromosomes are *Abcdefg* and *aBCDEFG* or *ABcdefg* and *abCDEFG* and so on. Such interchange or crossing over may occur at any point in the chromosome or at more than one point; but always at corresponding points in the two chromosomes of a pair. It is the study of crossing over that has revealed the linear arrangement of the genes in the chromosomes and has enabled the geneticist, although he cannot see the genes, to map their locations. In recent years genetic maps have been verified by the fact that in chromosomes fragmented by means of X-rays specific fragments are associated with specific genes.

The frequency with which two genes in the same chromosome separate depends on the distance between them; although it may also be influenced by other genetic or environmental conditions. Usually linked genes separate less frequently than do genes in chromosomes of different pairs. When crossing over occurs therefore the different classes of germ cells are not produced in equal numbers; for any two genes the original combination is more frequent. Thus in a hybrid the different classes of germ cells and consequently of offspring may occur in almost any proportions.

The relative numbers of different classes among the offspring of a hybrid may be further modified by the fact that some combinations of genes reduce viability, with the result that the offspring receiving them are fewer in number or entirely missing. Further complications are sometimes introduced by the fact that different combinations of genes may produce similar ef-

fects, so that offspring dissimilar genetically may be indistinguishable in appearance. Thus the different classes of offspring may be present in many different proportions and any proportion is theoretically possible. The three to one ratio which is often considered a necessary consequence of the laws of heredity is only one of many possible ratios; it occurs when the two parents are hybrid for one and the same pair of genes provided that one gene of the pair is completely dominant.

This process of inheritance is known as Mendelism, after Gregor Mendel, abbot of the monastery at Brünn, who in 1865 first demonstrated the existence of genes, dominance and recessiveness and the laws of segregation and independent segregation. Mendel's work remained unappreciated and almost unknown until it was rediscovered in 1900. Linkage and crossing over have been discovered since that date.

All kinds of characters may be inherited—large and small, structural and functional (including psychological), normal and pathological, important and trivial, racial and individual. There is no justification for the distinction sometimes made between inherited and physiological characters, since physiological traits, like others, may be inherited. A character affected by the nervous system or by internal secretions is physiological; but it is also genetic, since nerves and glands, like all other parts of the body, are dependent on genes. Moreover all inheritance in man and other animals is Mendelian; that is, it depends on genes which are distributed according to the laws outlined above. It is true that the genes are not the only things transmitted from parent to offspring. There is cytoplasm in the egg and a little even in the sperm; and it is necessary for the development of an individual, since an egg deprived of its cytoplasm will die. Nevertheless, the cytoplasm is not a hereditary material in the same sense as the genes; for any differences that may exist between the cytoplasm of different eggs do not in general produce differences in the adults, since cytoplasm is not self-perpetuating but is continually manufactured under the influence of genes. Even in the very few cases in other animals—none are known in man—where adult differences have been found to depend on cytoplasmic differences in eggs, it has been shown that the cytoplasmic differences themselves have been produced by genes acting on the egg before fertilization. There is therefore no foundation for the hypothesis sometimes put forward that funda-

mental characters are inherited through the cytoplasm and only trivial ones through the chromosomes. Nor is there any essential difference between alternative and continuous inheritance; for where the offspring grade continuously into one another instead of falling into sharply demarcated groups, the continuity is only apparent and is due to the fact that the classes are numerous and the differences between them small.

The laws of heredity, which have been verified in both animals and plants, must apply equally to man, for the human chromosome mechanism resembles that of other species and the human pedigrees which have been studied are in accord with the Mendelian laws. But there is scarcely a human pedigree which by itself constitutes crucial evidence of the validity of the laws or in which we know accurately the number of genes involved or their relations to one another. This is because human families are small, generations long, information is often uncertain; and human matings are made for other purposes than the testing of genetic hypotheses.

Apart from the Mendelian theory the best known attempt to formulate a law of heredity is Galton's law of ancestral inheritance, which states that one half of an individual's heritage is contributed by the parents, one quarter by the grandparents, one eighth by the great grandparents and so on. This formula, however, can have no general validity, because an individual's heritage is made up entirely of parental genes and these are not separate from but are composed of the genes of earlier ancestors. It is true that a grandparental trait may skip a generation and reappear in the grandchildren because the gene combination involved has fallen apart in one generation and been reconstituted in the next; but the extent to which this occurs varies according to the number of genes and the degree of dominance. Galton's formula has in fact been modified by other biometricians. Galton himself did not claim any general validity for his law: he expressly limited it to certain cases and considered it applicable to populations rather than to individuals.

The scheme of Mendelian heredity has been found to require some modification in respect to sex limited and sex linked heredity. The difference between the sexes in man as in most other animals investigated depends on a single pair of chromosomes, which are known as the sex chromosomes although they affect other characters as well. In man a female has two similar sex chromosomes called the X chromosomes; a male

has one X chromosome and one smaller chromosome, the Y, which is nearly if not quite devoid of genes. Every egg contains one X chromosome. The sperm are of two kinds, some containing an X chromosome, others a Y chromosome; these are equal in number. The union of an egg with an X sperm results in an individual with two X chromosomes, which is a female; the union of an egg with a Y sperm results in an individual with one X and one Y chromosome, which is a male. Thus two sexes are produced and in approximately equal numbers. The traits which depend on whether an individual has two X chromosomes or one X and one Y include not only the primary sex characters but also the secondary sex characters, such as the beard in man. Since these characters are absent or less strongly developed in one sex than in the other their inheritance is said to be sex limited.

X chromosomes, like those of other pairs, may differ from one another in the genes they contain. Such genes and hence the traits they produce follow the distribution of the X chromosomes in heredity and are therefore designated as sex linked. They are distinguished from sex limited characters in that they are not necessarily confined to one sex. A female inherits her X chromosomes and therefore her sex linked genes equally from both parents and transmits them equally to her sons and daughters; a male, however, receives his one X chromosome and therefore his sex linked genes which are contained in it only from his mother and transmits them only to his daughters. Color blindness and haemophilia are examples of traits inherited in sex linked fashion.

Since allelomorphic genes are descended from the same original gene, the fact that they are not all identical shows that some of them have undergone changes in the past. Such changes, or mutations, may actually be observed in many organisms. Genes are stable and mutate infrequently; most of the genetic differences now existing are due not to new mutations but to mutant genes accumulated from previous generations. A mutation may occur in any cell at any stage of development but it usually occurs in only one cell and in only one gene in the cell. The mutated gene will be transmitted to the next generation only if it originates in an egg or sperm or in a cell which gives rise to eggs or sperm. Mutations have been produced artificially by subjecting organisms to radiations. X-rays and radium radiations can increase the mutation rate 150 times, ultraviolet light about ten

times. Muller, who first demonstrated the effects of radiations, has shown that there must be other causes as well, because the small amount of radiation normally present in nature is insufficient to account for the ordinary mutation rate in untreated organisms. As Muller and Altenburg have shown, high temperature slightly increases the mutation rate. No other agent has yet been proved to be effective; experiments with alcohol, lead and other chemicals have given negative or inconclusive results.

Not only the nature of genes but their number and arrangement may undergo change; for occasionally chromosomes may fail to segregate or a chromosome may break into fragments or attachments may occur between chromosomes or pieces of them. Such changes, which may also be produced artificially by radiation, sometimes modify the traits of an organism; but they are not mutations in the strict sense since they do not alter the nature of the genes.

Mutant genes often persist in the population despite their deleterious effects; since most of them are recessive, their effects in hybrids are hidden; hence they may be transmitted through hybrids for generations without being detected. This covering up of harmful effects of genes is facilitated in the human race because husband and wife are usually not closely related; hence they are not likely to have inherited the same mutant gene from a common ancestor and their offspring are not likely to be pure for such a gene. But if husband and wife are closely related they are more likely to be hybrid for the same mutant gene; some of their children will be pure for the gene and therefore its harmful effects will appear. This is the probable basis of the common belief that close inbreeding results in inferior or defective children. The kinship of the parents operates merely by rendering more probable the presence of the same gene. If the gene happens to be beneficial, the results will be good; there are of course records of cousin marriages which have produced superior children. When unrelated individuals mate, each is likely to supply genes that will dominate whatever deleterious recessives the other may contain. This probably accounts for the good effects ordinarily attributed to outbreeding in man and for the hybrid vigor often observed in crosses between distantly related races in other animals and in plants. The results of such crosses are not necessarily good; they depend on the nature of the genes in each case. Despite the common notion that outbreeding is beneficial, crosses be-

tween widely separated races of man are often said to produce inferior offspring. The social conditions to which hybrids are exposed are usually inferior to those of one parent race and sometimes of both; but if allowance is made for this, there is no actual evidence of inferiority either physical or mental due to hybridism. Usually one race differs from another in more genes than do individuals of any one race. Racial crosses produce, especially in later generations, many new combinations of genes; some combinations might be expected to be superior and others inferior to the original races (*see* RACE MIXTURE).

The environment, like the genes and the cytoplasm, is necessary for the production of the individual, since no organism can live without it; moreover environmental like genetic differences can produce differences in the traits of organisms. There have been attempts to measure what heredity produces apart from environment, as, for example, in some interpretations of intelligence tests. But the organism cannot be separated into traits of which some are purely genetic and others purely environmental. Each trait depends on both heredity and environment just as the area of a rectangle depends on both base and altitude: the two factors are necessary and a change in either alters the result.

It has been asserted that most characters are not susceptible to environmental influences. But the traits studied by geneticists are not representative in this respect; they are chosen for their stability because they are used primarily as indicators of the presence of specific genes. Nevertheless, many cases are known where differences produced environmentally are of the same kind as those produced genetically and as great or even greater. It is difficult, however, to compare heredity as a whole with environment as a whole, because characters differ in their susceptibility to environmental modification and environmental influences differ in their effectiveness; hence we cannot argue from the effect of one environment to that of others. Moreover, especially in social matters, the important question is often not whether any existing environment is effective but whether some as yet non-existent environment might not be, and this can be settled only by specific data.

Some biometrical studies have shown that the presence of a particular character is more closely correlated with the presence of the same character in the parents or other relatives than with some aspect of the environment. It is haz-

ardous to generalize from such measurements; if other characters or other environmental factors had been used, the correlations might have been and in some cases would have been different. Moreover the parent-offspring correlation is not necessarily a measure of heredity, for similarities can be produced environmentally and related individuals are usually reared in similar surroundings. This applies with special force to cases like the Jukes and the Kallikaks, where the same unfavorable environment is known to have persisted for several successive generations.

The difficulty in interpreting parent-offspring correlation could be met by proving that the distribution of the characters follows the Mendelian laws of heredity; for it seems unlikely that environmental factors would produce a precisely Mendelian distribution. In human pedigrees unfortunately such proof is rarely if ever possible. Practically any distribution may be interpreted as Mendelian if we assume the necessary number of genes producing the necessary effects. In other species the assumptions can be tested by means of critical matings; but in man such matings are not always available; and even when they are, the number of offspring is usually too small to make possible a decisive answer.

More definite evidence on the roles of heredity and environment is available from studies of twins. Twins are of two types: sometimes the members of a pair are very much alike and of the same sex, in other cases they are no more alike than ordinary brothers and sisters and may be either of the same or of different sexes. Identical twins are probably derived from the separation of a fertilized egg or embryo into two, while fraternal twins are probably derived from two distinct eggs each fertilized by a different sperm. The similarity of identical twins is therefore to be explained by the fact that they have the same heredity, being halves of the same individual. All this argues, as Galton pointed out, for the importance of heredity; but it throws no light on the effect of environmental differences, because twins are usually reared together. Recently Muller has studied identical twins reared in different environments and has found differences between them; and similar cases have been investigated by Newman with similar results. In all studies of twins the results may be weighted in favor of heredity, because identical twins differing greatly would less often be recognized as such.

Galton's own conclusion from his studies was not, as is often supposed, a denial of the importance of environment; what he said was: "There is no escape from the conclusion that nature prevails enormously over nurture when the differences of nurture do not exceed what is commonly to be found among persons of the same rank of society in the same country."

The fact that an individual may be modified by the environment does not imply that such modifications (acquired characters) are inherited by his descendants; in fact all critical experiments made to test such transmission have yielded negative results. Modification of a character does not, at any rate in the huge majority of cases, produce mutations in genes; this is proved by the fact that genes remain constant in spite of their passage through bodies of different kinds in successive generations. And even if a gene were altered in this manner, it would be in the highest degree unlikely that the effect of the mutation would be a repetition of the character which caused the mutation.

The study of the inheritance of mental traits in man is difficult because such traits are peculiarly susceptible to environment, depending as they do on a nervous system which responds to relatively minute stimuli. Nevertheless, it is certain that genetic differences in such traits exist, because individuals brought up under identical conditions may diverge very widely in mentality; although similarity of environments is also difficult to determine because of the importance of subtle differences.

Many writers have assumed a genetic basis for mental differences between classes or nations. Of this, however, there is no proof. Some of the differences are certainly environmental and as far as has been shown by actual evidence they may all be. Moreover many of the supposed differences have never been objectively demonstrated and even scientists who have sought to judge dispassionately have often been obviously influenced by preconceptions.

The problem of mental differences between races is more complicated. On the one hand, the differences between the environments—including the historical traditions—of, say, a Parisian and a Tierra del Fuegian are enormous and undoubtedly account for at least some of the differences in culture. On the other hand, it is known that genetic differences affecting physical traits exist, and it might be argued that genetic differences affecting mental traits are not likely to be absent. The latter argument may be

considered from two points of view. From the standpoint of physiology it might be supposed that some of the physical differences necessarily entail mental differences; for this there is no evidence. From the standpoint of evolution it might be said that if mutations affecting physical traits have occurred there must also have been mutations affecting mentality. This is more plausible; but it fails to take account of natural selection, which would make for a diversity of physical traits in response to different environments but would scarcely make for a comparable diversity of mental traits, since even in very different environments the same type of rational response is useful. The situation is complicated because it depends also on other factors—rate of mutation, isolation, race mixture and so on. Size of population must also be considered: a large group, even though it contains the same genes as a smaller group, will have a greater variety of gene combinations and more of the exceptional ones that produce superior individuals. Both of these factors are favorable to cultural progress. But whatever may be expected theoretically, there is as yet no conclusive evidence of genetic mental differences between races, because no study has eliminated the differences due to environment. Most claims of genetic mental superiority are inspired not so much by scientific data as by a desire on the part of some classes, nations or races to justify their subjection of others.

All the difficulties considered above apply also to genetical interpretations of cultural differences in history, with the added difficulty that even the physical traits of the peoples involved are sometimes not known. Cultural changes have occurred when a people has mixed with or been replaced by another; but in no historical case is there proof that the peoples differed genetically in mentality. Cultural changes have also come about when a people has neither mixed with nor been supplanted by another; they have sometimes occurred so rapidly that they cannot have been produced by the alteration of the population as a whole through mutation or selection. There is no evidence that the hereditary abilities of mankind as a whole have changed during the historical period, and therefore the cultural modifications that have occurred need not be ascribed to genetic changes except in so far as mutations or rare combinations of genes have produced the occasional geniuses who started new traditions which the rest of mankind accumulated. Nevertheless, man's

tremendous advance in culture since his origin has been due not merely to the accumulation of tradition but to the supplanting of less intelligent by more intelligent races. This suggested to Galton the possibility of continuing man's genetic progress by means of selective breeding consciously controlled. Such a eugenic program could of course bring about further changes; but whether these are likely to be improvements is a complicated question. It involves the problem of how standards and values are to be determined and the further problem of whether individuals embodying these standards would be recognized and selected. It is notorious that first rate minds often suffer persecution or neglect—as in the case of Mendel himself—while the less able more easily gain recognition. A eugenic program might result in eliminating the very individuals it set out to propagate.

HERESY. See APOSTASY AND HERESY.

HERGENRÖTHER, JOSEF (1824-90), German church historian. Hergenröther received his theological education at the Collegium Germanicum in Rome and from 1852 to 1879 was

professor of ecclesiastical history and canon law in his native city of Würzburg. In 1879 Pope Leo XIII made him a cardinal and prefect of the Apostolic Archives in Rome. He devoted the rest of his life to arranging and classifying the manuscript treasures of the Vatican archives and making them available for study and research.

Hergenröther's chief scientific work is his *Photius, Patriarch von Konstantinopel* (3 vols., Regensburg 1867-69), a monumental study, based on original, pioneering research, of the schisms between the Roman and the Byzantine church from the beginning to the twelfth century. Although unsurpassed in its historical and canonical erudition the book, as was the case with nearly all of the author's works, was received skeptically outside the church because of its decidedly Catholic attitude. Hergenröther's *Handbuch der allgemeinen Kirchengeschichte* (3 vols., Freiburg 1876-80; 4th ed. by J. P. Kirsch 1902-09) is still widely circulated and is important also for non-Catholics as a compendium of Roman Catholic historical views. In addition Hergenröther edited for a time the new edition of the *Kirchenlexikon* of Wetzer and Welte and began the *Leonis x Pontificis Maximi Regesta* (Freiburg 1884-91) as well as a continuation of the *Conciliengeschichte* of Hefele, both uncompleted.

As a publicist Hergenröther was the pioneer and most significant theoretician of ultramontanism in Germany. He advocated the maintenance of the Papal States and during the period from 1869 to 1871 he defended the Vatican against the attacks of Döllinger and his friends. The ultramontanes considered his *Anti-Janus* (Freiburg 1870; tr. by J. B. Robertson, Dublin 1870) a victorious refutation of all objections to the dogma of papal infallibility. At the beginning of the *Kulturkampf* Hergenröther, still actively combating Döllinger, issued his most effective and most representative work, *Katholische Kirche und christlicher Staat in ihrer geschichtlichen Entwicklung* (2 vols., Freiburg 1872; English translation, 2nd ed. London 1876). In this book he developed on the basis of Christian history the doctrine of the necessity for spiritual-papal influence in the broad spheres of political life. He interpreted the Roman claims, however, in the mildest possible form and like the Thomists accepted a natural parallelism between the will of the state and that of the church. On the whole, Hergenröther as both historian and controversialist gave new encouragement to the wavering

Catholicism of Germany and paved the way for the teaching of Leo XIII.

HERMANN, FRIEDRICH BENEDIKT WILHELM VON (1795-1868), German economist and statistician. After teaching mathematics in a secondary school Hermann was appointed in 1827 to the chair of *Kameralwissenschaften* at Munich. After 1839 he also directed the Bavarian statistical bureau, which upon its reorganization in 1850 ranked second only to the Prussian bureau. Hermann was one of the most important and independent representatives of the Smith-Say school in German economics. His only theoretical work, *Staatswissenschaftliche Untersuchungen* . . . (Munich 1832, reprinted Leipsic 1924; 2nd enlarged ed. prepared by G. von Mayr and J. A. R. von Helferich, Munich 1870), marked by originality and close reasoning, stands out among those prolix treatises abounding in definitions and classifications which typify the early period of the school in Germany. As a statesman, however, Hermann shared the mercantilist views of the Bavarian government, favoring moderate protectionism and preservation of some features of the old agrarian order. He advocated retention of the silver standard (in *Archiv der politischen Oekonomie und Polizeiwissenschaft*, vol. i, 1835, p. 58-100, 141-206), contending that not only the exigencies of international trade but also the relative riches of the country must be considered in selecting a monetary standard. Hermann is also responsible for the first official life table covering an entire state; in its computation he used a new and more exact method for the purpose of relating deaths in various age groups to the generation in which they occurred. In politics he was a leading figure of the liberal *grossdeutsche* party. In the Frankfurt parliament of 1848 he advocated the unification of all German states including Austria, and at the Vienna customs conference in 1852 he urged an all inclusive German customs and commercial union.

Hermann's price theory is an exhaustive analysis of demand and supply factors which synthesizes the results of earlier studies by the best continental economists. On the demand side he

distinguishes the use value of the commodity to the buyer, the purchasing power at his disposal and the cost of acquiring the commodity by other means, i.e. by purchasing it in other markets or by producing it. The factors on the supply side are the cost of production, the price at which the commodity sells in other markets and the value of money. Hermann's is primarily a short run price theory; although it lacks a developed concept of price equilibrium it takes account of the subjective valuations as well as of the monetary factor (money value on supply side, income distribution and price level on demand side) and of market organization.

Hermann differed from his contemporaries who identified capital with production goods or a wages fund; in his view capital comprises durable goods which yield utilities over a long period. This definition of capital was basic to Brentano's refutation of the wages fund theory and is now accepted by many authorities. It led Hermann to modify Say's productivity theory of interest into what Böhm-Bawerk called the use theory and to drop the distinction between rent and interest except where rent is due to natural scarcity. Hermann's definition of income, which dominated the German literature of the nineteenth century, is also related to his concept of capital.

HERO WORSHIP. The term hero, which in classical antiquity was applied to the deified dead, has been used by historians to designate outstanding founders of states and religions and representative personages of civilization who are regarded as benefactors of mankind. A distinction has been made between mythical heroes and great men of history: the heroes have been derived from religion, the great men from epic narrative. But *heros* in Greek has the meaning of a perfect man, the perfect expression of the ideal of a group in whom all human virtues unite; and in Homer as in other literatures it signifies a leader in war. The ideal of physical strength as of moral achievement changes with

the times and the civilization of the particular group, as is shown by the story of Hercules. In Christian times martyrs have been converted into heroes; the saints have been made into heroes as ideals of the monkish orders. There are heroes of war as of art; conquerors and discoverers alike are regarded as heroes—Garibaldi and Columbus, for example, have become objects of hero worship. The heroes are exemplars and champions of ideal values, for in the hero the group sees its values realized. As heroes are identified with a particular group, the ancestor has often been regarded as the original hero of clans and families and has been considered a protective deity. Sects and orders, classes and callings, have also their special heroes.

Hero worship is the result of election and selection, for the heroizing is done mostly by public authorities—the oracle of Delphi, the Roman Senate, the Catholic church and the national states have all taken charge of the canonization. The solemn appointment in ritualistic forms inaugurates hero worship as a public institution; in the Roman Empire, for example, the hero worship of the emperors was a civic duty. As the authority of the family and of political government was derived from hero worship, the hero's opinions and actions had to be interpreted and the tradition concerning them is therefore preserved in literature as well as in the rites of the cult. Knowledge of ancient hero worship is derived from such legend. The hero is a human being exalted against the gods and into the world of the gods. Heroes have become gods and gods heroes in accordance with the need of the group for simplification and embodiment in a living symbol. The heroes as living gods upon the earth, rendering legitimate cult and civilization, state and clan, are mythical or historical figures whom man has deified in his own right. The priest kings or god kings, such as the pharaohs who required worship and reverence by divine right, are therefore not called heroes. Hero worship did not originate in the great political groups but in clans and tribes with their elders and chieftains; it was adopted in the Roman Empire.

Authentic historical personalities who live on in tradition become mythical figures. Leaders, because of heroic acts of conquest and achievement, of emancipation and protection of their groups, are worshiped as heroes. They become not only representatives of the group ideals but likewise models of virtues and, like coats of arms, emblems and banners, have the force of

symbols. Certain heroes are given godlike attributes and appear as spirits that cross the borders between this life and the beyond. They may be the chosen of God or they may be chosen by men in defiance of God; in either case they unite human and divine attributes and therefore appear as sons of the gods. In Greece hero worship was associated with the worship of the chthonian deities; like these gods the heroes resided under the earth. Hero worship has combined with the worship of local spirits or special gods, especially in the seasonal festivals. The myths of the death and resurrection of heroes have been combined with the spring festivals; in these cases the hero is but the personification of the drama of nature. Tragedy and dithyramb, which originate with the feasts of Dionysus and the sacrifices of rams and bullocks, suggest another ritual, the cult of the dead. The heroes are the select among the dead; the idea of the immortality of the heroic man precedes the hope of immortality for all men. The hope of salvation therefore is bound up with the dead, who not only live on in the memory but engage in posthumous activity. Like the gods, the heroes live discontinuously in the world among men.

Heroes are the subject of the first history, legend, and become superhistorical in myth. The death of the hero is the central point of legend as of myth. Osiris, Adonis and Balder, like Roland, Siegfried and Joan of Arc and other saints, are divine worthies whose deaths become part of the history of their people. The apotheosis of the dead is also evidenced by the memorials in stone and wood erected to them, which from Achilles to Garibaldi have been established not in ordinary cemeteries but on consecrated ground in the midst of cities. The beginnings of historical writing, of epic and of drama are occupied solely with heroes, for they are the only dead who preserve their personality. Their physical as well as moral activity remains bound up with certain places; their relics have efficacy—they insure victory, harvest and protection. The death of the hero is regarded as death for the group's values and labors, whether the hero has brought or determined state and civilization, victory and salvation or religion and worship, sacrifice and solemn assembly.

In modern times hero worship becomes a political and aesthetic affair, closely connected with individualism, which serves for the justification of the history of a people and the glorification of its great men. Great men, born rulers and geniuses in art are esteemed the creators of new

intellectual and political conditions; they are what Emerson calls representative men who serve as symbols and as directing spirits—the motive power in the life of the multitude. It is a heroic conception of history that explains these leaders whose thirst for authority and fame dictates mass interests as the prompters of the trend of the times. This individualism is at first bound up with the rationalization of a society that is losing its consensus and is replacing it by a hierarchy. The society can be held together only by the reason of the great men, the advanced spirits, wise monarchs, victorious generals. Court historians have interpreted the events *ad maiorem gloriam* of their princes, so that history appears as a mere recital of the acts of kings and their armies. Social movements and political changes are explained by the impulses and aims of rulers; demigods justify their exalted positions to their subjects by their success. The worship of success characteristic of absolutism has passed from statesmen to captains of industry; for capitalism, at whose head march princely entrepreneurs, explains the profit on capital as the reward of the genius of specially gifted men. Just as creators and discoverers in art and science, who are regarded as embodiments of the spirit, transfigure the common life and have a compensatory influence, so also in state and commonwealth this quasi-religious conception of the demi-urges of history is founded upon an idea of the inequality of men. Difference in endowment is held to explain one's place in society whether high or low, rich or poor. It is a typically bourgeois idea at a time of advancing science and technique, at a period of discovery and conquest, to ascribe the stage of cultural achievement to creative ability. This Promethean conception underlies the idea of prestige which exists or is stimulated in public opinion. Goethe and Kant, Napoleon and Frederick the Great, Washington and Bismarck, and other historical figures have acquired a heroically mythical character through the social and political structure of society. In Carlyle's discussion of hero and hero worship, as in Nietzsche's concept of the superman, worship of success is made legitimate by romantic individualism. As Tarde derives all social achievement from invention as imitation, so the changes in civilization are traced to the inspiration of great men. These great men are divorced from their environment, are exalted above their fellows and function like a lucky accident or a sudden revelation. But as Ward has shown in *Pure Sociology* every innovation,

discovery and invention can be traced to slow improvement by small increments and their effects, to the group's degree of maturity and its need of change. Geniuses thus appear only as forerunners or final results. A conception of history that is based upon exceptional endowment, accident, catastrophe, through the action of great men, has a bourgeois cast in its pragmatism and is along with its worship of genius and heroes the latest derivative of a theology of charismatic leaders inspired of God. In modern times the legend and rite of hero worship are merely replaced by modern forms of homage as set forth in press and film and developed in multitudinous social honors.

HERODOTUS OF HALICARNASSUS (c. 484-c. 429 B.C.), ancient Greek historian. Herodotus, known as the "father of history," wrote the story of the Persian wars against the Greeks, handling his subject in a broad human way peculiarly his own. In antiquity the matter of fact dismissed his stories as mere lies; but with modern discoveries, such as the deciphering of the Persian inscription on the rock of Behistun, his credit has steadily risen and he is today recognized as the father of anthropology as well. His book is full of intelligent observation of the usages of uncivilized peoples, their diet, marriage customs, government and religious beliefs. His credulity has been a legend with careless readers, but he is in fact careful to distinguish between tales told, things seen and inferences drawn. No book gives such a panorama of the ancient world; but it is more than that. It is the expression of a whole man and a very remarkable man. Ancient critics recognized his charm, "delighted in it to the last syllable and longed for more." Moderns vie in declaring that his breadth of sympathy and his interest in human things place him nearer to Shakespeare than to Thucydides and next to Homer as the exponent on a generous scale of the thought and life of his people; Wordsworth pronounced his work "the most interesting and instructive book, next to the Bible, which had ever been written." He is strangely free from race prejudice; he was reproached in antiquity for his praise of Persian valor as for his imputation of Carian ancestors to Greek patriots. Civilized Egyptian and barbarous Scythian alike interest him, and he makes every race he visits alive for his reader. A vivid, amusing man, who traveled widely "for the sake of inquiry," he had the gift of being at leisure; he was apt to talk well of things ancient and modern and ready to listen to a well told tale; he was a delightful companion and no mean judge of truth. All his gifts pass into his book, a record of wars indeed but also of friendships, a book that makes the reader more human the more he enters into it.

HERRENSCHWAND, JEAN (Johann) (1728-1811), Swiss economist. Little is known of Herrenschwand's life, except that he lived in Paris and in London and for a time held a judicial

post in France. His views, which were rooted in the deism and rationalism of his age, were based on the assumption that human nature is capable of infinite improvement and that human destiny manifests itself in an uninterrupted growth of population coupled with a progressive unfolding of human intelligence. It is the task of political economy to formulate policies which will aid the government in directing the course of human destiny. Herrenschwand discerned three stages in the economic development—the hunting, the pastoral and the agricultural—and concluded that a system which combines agriculture with industrial development is best suited to the realization of human progress. He appreciated the importance of money as an activating force in economic life, realized the difficulties involved in the securing of sufficient supplies of precious metals for currency needs and advocated the use of public credit for the purpose of issuing paper notes redeemable at fixed intervals. The issue of the notes was to be adjusted to the needs of trade as measured by the index of employment. He favored moderate profits and low rates of interest but was opposed to reduction of wages. He argued for economic self-sufficiency and condemned foreign trade as exposing the country to the uncertainties of distant markets; moreover, he did not believe that foreign trade increases the stock of gold.

Herrenschwand has been variously classified as a mercantilist and as a physiocrat, but he occupies a unique position in the history of economic thought. His concept of human nature was borrowed from Shaftesbury, his view of predestination may be traced to Clarke and his population policy seems to have been influenced by James Stuart.

LOUISE SOMMER

Important works: *De l'économie moderne, discours fondamental sur la population* (London 1786); *Discours sur le commerce extérieur des nations européennes* (London 1787); *De l'économie politique et morale de l'espèce humaine*, 2 vols. (London 1796).

HERTZBERG, EBBE CARSTEN HORNE-MAN (1847-1912), Norwegian economist and legal historian. In 1877 Hertzberg became professor in the university at Oslo, first teaching political economy and later legal history. He was

also a director of the Norwegian Land Mortgage Bank and keeper of the public records.

After instruction by A. M. Schweigaard, whose life he wrote, he went to study legal history at Munich under the guidance of Konrad Maurer, whose history of northern law he later edited. Of his economic writings the earliest, *Om kreditens begreb og vaesen* (Christiania 1877), which dealt with the nature of credit, and *En kritisk fremstilling af grundaetningerne for seddelbankers indretning og virksomhed* (Christiania 1877), which dealt with the principles of the organization of banks of issue, were more theoretical than later works, in which his vision of history and practical sense of realities were more in evidence. This is true of *Det europæiske landbosamvirke* (Christiania 1901, written in collaboration with J. Bull-Tornøe), an inquiry into European agricultural cooperation, and *Den norske kreditbank 1857-1907* (Christiania 1907, in collaboration with N. Rygg), which dealt with agricultural credit conditions. His change from a free trade to a protectionist tariff position decisively influenced legislation.

It is, however, as a legal historian that Hertzberg has left his deepest mark. He was a pioneer in his work *Grundtraekene i den aeldste norske proces* (Christiania 1874), dealing with the characteristics of the oldest Norwegian lawsuit and remarkable for its acute demonstration of the significance of *vitterlighed* (obviousness) and the consequent distinction between obvious and non-obvious cases. In this field belong also a series of papers of an exegetico-historical nature and the *Glossarium til Norges gamle love indtil 1387* (Christiania 1895), the masterly glossary to the ancient laws of Norway. But his greatest scientific achievements from a general point of view were the basic ideas which permeated his exceptionally brilliant work. He held that the study of the application and operation of law could not be distinguished from the study of law itself. He insisted on legal history as the true core of all history. He saw law as a product of life, and he was the most eminent Scandinavian exponent of the ideas of modern legal history.

FRANTZ DAHL

Consult: Taranger, Absalon, in *Tidsskrift for retsvidenskab*, vol. xxv (1912) 486-89, and in *Videnskapselskabet i Kristiania, Forhandlinger* (1912) 58-63.

HERTZENSTEIN, MIKHAIL YAKOVLEVICH (1859-1906), Russian economist and politician. Hertzstein studied law and economics in Russia and abroad and developed an early in-

terest in Rodbertus' theory of rent. When he was refused an appointment to a Russian university because of his Jewish origin Hertzstein obtained a clerical position in the Moscow Land Bank, where he soon attained a prominent rank. He was appointed *Privatdozent* at the University of Moscow in 1902 and professor of economics at the Moscow Agricultural Institute in 1904. At the same time he took a leading part in political life as a member of the Constitutional Democratic party, contributed to the influential liberal press and was elected in quick succession to the Moscow municipal council and to the first Duma. By his advocacy of a moderate program of land reform he incurred the hostility of the large landowners and their adherents and was shot by hired assassins a few days after the dissolution of the Duma.

Hertzstein's scientific interest was largely centered around the problem of credit, particularly that of land credit. In his book *Kredit dlia zemstv i gorodov* (Credit for zemstvos and cities, Moscow 1892), the best Russian work on the subject, he developed a program of enlarging the credit facilities and credit institutions for local autonomous bodies. In the last and best of his works, *Noveyshiya techeniya v uchenii o pozemelnom kredite v Germanii* (Latest trends in the theory of land credit in Germany, Moscow 1905), he proved that the problem of land credit cannot be solved by the "single heir" system or by fixing the limits of indebtedness: such measures would only accentuate the unequal distribution of land. The growth of indebtedness is inevitable in capitalistic society, but some of its consequences may be removed by enlarging public land credit institutions, restricting or abolishing private mortgages and definitely separating short term and long term credit operations.

V. TVERDOKHLEBOV

Other works: *Reforma ipotechnago kredita v Germanii* (Reform of mortgage credit in Germany) (St. Petersburg 1900); *Ipotechnie banki i rost bolshikh gorodov v Germanii* (Mortgage banks and the growth of the large cities in Germany) (St. Petersburg 1902).

HERTZKA, THEODOR (1845-1924), Austrian journalist and economist. Hertzka was born of Jewish parents in Budapest. He was economic editor of the *Neue freie Presse* of Vienna from 1872 to 1879, when he founded the *Wiener allgemeine Zeitung*, which he edited until 1886. In 1889 he established the weekly *Zeitschrift für Staats- und Volkswirtschaft* and in 1901 became editor in chief of the daily *Magyar hirlap* in

Budapest. He wrote a number of volumes on trade and monetary questions and on the social problem but is best known for his novel *Freiland*, the story of the founding of a utopian state in equatorial Africa. Here productive associations under elected managers initiate production on their own responsibility, moved by self-interest and competing on the market for money profits which are distributed among the members according to work done. They pay no rent and borrow their capital, on which they pay no interest, from the state. The cardinal principle is the right of every citizen to join freely any association, full publicity being given to all data of production. Thus, Hertzka argued, the elimination of unearned income and a balanced income distribution could be effected automatically. He believed that the resulting increase of consumer purchasing power would lead to an extraordinary increase of production. Hertzka's concept is socialistic in that it criticizes capitalism for depriving the worker of the product of his work but liberal in that it aims at achieving social justice on the basis of free enterprise. It is utopian both as to the conditions under which an attempt to introduce the new scheme might become possible and in its assumption that through a few simple principles of organization the whole social problem may be solved directly. Although essentially utopian *Freiland* contains also some sound scientific analysis. It attracted much interest, helped to keep alive the belief in the possibilities of liberal social reorganization and led to an abortive attempt at utopian colonization. Its ideas survive in so-called liberal socialism and Franz Oppenheimer has recognized that his own sociological system is based on Hertzka's as Hertzka's was on Dühring's.

HERZEN, ALEXANDER IVANOVICH (1812-70), Russian political writer and pioneer socialist. Herzen, a brilliant representative of

that generation of intellectuals which matured in the period between the European revolutions of 1830 and 1848, was the illegitimate son of a rich nobleman and a poor German girl. He was educated by French and German tutors, underwent the influence of the romanticism of Rousseau and Schiller and studied natural sciences at Moscow University from 1829 to 1833. Under the double influence of the revolutionary tradition of the Decembrists of 1825 and the doctrines of Pierre Leroux and Saint-Simon, Herzen played a minor role in the underground discussion groups of Moscow students. He tried to refute eighteenth century materialism by means of German *Naturphilosophie* and the idealism of Schelling and later went over to the Hegelian left. In 1835 he was banished to a provincial town. Returning to St. Petersburg in 1840 and, after a second exile, to Moscow, where he remained from 1842 to 1847, he found his friends divided into the camps of "westerners" and "Slavophiles" and participated in their lively debates on the history, spirit and destiny of Russia. Without joining either camp he shared their common interest in Russia's "mission." Contrary to the liberal westerners he found promise in the archaic Russian village community (the mir); contrary to Slavophile traditionalists he looked for the mir to evolve into a socialist commune. He hoped that the Russian "barbarians" would bring this "new faith" to a decaying Europe as the ancient barbarians brought Christianity to dying Rome.

Herzen left the reactionary Russia of Nicholas I in 1847 just in time to greet the French and Italian revolutionary movements. He soon concluded that the revolutionary mask hid the face of the hated bourgeoisie and, when the new French Republic of 1848 turned reactionary and began to collapse, he saw no alternative except social revolution. For a moment he found himself in close touch with Proudhon's teachings, although his revolutionism remained political, not economic. In 1852 he fled to London from the new wave of European reaction. Political skepticism combined with personal misfortune—the deaths of his mother, son and wife—led Herzen to retire; he now wrote his famous memoirs. Despairing of future revolutionary progress in Europe he turned again to Russia, where new possibilities of political action opened for him with the accession of Alexander II and Bakunin's return from Siberian exile. He founded a periodical, *Kolokol*, in whose pages the free word first appeared in the Russian lan-

guage, unhampered by censor or police, exposing the government's secrets, criticizing bureaucratic abuses, approving the good intentions of the czar, the "liberator," and trying to dictate to him a reform program. A kind of open conspiracy arose between the émigré journalist and his numerous readers in Russia, including members of the upper classes and highly placed officials; but his personal influence, now at its climax, was soon brought to an end. The intentions of the government did not at all correspond to the utopias of a social reformer dreaming of a constitutional assembly and a thorough reconstruction of the state on a "communal" basis. The reaction which set in left no alternative to the young Russian socialists but revolutionary peasant uprisings, and the Polish revolution of 1863 seemed to prove that alternative a valid one. Unlike Bakunin, who joined the youth, Herzen argued against the use of force. Nevertheless, he defended the Polish revolutionaries, thus undermining his influence in Russian nationalistic circles. His subsequent attempts to preach patience, based on his distrust of the peasants' socialism and of revolutionary tactics, cost him his authority among the younger generation. Led by Chernishevsky, the younger declassed democrats rejected his theories. He died, disillusioned, depressed and lonely, in Paris.

PAUL MILIUKOV

Works: *Polnoe sobranie sochineni i pisem*, ed. by M. K. Lemke, 21 vols. (Petrograd 1919-23).

Consult: Labry, Raoul, *A. I. Herzen, 1812-70* (Paris 1928), and *Herzen et Proudhon* (Paris 1928); Sperber, Otto von, *Die social-politischen Ideen Alexander Herzens* (Leipzig 1894); Steklow, Georg, "Alexander Herzen und Nikolai Tchernishevsky" in *Archiv für die Geschichte des Sozialismus und der Arbeiterbewegung*, vol. viii (1919) 1-39.

HERZL, THEODOR (1860-1904), Jewish national leader. Herzl was born in Budapest and early became a proponent of racial assimilation and baptism. In 1891 he joined the editorial staff of the Vienna *Neue freie Presse* and became its Paris correspondent. He reacted to the virulent antisemitism of the Dreyfus affair by rejecting as impossible the theory that large scale assimilation could be a solution of the Jewish question. Antisemitism he saw as a deep rooted social phenomenon dependent upon the ubiquity and abnormal situation of the Jewish race and forcing the Jews to be a separate nationality even against their will. By proclaiming, "We are a people, *one* people," he ruled out the

theory of assimilation (that Jews were only a religious community) and of disintegration (that Jews in different countries form different communities). In line with the then dominant *Nationalstaat-Idee* Herzl believed that a national group could satisfy its legitimate aims only by becoming sovereign over a given territory. The Jews, being a dispersed national group living under abnormal conditions (economic and political distress in eastern Europe and moral inferiority in western Europe), must become a nation by emigrating en masse, concentrating and creating a Jewish state, where they would be able to lead a free and normal life. At the same time they would liberate from the anxieties of the Jewish problem countries which they had heretofore inhabited in large numbers. Herzl looked first for an unpopulated territory large enough to receive millions of Jews, but for historical and sentimental reasons he later chose Palestine. He became the leader of the Zionist movement and the founder of the Zionist organization. As its first president from 1897 to 1904 he opened negotiations with the sultan of Turkey and representatives of European powers to obtain a charter which would be the legal basis of a Jewish state in Palestine. Although in his last book, *Altneuland*, Herzl proposed to create in Palestine a mixed "new society" in which Jews would be the moral and intellectual leaders without any predominance of numbers, language or national culture over non-Jews, it was his idea of concentrating the many millions of Jews in a Jewish state that, without proving realizable, exercised the chief influence both on the rebirth and orientation of Jewish national consciousness and on the post-war history of Palestine.

HANS KOHN

HESS, MOSES (1812-75), German socialist and Jewish nationalist. Hess was born in Bonn, the son of a manufacturer. He had some business experience and later pursued rather unsys-

tematically the study of philosophy. After 1841 he was active in many communistic groups and lectured to revolutionary clubs of German artisans in Paris. He was one of the founders and editors and later the Paris correspondent of the *Rheinische Zeitung* (1842-43), which was an important factor in early German socialism despite its suspension by the Prussian government after fifteen months of publication. In 1863 he was associated with Lassalle's union and in 1867 he joined the International.

Hess was the chief representative if not the creator of that "true" or "philosophical" socialism which was demolished by the *Communist Manifesto* (1847). In numerous articles published during the 1840's in left Hegelian and early communist periodicals he developed his "politicising" philosophy. He urged Marx to socialism and won Engels for communism. By introducing the ideas of action and will he radically transformed Hegelian theory, which regards evolution as spontaneous and may lead to quietism. While Feuerbach applied his theory of self-alienation and objectification only to theology, Hess broadened it to take in historical and economic categories (politics, monarchy, property, money, the state). The concept of free labor, undistorted by private property and identical with real enjoyment, was crucial with him. Once established, it would not only overcome inequalities which technical development must create through capital concentration and mass impoverishment but would also develop the "essence" of man as a social species, to which the state (as "the embodiment of the idea of morality") leads but through which the state would finally be surmounted. Like most radicals of the 1840's Hess regarded socialism not as a bread and butter or a class question, but as a humanitarian question solved by education and the organization of labor. Socialism is to him practical ethics. While from 1846 to 1851 he seemed to approach historical materialism under Marx' influence, Hess continued to view non-economic factors as of fundamental significance for historical development and the achieving of socialism. Although the study of natural science led him to renounce all preferences for specific racial characteristics, he considered nationalities, with their separate endowments, to be the predestined instruments for the achievement of a free, united human race. In Jewry he saw the motive force in the movement toward such unity. The mission of Jewry extends far into the future: it is the guaranty of the coming of the Messianic

age, in which despotism and immorality will be abolished and in which communal life will be based on the recognition of God (knowledge of the unity of the cosmic, organic and social realms) and the self-limited freedom of the individual. For this supernational task the Jewish people must be preserved as a nationality and secured by a national home in Palestine. He advocated Jewish colonization of Palestine with the support of France, the "creative genius of all human progress." Although his project aroused little enthusiasm at the time, Hess' theory became an important factor in the ideology of Zionism.

THEODOR ZLOCISTI

Important works: *Die heilige Geschichte der Menschheit* (Stuttgart 1837); *Die europäische Triarchie* (Leipzig 1841); *Rom und Jerusalem, die letzte Nationalitätsfrage* (Leipzig 1862, 2nd ed. 1899), tr. by M. Waxman (New York 1918); *Sozialistische Aufsätze*, ed. by Theodor Zlocisti (Berlin 1920); *Jüdische Schriften*, ed. by Theodor Zlocisti (Berlin 1905).

Berlin 1921); Lukács, Georg, "Moses Hess und die Probleme der idealistischen Dialektik" in *Archiv für die Geschichte des Sozialismus und der Arbeiterbewegung*, vol. xii (1926) 105-55; Goitein, Irma, "Probleme der Gesellschaft und des Staates bei Moses Hess," *Archiv für die Geschichte des Sozialismus und der Arbeiterbewegung*, supplementary no. v (Leipzig 1931); Mielke, Karl, *Frühsozialismus: Gesellschaft und Geschichte in den Schriften von Weitling und Hess* (Stuttgart 1931); Kohn, Hans, "Moses Hess" in Kohn, Hans, and Welsch, Robert, *Zionistische Politik* (Ostrau 1927), tr. in *Menorah Journal*, vol. xviii (1930) 399-409.

HETHERINGTON, HENRY (1792-1849), English radical. Hetherington, a compositor by trade and an Owenite and freethinker by conviction, believed that it was necessary to dispel the ignorance of the masses before their political emancipation and subsequent happiness could be secured and that the cheap periodical was the best means available for such education. As proprietor, printer and publisher he led the working class protest against the newspaper stamp duties, the so-called "taxes on knowledge." On December 25, 1830, Hetherington began to publish the *Poor Man's Guardian* (London 1831-35), deliberately unstamped in order "to try the power of Might against Right" and to "deny the authority of our 'lords' to enclose the common against us," for which he served a sentence of six months' imprisonment. During 1832-33 he undertook the publication of the *Republican* and the *Destructive, or People's Conservative*. In 1832 he again was sentenced to prison and in the next

few years cheerfully sacrificed money and personal freedom in the agitation which was carried to a successful issue in 1835-36.

Hetherington was also an excellent orator and organizer. A staunch Chartist, he was treasurer of the London Workingmen's Association, founded in 1836, and an advocate of Chartist ideas in the *Twopenny Despatch* (London 1836-39). During the revival of Chartism in 1840 he was the leading figure in the new London society, the Metropolitan Charter Union, formed to unite all radicals and to keep Chartist principles before the public through the peaceful means of lectures, pamphlets, periodicals, the opening of reading rooms, coffeehouses and cooperative stores; in 1841 he was first secretary of the National Association for Promoting the Political and Social Improvement of the People. A strong believer in trade unions and political action for the working class, he was, says Holyoake, "the first trade unionist who told his colleagues that the cooperative workshop was the bulwark of the strike, and that they were not to rob any class, but take care no class robbed them."

HEUSLER, ANDREAS (1834-1921), Swiss jurist and historian. Heusler was a pupil of his father, Andreas Heusler, and of Johannes Schnell, F. L. Keller and Briegleb. His long life was spent in his native Basel. He was professor at its university from 1863 until 1916, president of the Basel Court of Appeal from 1891 to 1907 and served Basel as a legislator in drafting a code of civil procedure which was put into effect in 1875. Heusler's fame rests chiefly upon his work in two special disciplines, mediaeval German law and civil procedure. He wrote a study on possession, *Die Gewerbe* (Weimar 1873), and on execution in movables, *Die Beschränkung der Eigentumsverfolgung bei Fahrhabe* (Basel 1871). His greatest achievement, however, is the now classic work, *Institutionen des deutschen Privatrechts* (Leipsic 1885-86). In demonstrating the great influence of mediaeval German law (apart from the received Roman law) upon the existing civil law of Germany, Austria, Switzerland and other countries he fortified the traditions of the folk laws. In sharply contrasting the institutions of the German law in their historical development with

those of the Roman law he influenced the conservation of old Germanic institutions in the German and Swiss civil codes. Heusler stood for the conservation of historical and local differences of law without excluding necessary centralization in some essential matters.

EDUARD HIS

HEWITT, ABRAM STEVENS (1822-1903), American capitalist. Hewitt was an iron manufacturer of considerable importance who became a director of the United States Steel Corporation upon its organization in 1901. His chief significance, however, lies in his ideas on the relations between labor and capital. Hewitt's interest in this subject was intensified by the outburst of strikes during the hard times prevailing after the panic of 1873. He considered unions to be "at war with the fundamental principles of the social order," although he was willing to tolerate unions which did not strike. But Hewitt went beyond the mere opposition to unions which characterized the policy of most of his contemporaries. He urged the settlement of industrial disputes by government tribunals; final peace between labor and capital, however, was to be achieved only by the democratization of corporate ownership through employee stock ownership. "By abstinence, which is the parent of capital," said Hewitt in *The Mutual Relations of Capital and Labor* (New York 1878), the workers can in a generation acquire sufficient savings that "the whole capital invested in industrial undertakings might be transferred to the wage-earning class." He played an important part in the introduction of employee stock ownership and other welfare practises by the United States Steel Corporation. Hewitt supported the corporation's opposition to unionism and its suppression of the steel workers' strike in 1901; one year later he urged "stern repression" of the anthracite coal miners' strike, although public opinion and President Roosevelt favored arbitration of the dispute. He was a reform Democrat in poli-

tics and in 1886 defeated Henry George in the election for mayor of New York City.

HEYD, WILHELM VON (1823-1906), German economic historian. Heyd was born in Markgröningen, the son of a clergyman. Although he was educated to be a theologian he developed an early interest in the study of history. After completing his studies he made a protracted stay in Italy and brought back a lively interest in Italian commercial policy during the Middle Ages. For a time he acted as private tutor at the evangelical seminary in Tübingen and in 1857 he obtained the position of librarian at the Landesbibliothek at Stuttgart, which he held until his retirement in 1897. Heyd's chief work is the *Geschichte des Levantehandels im Mittelalter* (2 vols., Stuttgart 1877-79), the second enlarged edition of which appeared in French (*Histoire du commerce du Levant au moyen-âge*, tr. by M. Furcy-Raynaud, 2 vols., Leipsic 1885-86). Based on a vast array of facts culled from contemporary official documents, travel books of pilgrims, chronicles of crusaders and account books of mercantile establishments, the book is the most thorough and authoritative study of the commercial relations between the Roman-German world and the Byzantine Empire during the Middle Ages. This work was preceded by a series of studies which appeared originally in the *Zeitschrift für die gesamte Staatswissenschaft* in the years 1858-65 and were collected in an Italian translation under the title *Le colonie commerciali degli italiani in Oriente nel medio evo* (2 vols., Venice and Turin 1866-68). Scattered studies dealing with the house of German merchants in Venice and the development of commercial relations between Swabian cities and Italian cities, Lyons and Spain appeared in various historical publications (*Historische Zeitschrift* for 1874; *Württembergische Vierteljahrshefte für Landesgeschichte* for 1880 and 1893; *Forschungen zur deutschen Geschichte* for 1884). Heyd devoted also a separate book to the merchant company of Ravensburg which in the fourteenth and fifteenth centuries maintained active commercial relations with Italy, Spain and the Netherlands (*Beiträge zur Geschichte des deutschen Handels. Die grosse Ravensburger Gesellschaft*, Stuttgart 1890).

HEYN, OTTO (1860-1920), German monetary theorist. An independent and prolific writer, Heyn exerted a stimulating influence upon the discussion of currency problems in Germany. His studies were the outcome of his close contact with the realities of economic life; for years he was syndic of the Chamber of Commerce in Nuremberg. A forerunner of nominalism and chartalism, he believed that the value of the currency unit is based not on the value of the material of which the money unit is made, but rather on the latter's functions as a medium of exchange and a token of purchasing power. These functions impart to money an element of value independent of and apart from the value of its material content. While he did not believe in the feasibility or even desirability of a stable value of money Heyn recognized the necessity of confining the range of fluctuations within limits narrow enough to prevent undue disturbances of the price level. When these limits are observed and the supply of money is adjusted to the requirements of trade, paper money possesses distinct advantages over metallic currency. He urged, however, the maintenance of gold reserves as a means of stabilizing foreign exchange rates and thus paved the way for the development of the gold exchange standard. Furthermore, gold reserves are necessary as a concession to popular opinion, which still associates the soundness of token money with the existence of gold reserves.

FRANZ GUTMANN

Important works: *Papierwährung mit Goldreserve für den Auslandsverkehr* (Berlin 1894); *Kritik des Bimetallismus* (Berlin 1897); *Theorie des wirtschaftlichen Werths* (Berlin 1899); *Irrthümer auf dem Gebiete des Geldwesens* (Berlin 1900); *Die indische Währungsreform*, Schriften des Vereins zum Schutz der deutschen Goldwährung, vol. iii (Berlin 1903); *Unser Geldwesen nach dem Kriege*, Finanzwirtschaftliche Zeitfragen, vol. xxviii (Stuttgart 1916); *Über Geldschöpfung und Inflation* (Stuttgart 1921).

HIDALGO Y COSTILLA, MIGUEL (1753-1811), Spanish American revolutionist. A graduate of the college of San Nicolás in Valladolid, Hidalgo y Costilla later studied theology at the University of Mexico. He taught philosophy and theology at the former institution and was for a short time its rector. Noted as a man of vast learning and liberal views, he was haled before

the Inquisition several times on the charge of teaching heresies. He was ordained to the priesthood in 1778 and subsequently occupied a number of curacies. While he was parish priest of Dolores from 1803 to 1810 Hidalgo attempted to improve the wretched condition of the Indians by agricultural and industrial education. He taught them the culture of the vine and the cultivation of the silkworm with a view to establishing wine and silk industries, which were forbidden by the Spanish government. A factory was founded for making pottery, brick and other simple articles. Realizing, however, that social betterment was impossible while Mexico was governed for the benefit of Spain, he became active in the political revolutionary movement.

Hidalgo is known as the father of Mexican independence. The epoch of his greatest achievement fell within the last decade of the viceroyalty of New Spain, a vast kingdom which then extended all the way from the northern border of Central America to Texas, New Mexico and California. When news of a projected rising became known he started from his curacy of Dolores in September, 1810, with a few followers. His army grew rapidly as town after town fell into the hands of his looting troops and at one time his motley and crudely equipped horde of 80,000 was within eighteen miles of Mexico city. He was, however, decisively defeated on January 17, 1811, at the battle of Calderón.

Hidalgo fought for independence, liberty and social reform. Although he lacked the talents of a military leader and a statesman, his generation, with the possible exception of Morelos, evolved no greater or more constructive plan than his. The spirit of Mexican nationality may be said to date from his insurrection, for at his call thousands of Mexicans, particularly from the humbler strata, flocked to his standard. Over the towns which he conquered he set up his own councils. For the nation he planned to establish a congress "composed of representatives from all the cities, towns, and villages of the Kingdom, which should have as its principal object the maintenance of our Holy Religion and the passage of mild and beneficent laws adapted to the conditions of each community." He planned to banish poverty, encourage the arts and stimulate industry and to prevent the drawing away of Mexico's precious metals to Spain. His program was frustrated by death; but before his capture and execution he issued decrees freeing the slaves, declaring the equality of all Mexicans before the law, abolishing the tribute collected from the

Indians, reducing taxes and suppressing monopolies.

HIGGINS, HENRY BOURNES (1851-1929), Australian jurist. Higgins, the son of an Irish Methodist minister, came to Melbourne in 1870. There he studied at the university and was admitted to the bar in 1876. He was a member of the Victorian parliament from 1894 to 1900, when he failed of reelection because of his opposition to the Boer War. As a member of the Federal Convention of 1897-98 he opposed equal representation for the states in the Senate and advocated a greater degree of unification; unsuccessful in the convention, he agitated against the ratification of its proposals. He was a member of the first federal Parliament and federal attorney general in the short lived Watson Labour ministry of 1904, although he was not a member of the Labour party. He left Parliament in 1906 to become a justice of the High Court of Australia and in 1907 was made president of the Commonwealth Court of Conciliation and Arbitration. In 1921 he resigned the latter office after the passage of legislation which, he believed, seriously diminished the public usefulness of the court. He remained a member of the High Court, on which he worked with Sir Isaac Isaacs to widen the area of commonwealth powers.

Higgins is chiefly known for his work in the Arbitration Court, described in his *A New Province for Law and Order* (London 1922). He looked upon the court as a desirable application of the principle of substituting reason for economic force. His doctrine of a minimum wage based on the cost of living was the foundation of his entire arbitration policy. He felt that this cost of living, determined with reference to "the normal needs of an average employee regarded as a human being living in a civilized community," should be arrived at by statistical studies of carefully selected budgets of workers' families. In the absence of such studies, however, he attempted in the famous *Harvester* judgment of 1907 to set a standard of living in accordance with the evidence of the expenditures of women of the laboring class, although not entirely over-

looking the capacity of industries to pay. The standard of living fixed in that case has remained the basis for the calculation of the minimum wage in Australia.

G. V. PORTUS

Consult: Palmer, Nettie, Henry Bournes Higgins, a Memoir (London 1931).

HIGHER CRITICISM. In distinction from "lower," i.e. textual, criticism higher criticism seeks to understand the origin and development of Jewish and Christian sacred writings. While its beginnings as a science are coincident with the rise of modern historiography, use was made of some of its data and methods by early churchmen in their efforts to define the developing New Testament canon and by heretical groups in conflict with orthodoxy. Critical tendencies in the mediaeval and early Protestant periods were likewise inspired and limited by religious considerations. Thus Luther's rejection of the Apocrypha and certain New Testament writings was religiously motivated. The Renaissance with its great veneration for ancient literature, the Protestant Reformation with its doctrine of the sole authority of the Bible and the orthodox Protestant dogma of literal inspiration reenforced the traditional explanations of the origin and unity of the Scriptures. Yet the effort of Protestant scholarship to establish the original text did much to undermine belief in literal inspiration and so prepared the way for higher criticism. More important sources of the development of critical study were the rationalism of the seventeenth and eighteenth centuries and its conflicts as well as those of Catholicism and Arminianism with orthodox Protestantism. The philosophers Spinoza and Hobbes, the Catholic Richard Simon and the Arminian Grotius laid the foundations for the new science while the Catholic physician Jean Astruc first discerned the composite character of the Pentateuch. The rise in the eighteenth century of the aristocratic ideal of life with its religious tolerance and the founding of new universities under state rather than ecclesiastical control with consequent freedom of research in religious subjects, as at Halle and Göttingen, gave further impetus to the movement. Pietism combined with rationalism to prepare Protestant scholarship for participation in objective Biblical studies; like rationalism Pietism sought the basis of authority in the individual rather than in an external and social code, while unlike rationalism it maintained a constant interest in the Scriptures. Under these influ-

ences Semler, Ernesti, J. D. Michaelis and other Protestant scholars continued the work of Biblical criticism during the latter half of the eighteenth century. Lessing, Bishop Lowth, Alexander Geddes and Herder influenced by the literary revival contributed to the understanding of Biblical literary forms; and Schleiermacher's reorientation of theology created conditions favorable to the further development of critical studies.

In the nineteenth century the acceptance of a developmental view of history and the rise of the new historiography inaugurated a new era in higher criticism. De Wette and Eichhorn carried forward the study of Old Testament sources by means of historical as well as literary methods while D. F. Strauss, F. C. Baur and Ernest Renan applied to the New Testament the views of historical development suggested by Hegelian or positivist philosophy. If the hypotheses based on these or later evolutionary philosophies were sometimes discovered to be inapplicable to the data, they led in other instances to verifiable insights. Thus the Hegelian theory led to a complete misunderstanding of *Mark* but pointed out the decisive importance of the difference between post-Pauline and pre-Pauline thought. Comparative studies in mythology and folklore, dependent also on philosophical theories of uniform stages of development in divergent cultures, produced interesting speculations about the historicity or mythological character of Biblical heroes such as Abraham or Jesus or about the origin in totemic tabu of certain Old Testament laws. More enduring gains for the understanding of the history of Biblical literature accrued from the use of the data and methods of the new sciences based on the evolutionary view, particularly of sociology, ethnology and anthropology, and from the study of the larger oriental and Mediterranean environment with which this literature was closely related. Of particular importance were the archaeological and ethnological studies which led to the knowledge of early Semitic religion; the discoveries of cognate oriental documents, such as the Code of Hammurabi, the Tel-el-Amarna tablets and the Oxyrhynchus papyri; the study of non-Biblical Jewish writings—especially the apocalyptic and rabbinic literature—and of the Hellenistic mystery religions. Kuenen, Wellhausen, W. R. Smith and Hermann Gunkel applied the historical method which the evolutionary approach and the new data made possible to the Old Testament, while H. J. Holtzmann, A. Harnack, J.

Weiss, A. Schweitzer and B. Bacon were among those who dealt most effectively with early Christian literature.

Literary criticism, continued in connection with these historical studies, established the composite character or at least the editorial redaction of most Biblical writings. The editorial combination of older documents was first recognized and analyzed in the case of the Pentateuch with its four main sources. Underlying literary sources have also been traced in the historical books; in the prophets, particularly *Isaiah* with two or three component parts; in *Psalms* with its hymn collections from various periods of Hebrew worship; in the Gospels of *Matthew* and *Luke* with their common reliance on two main sources, of which *Mark* is one; in *Acts*, *11 Corinthians* and in other writings. Source analysis made possible the discrimination of editorial additions while linguistic and historical studies led to the discovery of ancient folklore elements, songs and laws, embedded in the sources themselves. The effort to distinguish preliterary sources has been markedly successful in the analysis of Old Testament writings and is being applied also to the study of the Gospels. The demonstration of the composite character of sacred Scriptures as well as other evidence has made impossible the acceptance of the authorship traditionally associated with many books, but criticism has led to conservative results in a few instances, as in the case of the major Pauline Epistles. The chronological and historical organization of the material so discriminated has been undertaken by means of reference to cognate oriental documents, to the prophetic movement, which is generally accepted as the source of Hebrew monotheism, to *Deuteronomy* as the product of this movement and the basis of Josiah's reform in the seventh century B.C., to the ritualistic and legal developments beginning with *Ezekiel* and to the connection of the book of *Daniel* with the Maccabean revolt in the second century B.C. In the case of the New Testament recognition of the Gospel of *Mark* as the oldest Gospel, of the presence of the apocalyptic element in Jesus' teaching and of the character of the changes involved in the evolution of the faith from a Jewish to a Greco-Roman religion has been of similar value.

The general result of the process of analysis and organization may be summarized as the acceptance and understanding of both literatures as the social products of the two religious groups and as the reflection of their history.

With its demonstration of the historical relativity of religious ideas and mythologies, previously accepted as absolute, higher criticism has been an important factor in releasing men from the authority of traditional forms. By applying the conceptions and methods of the evolutionary approach to the very standard which traditionalism opposed to the principle of development it contributed to the general acceptance of that principle, while the active conflict within religious groups over its methods and results tended to give wide dissemination to the evolutionary concepts involved. The loss of the absolute Biblical standard led within religious circles to ever renewed attempts to define the meaning and content of religion by means of a rational or empirical and contemporary approach. Criticism's concentration of attention on the historical movements connected with prophetism and the historic Jesus also affected religion profoundly.

While higher criticism has been called a "primarily Protestant phenomenon" it has flourished also among Catholic modernists, of whom Loisy must be especially mentioned, and among liberal Jews. It has been cultivated primarily in institutions not under direct ecclesiastical control and has been either rejected or accepted only with hesitation and has been distorted by its application to apologetic and polemic purposes by Catholic, Protestant and Jewish orthodoxy. The antithetic distortion of its methods and results has characterized its use by antireligious groups or individuals. Developed most highly in Germany, where theological faculties were free from direct ecclesiastical control, its findings were resisted for a long time in England and America, not without the additional animus to which political conflict at times gave rise. Accepted first in America by eastern and urban sections of Protestantism, the conflicts which arose over it were complicated by the intrusion of sectional and economically influenced thought patterns; while in Judaism similar social factors, including those connected with the relative adjustments to new environment of earlier and later immigrations, affected the acceptance or rejection of its methods and results.

HILDEBRAND, BRUNO (1812–78), German economist. Hildebrand first studied theology but soon turned to the study of history and economics. He was appointed lecturer at the University of Breslau in 1836 and professor at the University of Marburg in 1841. Forced to leave the country on account of political differences with a reactionary government, he fled to Switzerland, where he taught first at the University of Zurich and from 1856 at the University of Berne. While in Berne he founded the first statistical bureau in Switzerland. In 1861 he returned to Germany as professor at the University of Jena and director of the statistical bureau of Thuringia.

Hildebrand was one of the founders of the historico-ethical school of economics. He rejected the attempt of the classical school to set up natural laws in the realm of social development and conceived economics as a science of culture (*Kulturwissenschaft*) based on historical observation and statistical measurement, the purpose of which is to trace the actual course of economic development, to appraise it in the light of the ethical and cultural standards of the time and to point out ways and means of raising society to ever higher levels of development. In his well known stage theory he distinguished a natural, a money and a credit economy. Through his monographs he inaugurated exact research in economic history and through his statistical seminars in Berne and in Jena he promoted the cultivation of statistics as a tool in scientific inquiry. He put ethical considerations in the forefront of economic discussion; but he sharply opposed the remedies proposed by socialism, which, he believed, would increase rather than alleviate human suffering.

Hildebrand's views influenced the work of the younger historical school, as represented by Schmoller and others, and of the socialists of the chair, like Brentano and Wagner. He prepared

the way for many social reforms, which he propagated in the *Jahrbücher für Nationalökonomie und Statistik*, founded by him in 1862, and was instrumental in the organization of the Verein für Socialpolitik in 1872.

HANS GEHRIG

Important Works: *Die Nationalökonomie der Gegenwart und Zukunft* (Frankfort 1848; new ed. by Hans Gehrig, Jena 1922).

HILDRETH, RICHARD (1807–65), American historian, economist and publicist. Trained for the law, Hildreth became the chief editorial writer for the Boston *Atlas* and contributor to numerous periodicals. He stimulated Whig opposition to the annexation of Texas and advocated temperance and the abolition of slavery. In 1836 he published *The White Slave, or Archy Moore, the White Slave* (Boston; new ed. New York 1855), reputed to be the first antislavery novel. He opposed the Whig stand on the bank question, advocating open competition in banking privileges and unlimited right of note issue. After his retirement from active journalism Hildreth turned to philosophy and history and published two volumes of a projected series on the science of man, *The Theory of Morals* (Boston 1844) and *The Theory of Politics* (New York 1853), which although unoriginal are significant for their acceptance of the idea of evolution in morals and for their attempt at a scientific sociology.

Hildreth's best known work, *The History of the United States* (6 vols., Boston 1849–52; rev. ed. New York 1877–80), covers the period from the beginnings down to the Missouri Compromise. It is remarkable chiefly for the iconoclastic, unflattering pictures of the Puritan fathers in the early volumes and the passionate federalism of the later. Hildreth, the first realistic American historian, wrote: "It is due to our fathers and ourselves to present for once . . . the founders of our American nation, unbedaubed with patriotic rouge, wrapped up in no fine spun cloaks of excuses and apology, without stilts, buskins, tinsel, or bedizzenment, in their own proper persons." Volumes four to six, covering the years 1789 to 1821, are pervaded by animosity toward Jefferson and his democratic principles

but are otherwise thorough and accurate and are valuable for their emphasis on economic influences.

HILL, JAMES JEROME (1838-1916), American railroad magnate. Hill was born in Canada and emigrated to the United States in 1856. He worked as a clerk in St. Paul for several years, then became an independent shipping agent and commission merchant. In 1878 Hill and a group of associates bought at a low price the bonds of the St. Paul and Pacific Railroad, which had failed in the panic of 1873 mainly because of reckless financing and exploitation by its promoters. Hill reorganized the poorly built railroad then extending only 500 miles, developed it into the Great Northern system of 4000 miles and became a millionaire. He consciously based his business plans on the agricultural and industrial development of the American northwest and its transportation needs, concentrated his interests in that region and planned to monopolize its railroads. He participated in the syndicate promoting the Canadian Pacific Railway, which was subsequently linked up with the Great Northern. In 1889 he tried to secure control of the Northern Pacific Railroad but failed. His opportunity came with that railroad's bankruptcy in 1893 and its reorganization by J. P. Morgan and Company; as public opinion was against consolidation of competing lines, Hill and his associates bought stock in the reorganized Northern Pacific to bring the two railroads together by the device of placing practically a controlling interest in both companies in the hands of the same parties. By 1900 he was in control of a system of 10,300 miles. He extended the system west and south to the Pacific coast, with a steamship line to China and Japan, and strove actively to develop Asiatic markets for American trade, particularly for the products of the northwest.

As his interests broadened to include directorships in banks and insurance companies, Hill became one of the most important figures in the Morgan system of community of interests. Rivalry between the Hill-Morgan and Harriman groups led to a struggle for control of the North-

ern Pacific Railroad which precipitated the disastrous stock market panic of 1901. The rival groups merged their interests in a holding company, the Northern Securities Company, dissolved in 1904 by decision of the United States Supreme Court—a decision which destroyed the possibility of using holding companies to create legal monopoly.

Hill combined an unusual grasp of practical railroad problems with a flair for ruthless competition and acquisition. In the Great Northern strike of 1894 he rejected arbitration and called for state troops to suppress the strikers. He opposed effective regulation of the railroads; behind regulation, he believed, loomed public ownership and socialism. Hill's ideas, characteristic of an age of expansive capitalism, are incorporated in his book *Highways of Progress* (New York 1910).

HILL, OCTAVIA (1838-1912), English housing reformer. Octavia Hill was a granddaughter of the sanitarian Dr. Southwood Smith and as early as 1852 taught with her sisters at the Ladies' Guild managed by her mother. There she came under the influence of Maurice and later of Ruskin, for whom she copied pictures. She had become increasingly conscious of the evil effects of existing housing on the health and morale of the working classes, and she decided that living conditions could best be improved by putting the management of tenement property in the hands of educated women. In 1864 she began her new plan through Ruskin's help with the purchase of three residential courts. While her aim was primarily to interest the tenants in improvements and she insisted on adequate space per family, following Ruskin's advice she made the properties self-supporting. As a result "philanthropy and 5 percent" became popular enough to enable her greatly to expand her work. After twenty years she was made the manager of the dwellings of the Ecclesiastical Commissioners in the slum areas of south London and with her trained assistants, who might now be called social workers, she was managing over five thousand houses. The city of Edinburgh borrowed her methods and they were copied on the continent and even in America. Today members of the Association of

Women House Property Managers formed by her pupils and coworkers have charge also of crown and even of county council properties.

Like her sister Miranda she was a leading member of the Commons Preservation Society, which has kept intact some of the commons and open spaces in and near London, and a founder of the National Trust for Places of Historic Interest and Natural Beauty. She was an early member of the London Charity Organization Society and in general she preferred voluntary action to state aided policies. She served as a member of the Royal Commission on the Poor Laws from 1905 to 1909 and signed with reservations the majority report.

HILL, SIR ROWLAND (1795-1879), English postal reformer. Hill was the son of a poor schoolmaster and became a teacher when very young. In a school that he established with his brothers at Hazelwood he instituted a novel system of pupil self-government which was widely imitated both in England and abroad. For a time he was in touch with Robert Owen and was interested in developing a model agricultural community. He founded a society to promote inventions and invented a rotary printing press. But Hill is best known for his part in the introduction of penny postage. During the seventeenth century postage rates had been increased until the postage on a letter from London to Edinburgh was one shilling and fourpence. Members of Parliament and many other officials enjoyed the franking privilege, and the high rates fell chiefly on those least able to bear them. Hill proposed prepayment by means of an adhesive stamp and argued that the distance a letter was carried had little or nothing to do with postal costs. After much opposition from the government and the post office department, whose permanent officials greeted his plans for postal reform with ridicule and contumely, Hill's suggestions were adopted by Parliament in 1839 and put into operation the next year. Hill ac-

cepted a temporary position at the Treasury, which exercised a controlling influence over the post office, and was eventually appointed chief secretary. Opposition to his projects declined steadily and he introduced many reforms in his department, including the principle of promotion by merit. The lower postal rates resulted in an enormous increase in the number of letters carried and gross and net revenue increased considerably, although not so much as is popularly imagined.

HINCMAR OF REIMS (c. 806-82), archbishop of the see of that name. He was the dominant figure in the government of the West Frankish Kingdom under Charles the Bald and as such was one of the most important political and ecclesiastical figures of the ninth century. He is one of the best representatives of its normal political ideas and principles, which are, like all the normal concepts of the Middle Ages, plain and intelligible today. To Hincmar the purpose of political society and government was the maintenance of justice; that is, he represents the tradition of Cicero and the stoics, the tradition of the Roman law and the main tradition of the Christian fathers. Indeed it is noticeable that he expresses his judgment in the terms of the famous phrase of St. Augustine, "Remota itaque justitia, quid sunt regna nisi magna latrocinia," passing over in silence the unhappy attempt of St. Augustine to eliminate the conception of justice from the definition of the state. He was also directly influenced by St. Isidore of Seville's classical distinction between the king and the tyrant. He represents then, in the first place, the inheritance from the ancient world. But, in the second place, he also sets out very clearly the fundamental principle of the Middle Ages that the king is under and not over the law and that this law expresses not merely his own will but the general consent of his faithful subjects, thus asserting that conception which most sharply distinguishes the political civilization of the Middle Ages from that of the Roman Empire.

Finally, as an ecclesiastical statesman he represents the normal position of the ninth century, that the spiritual and the temporal powers were separate and independent of each other, while

in many details the two jurisdictions might cross. The king had his place in the appointment of bishops, and the bishop in the election and coronation of kings. The disastrous conflict of the two authorities which filled western Europe with chaos and confusion from the eleventh to the thirteenth centuries was yet undeveloped.

HINDUISM. See BRAHMANISM AND HINDUISM.

HINOJOSA Y NAVEROS, EDUARDO DE (1852-1919), Spanish legal historian. Hinojosa was educated at the universities of Granada and Madrid and became a professor of Spanish law and later of Spanish ancient and mediaeval history at the latter institution. He was a member of a number of learned societies, including the Academia de Ciencias Morales y Políticas.

Hinojosa is an outstanding figure in the history of Spanish law. He represented the tendencies of the German historical school and introduced into Spain the methodology of modern comparative legal history. A group of his disciples founded the *Anuario de historia del derecho*. His writings show a solid juristic background, a thorough knowledge of the investigations carried on by all the leading scholars of central and western Europe in the field of legal history, a mastery of the auxiliary sciences and an ability to interpret and evaluate unpublished documents.

Hinojosa's intellectual life may be divided into two periods. At first his primary interest was Roman law and later he became absorbed in the study of Germanic institutions; but his interest in both fields was always from the point of view of Spanish law. To his Romanist period belong the *Historia del derecho romano según las más recientes investigaciones* (2 vols., Madrid 1880), a

popular work based especially upon the research of modern German students, and a treatise on the reception of Roman law in Catalonia published in *Mélanges Fitting* (2 vols., Montpellier 1907-08, vol. ii, p. 391-408). His *Historia general del derecho español* (Madrid 1887, 2nd ed. 1924), which ended with a discussion of Visigothic sources, was a valuable although incomplete survey and systematized the results of previous investigations of the history of Spanish law.

Far superior to these works were Hinojosa's contributions to Germanic law. In *El elemento germánico en el derecho español* (Madrid 1915) he defended the thesis of the Germanic character of Spanish mediaeval law in a masterly way, analyzing with especial care blood vengeance and other Germanic legal institutions. *Estudios sobre la historia del derecho español* (Madrid 1903) included papers on such interesting mediaeval institutions as the municipality in León and Castile and the denial of sepulture to debtors. It also contained an illuminating essay entitled "El derecho en el Poema del Cid" which made evident the value of literary sources for the study of a country's legal history. Hinojosa also wrote on the artificial fraternity and the domestic community. His most important work, however, was *El régimen señorial y la cuestión agraria en Cataluña durante la edad media* (Madrid 1905). Its chief topic was the relationship between the land system and social classes in Catalonia during the Middle Ages and it supplied a great deal of new information gleaned from local archives. Many of its conclusions shed light upon the general problems of European mediaeval law.

JOSÉ OTS Y CAPDEQUI

Other important works: *Los nuevos bronce de Osuna* (Madrid 1878), in collaboration with Rada y Delgado; *Influencia que tuvieron en el derecho público de su patria y singularmente en el derecho penal los filósofos y teólogos españoles de los siglos XVI y XVII* (Madrid 1890).

Consult: Ots y Capdequi, José, "Los más grandes cultivadores de la historia del derecho español" in University of Valencia, *Anales*, vol. iv (1923-24) 117-59; Sánchez, Galo, in *Revista de derecho privado*, vol. vi (1919) 161-64; Diego, Clemente de, in *Revista de ciencias jurídicas y sociales*, vol. ii (1919) 145-50.

HINSCHIUS, PAUL (1835-98), German jurist. Hinschius was professor at the universities of Halle, Kiel and Berlin. He took an active part in the struggle of the German government against the Roman Catholic church, the so-called *Kulturkampf*; called upon by the Prussian minister Falk, he assisted in drafting the well known May

laws of 1873. The national law of personal status of 1875 also owes much to Hinschius in form and content. This part of Hinschius' work cannot be regarded as of permanent importance; indeed, the *Kulturkampf* regulations have practically all been repealed.

Hinschius owes his enduring fame to his scientific work in the canon law. At first a close follower of Aemilius Ludwig Richter, he soon far surpassed him. Because of his rigorous scientific objectivity, Hinschius succeeded in penetrating the spirit of the canon law despite his own Protestantism. His reputation was firmly established through the publication of the *Decretales pseudo-isidorianae et capitula Angilramni* (Leipsic 1863), for which he had prepared himself through extensive travel in order to study sources. The first scientific edition of the false decretals, it is unsuperseded to the present day.

Hinschius' chief work, however, is the *System des katholischen Kirchenrechts mit besonderer Rücksicht auf Deutschland* (5 vols. and the first part of vol. vi, Berlin 1869-97). This was only part of a work the whole of which was planned to comprise the Protestant as well as the Catholic canon law, but even with respect to the latter Hinschius was able to complete only the subjects of hierarchy and church administration. Nevertheless, the work must still be considered as an outstanding achievement of European canonical jurisprudence. Hinschius' thorough training in law, history and philology, his rare knowledge of the source material pertaining to both the canon and secular law, and his powers of dogmatic exposition—all these enabled him to master his tremendous subject. He fulfilled the task he had set himself, which was to give a realistic and objective account of the process of the merging of Roman, Germanic and canonic ideas. Interesting both from the viewpoint of legal history and the general history of civilization, Hinschius' work may be regarded as the culmination for his age of the method of the historical school in the field of canon law.

EUGEN WOHLHAUPTER

Leipsic 1900) p. 90-97; Stutz, Ulrich, in *Allgemeine deutsche Biographie*, vol. 1 (Leipsic 1904) p. 344-60; *Die juristische Fakultät der Universität Berlin*, ed. by Otto Liebmann (Berlin 1910) p. 50-51, 387 and 421.

HIPPOCRATES AND THE HIPPOCRATIC COLLECTION. Hippocrates, "father of medicine," was born on the island of Cos about

460 B.C. Next to nothing is known of him and few if any of the works which bear his name can be his. There is in fact no adequate evidence that he wrote anything. His younger contemporary Plato mentions him but throws no light on him or his work.

The so-called Hippocratic Collection is a miscellaneous series of Greek medical texts, the nucleus of which was probably put together by a book dealer in the third century B.C. to meet the demands of learned buyers in the Alexandrian market. Accretions continued until the third century A.D. The constituent works vary in date from about 500 B.C. or a little earlier to about 250 A.D. The collection is variously divided, the number of its texts ranging from about 60 to about 100. They vary in viewpoint, motive and scientific value but all of them display an entirely rational and highly sophisticated spirit. These texts, which are the earliest complete scientific treatises extant, all exhibit the conviction that order reigns in nature and that the character of that order can be elicited by investigation.

The collection has always been treated by medical men with a respect amounting to reverence. The dignified Hippocratic oath, although certainly not devised by Hippocrates and probably not written before 200 A.D., is still a part of the initiatory medical ceremony in some universities. There are at least six pathological conditions described in the collection to which the name of Hippocrates is still attached in modern medical nomenclature. The most striking and perhaps the most ancient members of the collection are: *Airs, Waters, Places*, which is the first work on climatology; *The Sacred Disease*, which treats of epilepsy and contains a superb vindication of the scientific method; *Epidemics, Books I and III*, which includes the earliest clinical case notes now known; *Prognostics*, which is supplemented by *Regimen in Acute Diseases* and contains some of the most characteristic passages; *Aphorisms*, from which many quotations have passed into modern speech, such as "Art is long, life is short," "One man's meat is another man's poison," "Desperate diseases need desperate remedies"; *Wounds of the Head*, a fine surgical work which molded the standard of practise in those matters with which it is concerned until well into the eighteenth century; *Fractures, Dislocations, Instruments of Reduction*, which describes the so-called Bench of Hippocrates, an instrument of reduction still in use, and methods of reduc-

tion of dislocations, some of which are in accord with modern practise.

The Hippocratic method of medical treatment is that known as the "expectant method." The physician should merely assist nature and must be very careful that "his treatment shall at least do no harm." Few drugs are used and those in simple form. There must be no officious interference with, but a careful promotion of, nature's own tendency to healing.

Kind will be found in *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft*, vol. clxxx (Leipsic 1919) p. 5-20, 43-49.

HIRE-PURCHASE SYSTEM. *See* INSTALLMENT SELLING.

HIRSCH, BARON MAURICE DE (1831-96), German-Jewish financier and philanthropist. Hirsch was born in Munich but lived for almost his entire life in Paris. He acquired a great fortune in the fields of banking and railroad construction and later spent a large part of it in many constructive philanthropic enterprises. His purpose was to interest the Jewish population of eastern Europe in productive labor through a system of broad social aid. He helped support the Alliance Israélite Universelle in Paris; in 1873 he donated 1,000,000 francs to the schools maintained by the alliance in the Orient and eastern Europe and he continued to contribute large sums toward the work of this society. In the late 1880's Hirsch concentrated his philanthropic activities chiefly on the Jews of eastern Europe, especially on those in Russia. It was his aim by awakening in the Jewish population an interest in agriculture and handicrafts to improve their economic condition and to raise the general level of their living as well as to offset the prevailing notion that Jews are in general not suited to manual labor. He informed the Russian government of his willingness to donate 50,000,000 francs for the creation of a

broad network of Jewish agricultural schools and farms as well as trade schools and workshops, but because of stipulations by the Russian government the plan proved to be unfeasible. Having convinced himself of the impossibility of helping the Russian Jews in their own country, Hirsch decided on the organization of mass emigration in the form of colonizing groups which were to settle in Argentina. A special commission was organized by him in 1890 and sent to Argentina to investigate conditions and purchase large tracts of land. In order to interest the Russian government in his plan Hirsch dispatched a member of the British Parliament, Arnold White, into Russia and in the autumn of 1891 founded in London a special society, the Jewish Colonization Association (known by its initials, JCA) with a capital of £2,000,000 paid entirely by himself. This capital was augmented by Hirsch and later by his widow, Clara Hirsch.

According to Hirsch's plan in the course of twenty-five years over 3,000,000 Jews were to emigrate from Russia and to settle in Argentina; the colonists were gradually to pay back the loan advanced them on their land and implements, and this money was to be used for further colonization purposes. The Russian government, eager to rid itself of the masses of Jewish paupers, gave its approval to the JCA in 1892. The broad plan met, however, with unsurmountable obstacles in execution. During the first three years only about 6000 Jews were established in Argentina, of whom only one half actually settled in the colonies founded by the JCA in the provinces of Buenos Aires, Santa Fé and Entre Ríos. The main flow of the emigration turned not to agricultural Argentina but to the industrially developed North American states. Nevertheless, Hirsch's experiment served as a vital stimulus for the subsequent flow of immigrants into Argentina and for the creation of an important Jewish center in South America.

Hirsch carried out the same idea of interesting the Jewish population in physical labor in Galicia and in Bukovina, where in 1891 he established the Hirschscher Schulfond with a capital of 25,000,000 francs. The activities of this foundation consisted in organizing agricultural schools, trade schools and workshops, which in 1905 had reached the number of 48 with an enrolment of 7800 students. After the World War, as a result of the depreciation of the capital which was deposited in Vienna, the schools in Galicia were taken over by Poland and those in Bukovina by Rumania.

In 1891 Hirsch established in New York a special Baron de Hirsch Fund with a capital of \$2,500,000 to aid Jewish immigrants to the United States and promote the idea of physical work among them. Trade schools for the children of the immigrants, night schools for adults, children's homes, agencies for immigrant aid and shelter, were established by this foundation and agricultural colonies were founded in New Jersey and in Canada.

E. TSCHERIKOWER

Consult: Leven, Narcisse, *Cinquante ans d'histoire*, 2 vols. (Paris 1911-20) vol. ii, p. 347-70, 420-93; Dubnow, Simon, *Weltgeschichte des jüdischen Volkes*, tr. by A. Steinberg from the Russian, 10 vols. (Berlin 1925-29) vol. x, p. 190-94, 303-06; Straus, O. S., "Studies of Notable Men: Baron de Hirsch" in *Forum*, vol. xxi (1896) 558-65.

HIRSCH, MAX (1832-1905), German social reformer and labor leader. Hirsch was the founder of the German trade unions which were named for him and Franz Duncker. These unions had the same general character as the educational unions of artisans organized before the Revolution of 1848 by liberal politicians for the primary purpose of spreading liberalism among the working people. Although unions existed among the tobacco workers and printers, the labor movement was hampered by the laws against combination; these laws were abolished in Prussia in 1867 and an active organization of unions began. Liberals and Social Democrats struggled for political control of the newly formed unions. Hirsch published a series of *Workers' Letters* in 1868 in which he described the structure, ideas and activity of the English trade unions and urged them as a model for the German workers. The Social Democrats issued a call for a national organization of labor unions; Hirsch issued another call, in the name of some unions under liberal influence, for the establishment of trade unions on English lines—that is to say, unions organized for cooperation between labor and capital instead of on the basis of the class struggle. The Social Democrats refused to permit Hirsch to speak at their congress, whereupon he called a general workers' meeting, which laid the foundation of the *Gewerkvereine*, the Hirsch-Duncker unions. Thus from the start the German labor union movement was split into rival socialist and democratic-liberal organizations.

The historic importance of Hirsch lies in his attempt to organize German unions on the English model attached to the liberal movement—a liberalism, however, which he insisted must rec-

ognize the workers' right to organize and develop their interests. The Hirsch-Duncker unions did not meet with any great response from the workers; at the very beginning the movement received a severe setback in the unsuccessful Waldenburg coal strike of 1869-70. This setback strengthened Hirsch's opposition to strikes and to unions as a means of struggle. It strengthened also his opposition to socialism; in 1876 he demanded that workers entering the *Gewerkvereine* must declare in writing that they were neither members of nor sympathizers with social democracy. Hirsch's opposition to socialism, his liberalism and insistence on class harmony were against the current of ideas among the workers; they created discord and hampered the development of the movement, aggravated by a rigid centralization which restricted the freedom of action of provincial and local unions. The *Gewerkvereine* were weakened also by Hirsch's opposition to compulsory old age and disability insurance, although he was generally strongly in favor of social reform. In consequence the Hirsch-Duncker unions gradually lost all significance, while the social democratic, or "free," unions came to dominate the labor movement.

Hirsch's most valuable accomplishment was in the field of popular higher education. The Humboldt Academy in Berlin, of which he was founder and general secretary, remains testimony of his activity in the labor education movement.

G. BRIEFS

Important works: *Der Staat und die Versicherung* (Berlin 1881); *Die hauptsächlichsten Streitfragen der Arbeiterbewegung* (Berlin 1886); *Die Arbeiterfrage und die deutschen Gewerkvereine* (Leipsic 1893); *Volks-hochschulen* (Berlin 1910).

Consult: Pache, Oskar, *Max Hirsch, ein Bild seines Lebens und Wirkens* (Bremerhaven 1894); *Aus der Humboldt-Akademie. Dem Generalsekretär Herrn Dr. Max Hirsch zu seinem 70. Geburtstage* (Berlin 1902); Gleichauf, W., *Geschichte des Verbandes der deutschen Gewerkvereine (Hirsch-Duncker)* (Berlin 1907).

HIRSCHFELD, OTTO (1843-1922), German historian. During his preparatory years at Königsberg, Bonn and Berlin Hirschfeld was deeply influenced by Lehrs, Friedländer, Ritschl, Jahn, Böckh, Droysen and Theodor Mommsen. He was initiated into the critical methods of philology and the new methods of research in inscriptions and became acquainted in Rome with the problems of topography and archaeology. In the auspicious period when because of Mommsen's genius for organization the vast material of inscriptions from the entire Roman world

offered itself as valuable source material for the deeper study of the organization and history of the Roman Empire, of its government and institutions, and especially of life in the provinces he concentrated with energy and skill, as one of the first independent followers of Mommsen, on Roman history. After 1872 he was professor of ancient history, first in Prague, then in Vienna and finally for thirty-two years at the University of Berlin, where as successor to Mommsen he contributed enormously to the enrichment of the field opened up by that scholar.

Between 1865, when he came to the fore with the first historical work on Roman municipal priests in Africa, and his death Hirschfeld published in nearly a hundred works studies on Roman tradition and Roman writers and on the political, military, social, economic, legal and administrative problems of the Roman state and its provinces, devoting special attention to the history of Gaul. Through this profound study of original documents concerning life in the Roman Empire he acquired the mastery over the material which allowed him to write early in life *Untersuchungen auf dem Gebiete der römischen Verwaltungsgeschichte* (Berlin 1877), which in 1905 reappeared entirely rewritten as his chief work, *Die kaiserlichen Verwaltungsbeamten bis auf Diocletian*. With the epigraphic method Hirschfeld penetrated into all fields of life; cautious, critical in detail, learned in the broad scope of his work, he reconstructed from a thousand fragments the structure of the organization of the imperial administration. Always analytical but never achieving a great historical synthesis, he was until his death a true disciple of the master of Roman history and of the organization of scientific work.

WILHELM WEBER

Consult: Kornemann, Ernst, in *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft*, vol. ccii (1927) 104-16; Wilcken, Ulrich, "Gedächtnisrede des Hrn. Wilcken auf Otto Hirschfeld" in *K. Akademie der Wissenschaften, Berlin, Philosophische-Historische Klasse, Sitzungsberichte*, vol. xxii (1922) xcvi-civ.

HIRTH, FRIEDRICH (1845-1927), German sinologist. After spending several years in the study of classical philology, in 1870 Hirth entered the International Chinese Maritime Customs Service organized by Sir Robert Hart. In the various localities in which he was stationed he devoted himself to a thorough study of the Chinese language and was especially attracted by the problem of the relations of ancient and

mediaeval China with the West, with central Asia and with the regions beyond. The result of his researches was the work *China and the Roman Orient* (Shanghai 1885), an investigation of ancient Chinese accounts of the Asiatic provinces of the Roman Empire. This work made Hirth known throughout the world of scholarship and led him to make further studies. In 1894 appeared the first part of *Die Länder des Islâm nach chinesischen Quellen* (T'oung Pao, vol. v, supplement, Leyden), which Hirth planned to make an extensive study of the subject and in which the Chinese texts concerning the caliphate at the time of its greatest expansion were to be collected and explained. Unfortunately the work progressed scarcely beyond the introduction.

After Hirth left the Chinese service in 1897, however, he published a series of historical works, such as the treatise "Über Wolga-Hunnen und Hiung-nu" (*Akademie der Wissenschaften, Munich, Philosophisch-philologischen . . . Classe, Sitzungsberichte*, vol. ii, 1899, p. 245-78) and "Sinologische Beiträge zur Geschichte der Türkvölker" (*Académie Impériale des Sciences de St.-Petersbourg, Bulletin*, 5th ser., vol. xiii, 1900, p. 221-61), and also turned his attention to the history of Chinese art and to Chinese archaeology. In 1896 he had published *Über fremde Einflüsse in der chinesischen Kunst* (Munich 1896), an essay which had received considerable notice, and in 1897 he presented a treatise *Über die einheimischen Quellen zur Geschichte der chinesischen Malerei* (Munich 1896; tr. by A. E. Meyer, New York 1917) before the Congress of Orientalists in Paris. From 1902 to 1917 he occupied the newly founded chair for the study of Chinese at Columbia University. His lectures in New York appeared in a volume entitled *Ancient History of China to the End of the Chou Dynasty* (New York 1908) and together with W. W. Rockhill he published a translation of Chao Ju-kua's "Description of the Barbarous Peoples" as *Chao Ju-kua, His Work . . . Entitled Chu-fan-chi* (St. Petersburg 1911).

Hirth's historical works have now been largely superseded, but he traced new paths for the investigation of the ancient history of central Asia and the extension of Chinese influence to the West. He was one of the first to bring into prominence the study of Chinese art.

HISTORY. *The Concept of History and Historical Analysis.* There is no branch of knowledge which in the course of intellectual evolution has exhibited more varied modalities and answered to more contradictory conceptions than has history. There is none which has had and continues to have more difficulty in discovering its definitive status.

History has its beginnings in the primitive representations which the mind made of the past. While physical phenomena would be known even without the intervention of someone to describe and classify them, the historical past exists only to the extent that there is an image of it—in other words, to the extent that it is recreated by the mind. The mind, however, can create as well as recreate. At first merely playing with the past, the mind came through the myth to attempt to take full and immediate possession of it. On the other hand, practical necessities have caused the particular circumstances of public and private life to be noted down. Genealogies, records, annals and chronicles register with more or less exactitude successions of names and events as guideposts for the memory. A sort of technique formulated by groping was in this way developed. Thus the entire development of history has a twofold source, or threefold if one takes into account the aesthetic pleasure derived from the playing of imagination and sensibility on the past, which explains the great number of easy and dangerous compromises between art and history.

The Greek word *ιστορία* originally meant research, exploration or information. Later it took on the connotation of the results of research, a verbal or written account. Through the Latin *historia* it passed into the Romance languages and most of the Indo-European tongues. In contrast with this Greco-Latin word there is the Germanic word *Geschichte*, which comes from *geschehen* (to take place, to happen). In the seventeenth century this word began to be used to designate a collection of historical data and in the eighteenth century such use became increasingly

frequent. In the nineteenth century *Geschichte* finally supplanted the term *Historie* and was used by German historians and philosophers to designate the collection of human facts and their evolution. In the twentieth century the term *Historie* is regaining ground.

In the etymology of these two words—history and *Geschichte*—may be noted two different points of view with respect to the past. With the use of the latter term the accent is placed on the event, *das geschichtliche Geschehen*; in the former on the evocation, the evocative effort. Doubtless the Germanic word has long permitted the double orientation of both the objective and the subjective aspect and signifies the *historiam rerum gestarum* just as much as it does the *res gestas* themselves, and similarly the Greco-Latin word is applied to facts objectively considered as well as to their subjective reproduction. But one of the terms denotes a more intuitive, the other a more critical tendency.

In the evolution of the discipline of history these two mental attitudes have not been without effect. There has been a tendency, an effort, to take broad possession of the past, to revive it by a play of the imagination or to penetrate it by a burst of speculation. Art and philosophy have variously falsified history for the artificial satisfaction or the vain amusement of the mind. And it was the natural survival of this naïve and spontaneous exercise that filled the world with myths falsely representative and explanatory. On the other hand, practical needs and the judicious desire for knowledge have established facts, collected solid masses of material and slowly created sure methods. But this work, scientific in appearance, is in reality only preparatory. True science meets with the same ambitions, seeks to solve the same problems, as were imposed on mythical thought and philosophical speculation.

In order to define the role played by history in the achievements of knowledge it must be noted that there exists for the mind a general point of view, which is the historical point of view, the

point of view of change. If everything in the realm of the real were subject to immutable laws, there would be no history. But neither would there be a possibility of history if everything in the realm of the real were universally and perpetually changing, if there were but chaos and anarchy. It will thus be noted that history is related to something which changes as opposed to or in connection with something which remains constant or repeats itself. And it will be noted also that in the broadest sense history comprises nature as well as humanity, as illustrated by such works as Cuvier's *Révolutions du globe* and Darwin's *Origin of Species* and *Descent of Man*. In its narrow acceptance, and it is in this sense that the term will be used here, history is the study of change in humanity. Many other definitions of history in the narrow sense have been proposed. Ernst Bernheim in his classic *Lehrbuch* says: "The science of history is that science which investigates and presents, in their context in psychophysical causality, the facts, determined by space and time, of the evolution of men in their individual as well as typical and collective activity as social beings." Henri Pirenne's more sober definition is: "The object of the study of history is the development of human societies in space and in time." The formula that history is the study of human facts of the past, although general and perhaps even a little vague, excludes no element of history and does not prejudice the result of the discussion to follow.

Among the ancients even in the case of those who were most eager for truth, even, for example, in the case of him who wished to acquire it forever, history was considered as a work of art, a literary genre. In the humanistic historiography of the Renaissance rhetoric placed in the service of politics or of morality played a greater role than the search for truth. And even in the nineteenth century, when in the romantic period history suddenly sprang into life and vigor, the part played by art was considerable: the imagination played too freely on insufficiently established facts. But this imagination—in its activities both picturesque and psychological—had advantages not possessed by rhetoric; and the historical sense which was being born in the absence of the critical sense, which was still scarcely awakened, caused the knowledge of the past to progress in the direction of the resurrection of environments and the fathoming of souls of peoples as of individuals. History as it is conceived today may blossom into art, may be crowned with philosophy; but it is primarily and necessarily the solid

establishment of facts and the precise exposition of the facts established, a task, as will be seen below, singularly difficult and delicate; in short, the pursuit and the expression of truth.

In contrast to the study of the present, which even in the case of phenomena is direct, the study of history is sometimes characterized by the indirect procedure to which it must have recourse. Of past facts there remain only traces, vestiges, monuments, documents. These monuments, which apprise the historian, these documents, which instruct him, are of all kinds; the sources of history, as has been said, are infinitely varied. There is an intentional tradition, oral, written, of determinate form, and an unintentional tradition. By a manifest paradox the documents and monuments of this last category—acts, letters, newspapers, various objects and material remains of public and private life—are frequently more useful to modern historians than the historical annals and chronicles of the first category, than the writings of most historians previous to the nineteenth century. It might be called "militant history," this history which by explorations, by excavations, pursues and recovers, sometimes at the price of painful effort and even danger, the disparate, scattered and often buried materials of history.

Inventories or indexes and depositories—archives, libraries, museums—of documents and of monuments have been formed. The so-called auxiliary sciences have come into being. Although attempts have been made to limit the number of these sciences, all sciences are or may be auxiliaries of history. Among them, however, may be distinguished those which as true techniques facilitate for the historian the pursuit and the utilization of the materials in which the past is to be found. Rules of criticism, external and internal criticism, have been derived from experience and reflection and allow him to disentangle from the texts more surely and more rapidly the sum or the parcel of truth which they contain.

The goal and accomplishment of scholarship are the finding and fixing of as many as possible of the infinite number of facts of the human past. And these facts accumulate to such an extent that especially since the beginning of the twentieth century the sentiment has at times been expressed that the mind will finally be overwhelmed by them and that furthermore the effort is vain, since no matter how huge and heavy is the mass of facts acquired, the totality of the past can never be reconstituted. To these

fears and complaints it has been replied that "history is not the accumulation of events of all sorts which have made themselves known" (Fustel de Coulanges); that doubtless not all facts are of equal interest and that there are details which "are of practically no importance in the total aspect" (Langlois); that the work of research and criticism must be regulated first to avoid useless repetition and then to proceed more directly to the essential point. There is scholarly work which is blind curiosity and there is scholarly work which is directed curiosity and constitutes true analysis. Pure scholarship is an end in itself; analysis leads toward synthesis. "Years of analysis are required for one day of synthesis," said Fustel de Coulanges and it is with this day in view that work should be performed.

The immediate result of the work of scholarship is included in monographs; and these monographs result in special histories. While monographs have been accumulating, the development of special histories has increased. Geiger lists some twenty-five special histories; the list could be increased. It is evident that the diverse manifestations of human activity, the various aspects of the life of men in society, can be studied separately. There are political history; economic history; history of institutions, political, legal, economic; religious history and ecclesiastical history; history of ideas, philosophical, moral, social; history of science, of literature, of art, of popular customs and traditions. But every country, every province, every town, every institution, every religion, every science, every literature, every art—even, in every literature or art, every genre, every school—has or can have its history. It is a process of breaking into tiny pieces, which can go on to infinity; and it is as a result of this process that the need for synthesis arises. If synthesis is illegitimate without analysis, true analysis is bound up with synthesis. A work of synthesis is thus pursued parallel to the work of analysis, and this work takes place under various forms more or less empiric or systematic.

Synthesis in History. Of the various forms of synthesis the most elementary form is the synthesis of erudition. The established facts are recombined with no other purpose than that of presenting them easily in dictionaries or encyclopaedias, in indexes or manuals. They are listed alphabetically or grouped according to subject matter. These instruments, precious to the historian, inform him as to the condition of the work. Certain bibliographical rubrics in publi-

cations, such as the general reviews, have been conceived in order to provide a periodical inventory of what has been done and what is yet to be done. Thus in the purely technical sphere it is sought to remedy the disadvantages of scholarship and to organize analysis.

But a more elaborate and moreover a current form of synthesis is the synthesis of reconstitution. Narration, which is spontaneous history and which in certain of the ancients and in certain historians of the early nineteenth century had achieved vigor as well as picturesqueness, stripping itself of all ornament, of all literary artifice and nourishing itself rather on the product of scholarship, is able to group in chronological series, to group effectively in works of a real value, a considerable number of well established facts. This kind of synthesis, which provides a more or less lively or pallid image of the past, does not aim to explain nor does it give any explanations except by chance. But works of this type, empirical as their construction may be, have an incontestable practical usefulness. They provide the mind with a first, indispensable contact with the past and are useful to other historians who aim higher than a mere recital of facts.

Synthesis of reconstitution has various degrees of extension and presents various modalities. It may embrace all of humanity—universal history, history of humanity, world history—or a people or only one period, one element in human life or in the life of a people. The term general history should be regarded with suspicion; it is used often but has diverse connotations. General history may be either a history which without being universal has a wide extension in space or in time or in both (*allgemeine Geschichte*) or a history which embraces the diverse elements of human activity or those of a people (*Gesamtgeschichte*). At times, and this is somewhat paradoxical but answers a special conception, it is a predominantly political history.

In synthesis of reconstitution historians have adopted two very different attitudes: that of political history and that of cultural history. From this division has resulted a struggle which has been vigorous especially in Germany in connection with the assault upon the theories of Lamprecht and which has not yet entirely ceased. To the idea that the state plays a preponderant role in the life of the peoples; that the acts of governments, the facts of internal policy, of diplomacy and of war constitute the core of history, there has been opposed the thesis that

the object of history is civilization; that is, a collection of facts on very different planes, among which economic and intellectual facts are of prime importance. Political history, direct descendant of that pragmatic history—so brilliantly represented by Thucydides, Polybius, Tacitus and Machiavelli—which is concerned with affairs, with the motives of statesmen, and which is orientated toward political action has lost some of its prestige. History tends to embrace life in the entirety of its aspect and thus to unite all the special disciplines and all the so-called historical sciences which have sprung from analysis. In all countries of high culture there has emerged since 1900 a movement oriented in this direction of synthesis. The *Revue de synthèse historique* provided it with a strong stimulus. A characteristic manifestation is the so-called new history in the United States and elsewhere.

Attempts at historical synthesis have often been prompted by a desire to construct a logical explanation for the development of civilization. They have assumed the form of that which Voltaire first called the philosophy of history, but which existed before him. Philosophy of history may be said to represent the transformation of the naïvely audacious burst of speculation of the old mythologies and the disentangling of the speculative element contained in the work of ancient historians by a series of thinkers beginning with Augustine. The philosophy of history has been characterized in the past by the effort to explain human events by going back to the source or sources of historic causality; but it has been characterized by an insufficient knowledge of facts, insufficient often not so much through the fault of the historian-philosopher as through the actual conditions governing the research. Finally and inevitably the explanation has been by its very nature too *a priori*; it has proceeded from a general philosophy rather than from the actual subject matter of history or it has been incomplete and one-sided because it has proceeded from incomplete observation of that subject matter.

The two schools which have represented this tendency in the broadest and most spectacular manner are the Christian and the German idealist. The former since the *De civitate Dei* of Augustine has attached the indefinite sequence of events to the divine will; the other in Hegel's system attaches it to the Idea or more exactly derives it from the Idea by dialectic. The materialistic conception of history is opposed to

both of these schools. They are magnificent but misleading constructions. The criticism which demolishes them, however, should not cause them or many other less broad conceptions to be despised. In all of them not only is implicit an invitation to understand, but also there remain ideas which may be put to valuable use. The exclusionism of explanations on the basis of the great man (the hero), of environment, of race or of ethnic genius cannot be accepted, but their every detail must not be rejected. Thus not the principle of the philosophy of history but the way in which it is practised is to be condemned. If the term is in bad repute it is because of the use which has been made of it; the concept is still legitimate.

Indeed in Germany especially the term philosophy of history is in fairly current usage. But a distinction is made today between *materiale Geschichtsphilosophie* and *formale Geschichtsphilosophie*. The one is traditional philosophy which pretends to disentangle the skein of history; the other is reflection concerning history, pure theory, and is often called also *Geschichtslehre* or *Geschichtslogik*. *Geschichtslogik*, properly a philosophy concerning history, has been held by many modern theorists to culminate in the negation of all true philosophy of history, in the submission under the influence of a false conception of science to the discretion of those engaged in the profession of history—scholars who establish the facts and narrative historians who assemble them. As used by Aristotle the word history contrasts research into the facts with the logical work of explanation. Also with Bacon, who furthermore follows the scholastics, history is that knowledge of the individual which is founded on memory as opposed to philosophy, whose instrument is reason. But modern theorists do not see history merely as a preliminary knowledge which furnishes the subject matter of the rational science; they see it as a science *sui generis*, which can have as its object only the individual and the non-recurrent.

The concept of a science of the individual seems *contradictio in adjecto*. Nevertheless, there are many theorists, both historians and philosophers, who contrast facts of succession and facts of repetition (Xenopol) or facts and laws (Naville) or singular and universal facts (Rickert). To the science of laws, or of the universal, various names are given: natural (Rickert), nomothetic (Windelband), systematic (Eduard Meyer), theoretical or conceptual (Croce); but all of these thinkers agree in distinguishing it

definitely from the "science of particular and individual things," which are characterized by their uniqueness in space and in time and which require merely that their causal connection be reconstituted. This is the narrow, unassuming conception to which has been applied the name of *histoire historisante*. In the case of mere change, however, no history is conceivable: the flow of things has an internal element of permanence. "Particulars carry generalities within them," said Ranke, and even according to Rickert the contingent permits elements of generalization. As a matter of fact the study of individuals, of various groupings, of peoples, of institutions, of creations of the mind, not only unites with them a more or less considerable number of phenomena but by a more or less conscious comparison is bound up with an entire set of psychological manifestations individual or collective. "Everyone knows that the basis of all human reasoning is a comparison. Even when we open our eyes and see, it is a comparison or a series of comparisons that we make without thinking of it. When we observe a historical fact, there always exists in our mind, even without our being aware of it, a term of comparison" (Fustel de Coulanges).

But traditionalist history performs other and more marked acts of generalization. From biological phenomena the evolutionary concept has so well penetrated into all classes of phenomena that every historian is led to posit directed, orientated developments with progressions and retrogressions and in doing so is followed by many others. In Germany the name *entwickelnde* or *genetische Geschichte* is given to history in which this preoccupation is evident. Under the name *Geistesgeschichte* a contemporary school assigns a preponderant part to the mind, to intellectual and moral evolution, but contrasts the understanding achieved by psychology (*verstehen*) with the explanation set forth by the natural sciences (*erklären*). On the other hand, an increasing number of historians emphasize the importance of the social element. Certain of them even see the possibility of distinguishing laws within it. But they transfer the laws of society from history to the natural sciences. Between nature and history they postulate a hiatus.

It is certain and cannot be too emphatically stressed that the natural sciences should not be roughly copied, arbitrarily transposed into history, as has at times occurred. Every science has its particular characteristics, a status appropriate

to its object. But humanity is bound up with nature. History cannot be an empire within an empire; it cannot escape certain principles which govern all knowledge. Scientific synthesis therefore, which constitutes the science of history, is the endeavor to generalize, to disentangle a complex causality in order to discover general factors without eliminating any of them a priori.

A conception of historical synthesis elaborated by discussion in the course of the past three decades has been constantly gaining ground and figures in some degree and more or less explicitly in the various undertakings of the new history. This conception seeks to profit from all the previous efforts of philosophers as well as of professional historians, to retain from the former whatever aims and elements are capable of survival and from the latter the results of their long and patient work, thus to rise methodically from the particular to the general with the aid of those who were in too great haste to do so. In other words, it attempts to found legitimate synthesis at once on analysis and on premature syntheses.

Causality in history is infinitely complex, and it is this fact which explains why history had such difficulty in constituting itself as a science. Causality is woven from very diverse elements, which, however, may be divided into three categories: contingency, necessity and logic. There are in history contingent phenomena, and it is on this point that the *historiens historisants* have especially insisted. Chance is the phenomenon which is the effect neither of a law nor of a will but of a coincidence of a series of independent phenomena and which thus is not and cannot be foreseen by the human mind.

Individuality is the sum of all the phenomena resulting from chance and relative to a human being, a collectivity, an epoch, a group or a crowd. Chance and individuality play an incontestable role in historical explanation and therefore synthesis profits from the labor of the most traditionalistic historians, those most refractory to the concept of science. Furthermore it has been realized that even in contingency there is stability. If chance is at the origin of individuality, whose characteristics are not infinitely variable but can be arranged under determined types, then individuality is found to be relatively an element of permanence.

There are also in history phenomena which come within the realm of science, phenomena of necessity. These are the institutional facts, those which lead to the organization of men in society.

In this organization there exist necessities, relationships which derive from the nature of things, laws. Institutions constitute in history a permanent element which sharply limits contingency. And the development of institutions, in fairly large measure, seems itself to be subject to laws. Therefore synthesis profits from the labor of sociologists. Sociology is a distinct discipline only in so far as it is a comparative study of institutions. It furnishes synthesis with the result of its comparisons, permitting synthesis more easily to segregate the social element of history and to define its role more precisely.

There are finally in history phenomena of an order which may be called logic—to avoid the word finality, which is in bad repute and inadequate. Deeply rooted tendencies and ideas most certainly form an element of primary value. Thought in individuals and in generations either weaves its thread continuously or repairs it when it breaks. It is there perhaps that the evolution of humanity finds its inmost, characteristic law. Therefore synthesis profits from the labor of the idealistic philosophers of history as well as from that of psychologists and logicians.

Such are the articulations of causality: contingency, necessity, logic. Three orders of facts—fortuitous and individual, social and logical—are the warp and woof of history and are so interwoven that they cannot be disentangled by science. And the essential problem of synthesis consists in studying the interaction of the three orders of causality, in seeking to discover in what measure logic penetrates the institutional and eliminates contingency.

In order that history may be truly a science the historian, however limited his task, must locate its position in universal history, must be conscious of its problems and to the extent that his work allows must be concerned with the role of the explanatory factors or at least of some definite factor. And in order that history may be truly a science it is also necessary that these explanatory principles be considered as directive hypotheses, until they make themselves felt unreservedly and result in accord among historians.

The laws of history will most certainly eventually be established, but in a different manner than has been conceived by some who have pretended to formulate them or by others who deny such a possibility. There is a tendency to apply the word law to the relationships of succession and of coexistence which present the greatest degree of extension and of constancy and especially to those which can be expressed by a

mathematical formula. But the absolute character of law is rather in the mind than in reality. If one leaves aside pure mathematics, which is, considered correctly, a construction of the mind, law is in reality only a general fact. It is not necessarily universal and eternal; it manifests itself in history; it can be created in history, a "function of the times." Generalities, similarities, uniformities, are equivalents of the word law although looser than the latter in its rigid connotation. Law is not an absolute; the general is a degree of law. All things hold together, are imbued with each other and clarify each other in the realm of reality. There is history in nature; there is nature in history.

Methodological Progress of History; Facts and Choice of Facts. The composition of history, it is said, is essentially the accomplishment of two operations: first to establish the facts and then to work them up. This was the procedure of Herodotus and Thucydides, of Fustel de Coulanges and Mommsen; so all historians proceed today. But while this statement is true it is only roughly so.

Establish the facts: this formula is too simple if one means by it essentially to recognize and demonstrate their authenticity. It would perhaps be satisfactory if history as conceived today were woven simply of events related in sufficiently numerous and explicit documents and if the entire problem consisted in picking out among these documents only those which are worthy of belief, rejecting the others for good and sufficient reasons and then with the events established by sure evidence composing "narrations of time past" as exact and precise as possible. Such was the case when history was concerned with the deeds of princes. Was a certain prince born at such a place in such a year? Did he at such an age marry a certain princess? At such a place did he achieve a decisive victory over a neighbor? "Establish these facts," then the formula has a clear, precise and simple meaning. But, for example, the progressive decline in the value of the *livre* of Tours from the time of Charlemagne to the revolution is not, properly speaking, an event. The decrease in salaries in the course of a certain period and the simultaneous general rise of the cost of living, these too are not events. But they are most certainly historical facts; and they are much more important than the accidental disappearance of a certain sovereign or the fall of a certain minister.

It is not valid to object that these are not facts

but collections of facts. Would then the assassination of Henri IV by Ravaillac in 1610 be a "fact"? If it is analyzed, if it is decomposed into its elements, material and spiritual, it is seen to be the combined result of general laws, of particular circumstances of time and of place, of circumstances still more special peculiar to each of the individuals who were at the scene of the assault at the time when "the event" occurred. It will then be seen clearly that a historical fact whether it concern a decision, an action or a human invention is never something elementary, a simple body. It is a complex, the elements of which must be dissociated. Furthermore the historical fact is by no means always "given." Very often the historian must in some degree create it with the aid of hypotheses and conjectures by delicate, impassioned labor. Moreover these facts are not apprehended immediately and directly. Patient scholars cooperating among themselves slowly establish them with the aid of thousands of judiciously questioned observations and thousands of pieces of numerical data, not "given" but extracted from the documents.

Such historical research inevitably involves the process of selection of fact; by what right, it is asked, in the name of what principle, would the historian make his choice? And is not selection the negation of an impartial, true and honest work of science? In reality, however, all history is selection—selection of the facts of the chance which destroyed en masse certain vestiges of the past or preserved others; selection of the deeds of man, which because of the abundance of documents necessarily summarizes, shortens, accentuates, eliminates; and finally selection of the facts created by the historian, of historical facts. To concur in the view that this is not a scientific attitude is to be ignorant of all science and of its conditions. It is to pretend that the histologist has only to put his eye to the lens of a microscope to discover immediately definite facts which can be utilized as they are, while in truth the essential portion of his labor consists in creating and interpreting the objects of his observation with the aid of singularly complicated techniques. In addition to histology, the science of nature, there exists also statistics, the impartial knowledge of figures and numbers. Statistics selects from among these figures and numbers, and only by manipulating with a directive hypothesis the data furnished by chance does the statistician increase the total of human knowledge.

What is of primary importance, what should direct all historical work, is the construction

and the bringing to light of comprehensive, planned programs of research. These programs should be the work of the most eminent historians who have reached the extreme point of research in their field, close collaboration with their colleagues. They must know the exact scope of the science which they are cultivating, what are its possibilities, what direction it should take and what definite questions it should first attempt to answer.

Supplied with his directive idea the historian seeks and discovers the indispensable documents; having discovered and secured them he criticizes them; having criticized and sifted them he explains them; having explained them he correlates them into homogeneous series, classifying the facts in each according to chronological order; and finally he examines the reciprocal relationships within this series: the continual actions and reactions—the interaction.

The Materials of History; History and Its Related Sciences. "History is made up of texts," said Fustel de Coulanges. While this is in one sense true it implies that where texts are lacking there is no history, that the concept of history is indissolubly bound up with that of written text to such an extent that before what is conventionally called the invention of handwriting there can be no talk of history. Contrary to this conception of history Leibniz at the beginning of the eighteenth century already affirmed that history should also be based on monuments and enumerated among these monuments, in addition to inscriptions and texts properly so-called, seals, coins and medals, drawings and pictures, ruins of buildings, dead bones and funeral urns, even languages, "the most ancient monuments of the human species," and fables and folk tales, "in which there is gold." The conception of a history founded solely on texts goes back to the time when historians considered the service of princes their essential end. As long as they retained as their primary concern internal and external politics of states, the primacy of the written document—of more or less official annals, of chronicles and histories often controlled by the rulers, of inscriptions, of charters, of diplomas issuing directly from kings or high personages—was a matter of course. But later historians studied institutions as such; then the total civilization of a group of men instead of two or three directing figures; and finally masses of peoples considered in turn in their political, social, economic and intellectual life (general and universal history). The conception of the written text as

the sole source of historical knowledge now appears as a relic of the past.

From this it follows that to the ancient and traditional list of disciplines which are included under the name of auxiliary sciences, which are not really sciences but techniques for the purpose of subjecting various categories of written documents to a preliminary treatment that renders them usable *de plano*, there must be added techniques of another order.

The list of traditional auxiliary sciences is well known. According to Leibniz the list was as follows. Chronology had as its purpose the furnishing of the historian with the means, as rapid and easy as possible, of translating into so-called absolute chronology dates given in relative chronology. Epigraphy was the codification of the contents of graven texts; palaeography that of manuscript texts. Diplomatics applied the rules of criticism to charters, diplomas, letters, registers and the like. Sphragistics studied seals and stamps. Numismatics at the time under discussion was not a science of coins, which it is tending to become; an indispensable auxiliary, even an integral part, of economic history, which had not been long in existence, it furnished above all portraits of princes and dates. These together with heraldics, which occupied a modest place, formed the first group of techniques indispensable to the historian of kings and their high actions.

Curious minds soon added to these tested disciplines others wider in scope or of different nature. There first developed the discipline of classical philology, which is devoted to the establishment and interpretation of ancient authors and to the criticism of texts. Then came that part of bibliography which is called historical bibliography and which first aimed to enumerate the best books on the principal periods or questions of universal history; it was soon transformed to teach the difficult art of utilizing the bibliographical instruments proper to assist historians. Then came antiquities, which through scholarly collectors introduced into history taste and the full understanding of the unwritten document. Finally there appeared a geography half philological, half historical, furnishing means of identifying the ancient names of peoples, of towns and of places or of tracing on maps the limits of states and of dioceses. This was a logical grouping: all these techniques covered exactly the field of the needs of a history defined by an almost exclusive concern for rulers and by a relatively restricted extent in time

and space. But the framework broke down in proportion as history was transformed or in proportion as hitherto minor techniques came into the ascendancy.

The transformations of history itself marked the disappearance of one of the auxiliary sciences most highly prized by old authors—genealogy. It is unnecessary to emphasize here the capital interest of this science for a history which was almost completely identified with kings, princes and their houses. As a matter of fact it is not exact to say that genealogy has disappeared. The truth is that it has seen itself gradually replaced by demography, a newcomer, which seems to have delayed its entrance into the world of history until the king of former times was replaced by demos, the sovereign of today, the modern object of the study of historians.

Many of these other disciplines have assumed the character of autonomous sciences but when utilized by the historian are transformed into auxiliary techniques. Linguistics and its various provinces, archaeology, geography, comparative law and other disciplines independent of history, whose number is ceaselessly increasing precisely in the measure that history itself annexes new territories, are continually being appropriated by the historian for his own use. History in proportion as it becomes more scientific enters into closer and closer relations with the other sciences, discovers similarities among their procedures and their methods and especially with increasing precision measures the close solidarity which unites it to them. The relations of history with psychology and sociology particularly have raised difficult questions. When sociology began to organize itself as a science innumerable controversies arose between ardent, ambitious sociologists and historians. The latter took active part in the disputes or affected to despise in sociology a reincarnation of old philosophies of history. But now it is most commonly agreed that the grouping of men in society creates an object of particular study; that from the interaction of individual consciousnesses there results a reality formed doubtless by individuals but not superimposed by them and none the less imposed on them; that this is thus a matter for special research, which naturally should not be conducted from an *a priori* standpoint—for example, from the standpoint of a constructive psychology making in advance decisions concerning social tendencies and needs—but, on the contrary, by determining rigorously with the aid of the sciences related to the various categories

of essential social facts the institutions by means of which great functions are accomplished. Of especial interest are the juridico-political function, which in the life of an isolated being outside all society would evidently answer no purpose, a fact which demonstrates its essentially social character; and the economic function, which seems to be a social organization and a powerful development of rudimentary individual needs.

It is well realized that between such researches and those of historians there are close connections as well as reciprocities and borrowings. The social functions, for example, are evidently subject to the action of historical contingencies; the contingencies, on the other hand, have to take into account the expressions of necessity, the social laws which limit their scope. But precisely what is the distinction between the work of the sociologist and that of the historian? The one exerts himself by concentrated work of comparison to detach specific necessities, to characterize and classify social types, to create their statics and their dynamics. The other utilizes the data furnished by sociology the better to understand and clarify the role of the social element in history; he knows, however, that besides the necessary—besides those laws which are explained above—and besides the contingent he will strike facts, logic, ideas; and he therefore avoids sacrificing to one of these three orders the other two. He thus, for example, eschews the adoption of a purely sociological interpretation of history, in which the social being is considered as an irreducible item of data, as the primordial source of all human facts. This is an act of prudence, which at once reserves and introduces a very great question, that of the role in the history of the individual—that “intermediary between chance and necessity”—and of his position at the various stages of evolution in relation to society.

One often hears a formula which is compelling by its very simplicity: “Psychology treats of the individual; sociology of the group.” More carefully expressed this becomes: on the one hand is the social, the particular object of sociology, the specifically social, the product of society as such (not the collective); and on the other hand are what are called individuals, including both the individual and the collective. This antithesis is dangerous, preserving as it does the common confusion as to what is social and what is collective. It leads naturally to setting not only social but also collective against individual. This is legitimate but always on one condition, that it

be not forgotten that under the term collective are grouped phenomena of heredity, of imitation, of contagion and the like, which are of the order of contingency and not of social necessity; and also, inversely, that in the heart of an individual consciousness the collective plays a very large part. Individuality is one and only one of the aspects of the individual. Besides the peculiarly individual traits there are inherited traits, and in this domain an immense field is still open to research particularly for those who are working to constitute a science of characteristics. There are also strictly collective traits. For example, can the mechanism of the memory (to remain in a domain familiar to the historian) be understood outside this collective framework of the memory, the importance of which has been well demonstrated and without which man would be incapable of reconstituting and of reliving his past?

The importance of a psychology devoted to the study of that which in current conceptions is called the individual (as opposed to the collective) is limited by collective psychology, whose progress alone will be able to determine any decisive progress of history. The problem of knowing how man, the actor of history, the agent of historical work, is made presupposes the existence of a psychology capable on the one hand of furnishing the historian with well combined actions of general types responding to human averages and on the other of defining with precision what in a certain person exceeds these averages or remains below them.

Periodization. There is no methodological problem of greater import within the field of history than that of periodization. It is not merely an exterior problem of arrangement and of disposition for the sake of convenience but a basic problem capable of receiving the most varied solutions; these, however, may be classed under two principal rubrics.

For those who attach primary importance to acts and consider history as a succession of events the problem is to know whether this succession, which appears continuous, is not in reality made up of a series of distinct pieces joined end to end, each retaining its unity; and whether there is not an advantage in considering it in this way. Large pieces may be considered to represent the traditional divisions of history into ancient, mediæval and modern; smaller pieces within the large are centuries, empires or reigns. Each of these is circumscribed by events which are promoted to the dignity of limits and con-

sidered as inaugurating or terminating distinct and in a certain measure autonomous phases of human evolution.

The defects of this conception are obvious. In the first place, it is valid only for European history, which appears less and less worthy of exclusive interest. Of what significance, for example, is the concept of the Middle Ages (only moderately clear as it is) as soon as one extends the limits of this Old World, this Christian and European civilization, which alone gives that concept meaning? If the contingent, the necessary and the logical all exist in history and if they must all be considered at once, the weakness of this system is that it is based entirely on the contingent.

At the opposite pole there are those who, impressed by the insufficiency and the puerility of this cutting up of facts into periods marked by definite or approximate dates, profess that in history much more importance should be attached to movements than to acts and that what is worthy of attention is less the succession of events than the continuous stream of men. The problem, they say, is not to segregate slices of facts between events which are said to mark limits, but in the perpetually moving mass of human beings to apprehend successions of groups filling the same office as the successions of periods. Thus there came into being, notably in the mind of Cournot, the theory of generations, taken up again by O. Lorenz and later by many others, which tended to substitute for periods secular or otherwise this living, human concept of generations begetting each other. Three generations fill about a century; a grandfather, who flourishes from 1500 to 1530, passes to his son, who flourishes from 1530 to 1560, a treasure of traditions and experiences in part inherited, in part augmented by him. And the son in turn transmits the balance sheet of his heritage and acquisitions to the grandson, who spans the generation from 1560 to 1590. Then a new cycle begins with the three generations of the seventeenth century succeeding those of the sixteenth.

This idea is attractive at first glance. It seems to preserve for the past the characteristic, so essential in life, of ceaseless development and renewal. It seems to solve by simple omission the absurd and irritating problem of dates and limits. Finally, it seems to substitute for periods—inoperative and artificial abstractions—a human and living reality. But it brings up innumerable difficulties. It is doubtful that the his-

torian of antiquity is capable of contrasting usefully the three generations which peopled Rome during the fifth century before Christ or that the historian of the Middle Ages can base anything at all on the particular and distinct characteristics of the three generations of the eleventh century—those of 1000, 1030, 1060. A Frenchman might feel capable of contrasting the two generations of 1660 and 1690, that of Pascal and that of Fontenelle. But do these generations resemble their contemporaries, the German, English, Spanish and Italian generations? In other words, is the contrast of the generations of 1660 and 1690 the same in these various countries as at Paris? And furthermore is it even the same at Bordeaux, at Marseille, at Brest as at Paris? Can the generation in fact be defined in such a way as to allow some illusion of the value of the concept to remain?

It is wise therefore to note simply this, that there exist in the history of human societies certain moments at which the concordant effects of a vast and simultaneous process are particularly apparent; when facts of various orders—political, economic, religious, intellectual—seem to be connected by a particularly strict bond; when, for example, it is at once perceptible that printing is becoming widespread and producing its first effects, that a new spirit and a new method, critical and rationalistic, are being manifested in those who are known as the humanists, that great discoveries are enlarging the known world and the horizon of ideas, that in the different nations of Europe the progress of royal power with its centralizing and unifying tendencies is being accelerated, that, finally, the first manifestations of the capitalistic system and spirit are beginning to make themselves felt. These are all facts which it is very difficult to dissociate and which working simultaneously on the men of certain countries at a certain epoch create in them a definite mentality easy to grasp and contrasting at once with past and future periods. And, on the other hand, between these periods of concentration there are periods of indecision, of dissolution, waste spaces of history in which the adventurous advance guards collide with the lagging rear guards. Are frontiers to be traced between these unstable, moving forces? This is the chimaera of dates and limits. But to seek what heralded and prepared for these momentary states of equilibrium, of temporary, impressive stability, or to discover what new elements are being progressively substituted for the old—this is a field of research which contains no element of the arbi-

trary, which can be applied equally well to all histories of all periods and of all peoples whether in the Orient or the Occident, in Europe or in America, in Asia or in Africa. There is no need to eliminate these old concepts which have become part of usage, antiquity, the Middle Ages, modern times, and which moreover by dominating the labor of scholars have acquired an incontestable practical value. History is a science of duration; therefore its division should be chronological. It is a science of man; therefore its divisions should also be looked for in man.

The Problem of Objectivity and the Concept of Universal History. Much has been said, since historians as well as detractors of history have existed, on the congenital infirmity of those bold spirits who take the human past as their object of study. Certainly in every science an element of confusion and disorder is always present in the results achieved, even in the work of the wisest. But when human societies are the subject matter this results in great complexes of complexes. The study of human societies is not only of an almost inconceivable diversity and multiplication of aspects but is of such a nature that no man, however balanced he may be, however determined to maintain himself on the line of strict impartiality, can ever escape from the thousand biases created in him by the many particular acquired or inherited traits of his personal nature. Nor can he avoid the influence of his own theoretical ideas concerning the relative value and the comparative role of the various factors economic or religious in the evolution of societies; or the secret influence exercised upon him without his knowing it by his nationality, his religion, his social position, his avowed or unconscious affinities with, for example, the bourgeoisie or the working class; not to mention the subtle and profound influences emanating from his historical environment, each one of them reflecting on to him in its way the general life of his time.

Against so many serious causes of error what precaution is possible? To preach criticism and impartiality, that the historian should remain as unmoved before human facts of the past as the naturalist observing the wing of a mosquito under the microscope or the astronomer viewing a familiar comet through the telescope? But by his very definition the scholar exerts himself with all his being toward impartiality; without it he excludes himself from the realm of science. It is not purposeful distortion by the partisan disguised as a scholar which is of supreme impor-

tance, but the unconscious involuntary distortion, the distortion which the bona fide historian does not even perceive, the error committed by him at the very moment when he feels himself the most rigorously impartial of all observers.

The only possible remedy consists in the progressive broadening of history, in the replacement of the idea of particular histories by the broad and salutary idea of a universal history, of which all particular histories are but chapters. For the final goal of the historian is not to make known certain groups of men at certain periods, but humanity in the totality of its representatives. This is yet of course but an ideal. How many historians are there working on the enormous task of establishing a universal history? Among these historians how many possess a clear vision of the goal to be pursued? And to what extent will those who do possess this vision be hindered by the lack of general organization of historical studies from drawing from it the desired reward? But this ideal does exist, and historians have it constantly before their eyes to inspire them in all their activities and to make them realize forcibly that all historical work should be "a contribution to the history of human societies in their totality," and that it will be valid in the measure that it is useful for the general knowledge of these societies. It is not a question of creating a school of universal historians, who in the present condition of research would necessarily be merely philosophers of history, rashly generalizing from a few discoveries and for the rest filling the gaps in our ignorance by preconceived theories. The same and modest essential is that all those performing historical work should have the precise feeling of the unity and of the ultimate objective of the science which they are cultivating and that each one should exert himself to enrich his patrimony.

Thus gradually the ideas of discipline, of subordination of individual view in a general direction, of internal organization of the work—these ideas inherent in every efficacious work of science will penetrate in their turn into history, will continue to assure its gradual transformation into a science conscious of its goal and of its means and notably will solve a capital problem, that of the objectivity of the historian. The various studies, all tainted by the very hands of their authors, by an important coefficient of error, of illusion and of personal blindness, will constantly control each other; the "involuntary biases" too will correct each other and to a large measure cancel out.

This is the certain reward to be derived from the practise of this comparative method, the possible benefits of which have been illustrated notably by Henri Pirenne and which historians will increasingly put to technical use. History in a closed circle is stupid. History can be a science only in the measure in which from being descriptive it becomes explanatory. Now explanation includes above all comparison; or, to put it more explicitly, how is one to describe correctly if one does not compare mentally? How is one not to be deceived, as was Fustel de Coulanges as to the true nature of the gens, if one has eyes only for ancient Rome?

HENRI BERR
LUCIEN FEBVRE

HISTORIOGRAPHY. *Antiquity.* Historical writing in the modern sense was hardly developed among the peoples of the ancient Near East. The discovery of writing and the beginnings of the measurement of time made possible the preservation of temple records, which form the first historical annals. The highly developed civilizations of Egypt and Mesopotamia produced nothing worthy of the name of history. The few short notices of the exploits of the Egyptian pharaohs and the few lists of kings that have been preserved were all prompted solely by an interest in glorifying the ruling monarch and the events of his reign. In Babylonia the original form of historical writing was the dedicatory building inscription. Among the Assyrians there developed the custom of preserving royal annals which recorded in chronological sequence the ruler's military and hunting exploits and his building operations. A critical faculty was non-existent and the purpose here also was to glorify the monarch for posterity. All disparaging facts were omitted, exaggerations were common and all the records were impregnated by the religious element. All events however commonplace they might be were regarded as effected by the divinity and all conquests and buildings were dedicated to it.

Of all the peoples of the ancient Orient the Hebrews alone developed a true historical sense. The historical portions of the Pentateuch, *Judges*, *Kings* and *First Maccabees* far surpass any of the other historical records of the ancient Near East, although the tendency toward an "undigested chaos" remains, a sound critical faculty is still lacking, legends and folk tales are confused with historical data and there is a marked prejudice in the selection of materials. There

appears for the first time a conception of history that goes beyond purely military records, and such questions as social development and the history of migrations are given due attention. The underlying purpose, however, is religious and didactic; historical interests in themselves remain of secondary importance.

The penetration of Greek and Roman influence into the Orient was largely responsible for the historical works of Manetho and Berossos as well as of Josephus. Manetho, a Hellenized Egyptian of the third century B.C., compiled in Greek a list of all the pharaohs and originated the system of grouping names according to dynasties. Berossos, a Babylonian priest of Bel, attempted in the same century a history of Babylonia based on existing records. The works of both of these authors, however, have been preserved only in fragments.

Real historical writing began with the Greeks. Mythology and miraculous accounts gave way to a more critical attempt at narrating events as they occurred. History was chiefly narrative and was regarded more as a branch of literature than as a separate discipline, a fact which accounts for the overemphasis on style and rhetoric so characteristic of almost all the ancient historians with the possible exception of Polybius. The historian was not simply the erudite scholar who weighed sources, consulted texts and balanced evidence; rather he was the practical man of affairs, who devoted most of his book to a description of events in which he himself had participated. Politics and military history were almost the exclusive subject matter. Beginning with the prose works of the Ionian city chroniclers and the work of Hecataeus of Miletus, Greek historiography reached its flowering in Herodotus, Thucydides and Polybius.

Modern critics are dubious whether Herodotus, the historian of the Persian wars, always understood strategy or tactics, and he certainly had not Thucydides' almost morose interest in chronology; but his survey of the world in which the Persian wars were fought, of the nations that fought them—their traditions, political and social ideas, growth and expansion—is a miracle of the art of story telling and for its breadth and truth invaluable to social historian, anthropologist and humanist. He drifts and digresses, "writing what he hears," and it was long before critics recognized him as a supreme artist and as the pioneer of the broadest and most modern treatment of history. Climate, diet, clothing, tribal usage, religious belief—all are within his scope but with

the Greeks' exquisite sense for proportion. Thucydides was the first to treat of politics with the grasp of a philosopher. He had the political instinct and had been in politics himself. He wrote the history of the Peloponnesian wars because he saw from the first that they would be significant. Human nature, he held, would never greatly change, and therefore a close and accurate record of what really befell would be forever valuable. He carefully divides his story into years, groups his subject matter and precisely narrates the military movements. His account of the revolution in Athens in 411 B.C., precisely charting the fluctuations of popular mind and mood, is a masterpiece. Xenophon has nothing like his grasp of political issues, of policy and national reactions. He can describe vividly what he has seen—the accounts of the return of Thrasybulus (a Garibaldi-like narrative) and the retreat of the ten thousand are alive from start to finish—but history in the large sense is beyond him. Polybius, although with much less art than Herodotus, writes the history of a later period in a manner somewhat resembling that of the latter. The son of a Greek statesman, long a political *détenu* at Rome, the lifelong friend of Scipio, the confidant of princes, a soldier and an explorer, he describes the Hellenistic Mediterranean world. He begins with a challenge to the reader; how is it that in fifty-three years, scarcely a lifetime, every political relation in the world is changed and Rome dominates all? Other men write histories of races and episodes—some, histories of the whole world—without realizing the significance of the West; they “knock off Rome in a couple of pages”; he insists on the meaning of Rome and her rise and makes it his task to show it the reasonable outcome of Roman character and polity.

The Romans made no original contributions to historiography. They were more interested in the practical use of history as a guide to statesmen and orators and as presenting models for conduct and action.

Dionysius of Halicarnassus and Livy both presented mere narratives of the antiquities of Rome. Livy was a born story teller, a lover of the past. But for all the art of his narrative, its value as a brilliant transcription of other men's works and its significance as an interpretation of Roman sentiment and patriotism, he is not a historian in the same sense as the major Greek historians. He is careless, uncritical and interested solely in glorifying the Roman national tradition. Dionysius writes at greater length and

less critically, with a constant reference to Roman usage and tradition.

A very common practise of ancient historians was to ornament their narrative with fictitious speeches delivered by the important characters. This practise was followed by Thucydides but became more popular after Isocrates and his followers developed the art of rhetoric. Thucydides used the speech very frequently to sum up the half intangible factors, as moderns phrase it, that make a situation; later historians wrote speeches of no probability or value for the sheer pleasure of rhetorical composition. Polybius commented caustically on these and on the historians who confounded tragedy and history. He wrote singularly few speeches in his history and these appear to be genuine; they are short and to the point. Tacitus was the master hand among the Romans in making literature of history, suggesting what he does not say, picturing character in brilliant phrase, tempering event with epigram. Ammianus Marcellinus in the fourth century A.D. similarly wrote a splendid history of his period in a Latin touched by late Greek rhetoric.

Economic, constitutional and intellectual history are almost entirely ignored by ancient historians. No modern historian of a great war could generally ignore finance, transport, commissariat and commerce; in Thucydides they are all touched upon, but the reader is supposed to assume them. It is debated today whether economic issues in politics, national or international, bulked as large then as they do now. An exception is the *Ways and Means* (*Poroi*), attributed to Xenophon, in which economic questions are considered and which is really the oldest extant economic tract. Nor does the ancient historian linger to say much of literature, art or religion. Herodotus once alludes to Aeschylus and once to Pindar. Thucydides mentions no philosopher, architect or man of letters as such; he implies art and drama and he has oblique allusions to religious belief which lead moderns to assume he had none himself. Yet in the speeches inserted in his history Thucydides speaks with emphasis of the rich intellectual life of Athens—particularly in the famous funeral oration of Pericles, which briefly yet fully surveys all the higher interests in which his countrymen excelled. No such epitome of a nation's life has ever been made, an epitome that illumines rather than enumerates. Later historians rarely attempted anything of the kind.

Another type of history achieved in the Greek

world was that of the short biography of the significant individual who makes history. The *Evagoras* of Isocrates, the first example of this genre, was immediately eclipsed by Xenophon's *Agésilas*. The influence of this development is seen in Polybius, but its great exponent is Plutarch with his long and most delightful series of *Lives* of famous Greeks and Romans. The most widely read document of the kind is undoubtedly the *Gospel of Luke*, which as a work of art owes its scheme to Isocrates and recalls at once the reserve of Thucydides and the human feeling of Herodotus.

An interesting problem in ancient historiography is that concerning the equipment and qualifications of the ancient historian. It is clear that Eusebius, living about 325 A.D., had a large library to draw upon and probably secretaries to do some of his transcription and perhaps some of his selection. Josephus had assistants who attended to his style, and their hands are distinguishable in his work. But it is difficult to know how Herodotus and Thucydides gathered and preserved their memoranda. Parchment and paper were not invented; earlier writing materials must have been bulky and very expensive. Probably memory played a larger part than today. Collections of decrees (*psephismata*) and the like were sometimes available but scarcely sufficient in themselves. Sometimes, as with Tertullian's citation of Pilate's rescript on the crucifixion, the document seems to have been inferred rather than seen. Polybius quotes monuments that he appears to have seen; Livy refers to one that he did not trouble to inspect; Tacitus improves the Latin of an inscription he quotes. The conditions of book construction saved ancient historians from prolixity in footnotes, references and appendices; they had to jettison their notebooks and tell their story. Forgery, myth and legend, especially where early history or outstanding personalities were concerned, put the ancient historian on his mettle. Some merely rationalized the fable by leaving out the improbable elements; others saw more clearly that such a procedure was vague and uncritical. Not all reached the level of Eratosthenes, who suggested that the map of the real travels of Ulysses would be made when the cobbler was discovered who stitched the bag in which Aeolus tied up the winds. Marvels, portents and miracles each handled as he saw fit; but their total omission does not necessarily make a historian's work more faithful as a representation of the contemporary mind. Of all ancient historians Polybius is the

one who most often and most freely discusses the historian's art. He is clear that a man must have done the thing he is to write about; he must have traveled and seen, he must have borne his part in the political life of his country; Timaeus on his sofa for thirty years in Athens is no model for historians. Polybius is not alone in recognizing that a historian has to understand personality, but he has an almost Carlylean realization of what a single man, a hero, may do. He recognizes also that if history is to teach anything, if it is to have its value as an interpretation of human experience, the great essential is truth.

T. R. GLOVER

Mediaeval Europe. Mediaeval European historiography is characterized by its assumption of the universal cogency of the Christian religion. It is more universal in scope than ancient classical historiography and in its beginnings is frankly controversial against the still surviving paganism. The mediaeval philosophy of history finds its best expression in Augustine's *De civitate Dei*. Augustine with pronounced propagandist aims set himself to trace the finger of God in all the confusion of the contemporary Roman world. His first ten books are devoted to the refutation of those who had contended that Christianity was responsible for this world ruin. He shows, with great learning and with a wealth of illustrative material from standard Roman authors whose works have since been lost, how the Assyrian Empire had lasted longer than the Roman and how Rome itself had been sacked in earlier days by the Gauls and had constantly been drenched in blood by fratricidal strifes. In all this its gods had been of no avail. He then proceeds to show how all these events were really providential; that Rome's conquests had resulted in the survival of the fittest and that the Roman Empire had welded the world into one so that Christ might be born into it and Christianity might inherit its universal dominion. Thus it may be said that Augustine distinctly implies the idea of progress through the ages. The main ideas of the *De civitate Dei* dominated the whole western world during Augustine's own time and for at least a thousand years after.

The interest in universal history goes back before Augustine's time to Sextus Julianus Africanus, a distinguished soldier and a Christian, who about 220 wrote a universal history, of which only fragments embedded in later authors remain. Eusebius of Caesarea (c. 265-340) writing in Greek followed in the footsteps of Africa-

nus. He took his material for a world history partly from him and partly from other authors. Eusebius moreover developed the system of chronology which became the basis for all subsequent mediaeval historians and chroniclers. The chronicle of Eusebius was translated into Latin by Jerome (c. 400) and brought down to 378, the year of the beginning of the barbarian victories over the empire. A similar chronicle, based on Bible history with additions from heathen authors and with strong antipagan tendencies, was composed by Sulpicius Severus, a younger contemporary of Jerome. Orosius, Augustine's faithful pupil, wrote at his prompting a *Historia adversus paganos* in seven books. He utilized the standard Roman historians and dealt first with the early history of the Babylonian, Roman, Macedonian and Carthaginian empires and then with the period from 378 to 417 A.D. His doctrinal bias was for the public of those days a positive merit and his influence throughout the Middle Ages was very great.

Universal history was attacked again at a later date by Isidore, bishop of Seville (d. 636). He was the last great encyclopaedist of the west during those days when considerable wreckage of earlier Latin learning still survived here and there and his writings consist almost entirely of scraps from older authors. Besides his universal *Chronicle*, he wrote a *History of the Goths, Vandals and Suevi*. But all his work is marred by his inaccuracies and by his fanciful habit of guessing at the origin and nature of things by a very unscientific etymological method. Embracing the apocalyptic ideas of an imminent Second Coming, which were widespread in all phases of mediaeval thought, he consecrated the idea that world history might be divided rhythmically into six periods, of which the last was by implication now nearing its end.

When the barbarian conquerors began to settle down and Christianity had proved itself the strongest centralizing factor in society and only such ancient literature survived as was preserved in Christian libraries, the controversially propagandist spirit of the early writers died out. It was no longer needed; the points for which Augustine had so hotly contended were now taken for granted. Theological bias did not decrease; indeed it became greater, but now it rather assumed the form of superstitious credulity in a society comparatively illiterate and saturated with crude beliefs which the church had rather veneered over than eradicated. At the same time contemporary or subcontemporary

history became sufficiently important to attract here and there men of real historical sense. The *History of the Goths* by Theodoric's great minister, Cassiodorus, must have been a work of very great value, full of trustworthy information about these people who were making a new Europe out of the old Roman world. But here, as in so many other cases, the original has been driven out by the compendium contained in the *Origin and Deeds of the Goths* written by Jordanes (c. 550). The work of Gregory, bishop of Tours (d. 594), coming slightly later may be taken as a type of the new historiography bred of the great events that had marked the two centuries since Augustine. He wrote a *History of the Franks* in ten books and seven books on miracles. His history begins with a brief compendium of world history from the traditional sources but it soon comes down to his own Gaul and its first Frankish king, Clovis. Gregory had himself played a great part on the political stage and his story was written at first hand, or at least from living traditions of court and church. Moreover the author had a real conscience. He had grisly stories to tell, which might offend powerful folk, but he comforted himself with a quotation from Sallust: "It seems a hard task to write history; first, because we have to reconcile facts with words; and secondly because whensoever you blame men's transgressions, many folk ascribe your words to malevolence and envy." Yet as a born poet he sees all life dramatically; and, however incorrect his Latin grammar may be, the literary side of his book is even more prominent than its scientific side. Therefore, like those of Eusebius, Jerome and Orosius, his book presently became a classic; Fredegarius (c. 630) and other Frankish chroniclers built their own later records on his foundations.

The Venerable Bede (673-735) was also a historian whose main value consisted in his personal knowledge and his grasp of living tradition. His *The Ecclesiastical History of the English Nation* with a few slighter works put him among the foremost historians of the Middle Ages. He was a model monk, a man of wide and solid learning, a good Latinist, a mathematician interested in chronology, a critic accustomed to weigh his authorities, in so far as mediaeval orthodoxy permitted criticism in the face of miraculous stories, and anxious to disclaim all personal credit for what he had borrowed from others.

The lives of saints and collections of miracles represent another numerous class of writings which are found among the earliest of Christian

records and which subsisted to the last—not altogether with undiminished fervor and popularity perhaps but still in sufficient volume to outweigh the more strictly historical writings of their time. Such writings, however unhistorical they often are in their direct form, nevertheless contain precious incidental information as to the social life of their time. But many of them unquestionably tended to debase the currency of historical truth. Thus Agnellus in his *Vitae pontificum ravennatum* (839) confesses that there were some individuals concerning whom he could find neither documentary nor traditional evidence; yet he writes their lives with the help of God and the prayers of the brethren.

Side by side with these compilations of world history, records of contemporary history and lives of saints there grew up gradually a series of annals. Monasteries kept handbooks or tables giving the date on which Easter fell in each particular year; at some time it naturally occurred to someone to fill in the rest of the line with the record of one single event of that year, as in many modern almanacs. Copies of these tables were often made for other monasteries or for cathedral libraries; as they migrated they became fuller and fuller, until the Easter Table had grown into a brief volume of annals. Then came another inevitable stage; some writers took these bald notes and wove them into a continuous and picturesque narrative, still keeping the order year by year. Thus the annals grew into a chronicle, which is the characteristic form of mediaeval historical writing.

The structure of the chronicle in its annalistic form was decentralized like the decentralized feudal society which had given it birth. Some of the chronicles, like those of Liutprand, Guibert of Nogent, Jocelin of Brakelond, Villehardouin, Joinville, Salimbene, Ramon Muntaner and the *Scalacronica*, are personal and autobiographical and diverge from the main chronicle type. Others, like the chronicles of Evesham or Meaux or Walsingham's *Lives of the Abbots* of St. Albans, tell little more than the story of a single monastery or, like the *Chronicle of Florence* of Dino Compagni and the *French Chronicle of London*, of a town. But many deal with whole countries or even with the whole of Europe and a little beyond. Moreover occasionally something like formal schools of historians are found. The great abbey of St. Denis had a succession of chronicles under more or less definite royal patronage continuing one from another in Latin from about 1250 to 1368 and in French down to

1380. At St. Albans again, although the theory of a succession of officially appointed historians has been abandoned, there is only one gap in the succession from at least the latter half of the twelfth century down to 1422. This, however, can be said of only a few out of the many monasteries.

As civilization advanced, the chronicle outgrew its original limitations. While keeping its chronological order, it often became a real history. This movement coincided with the general revival which began roughly about the year 1000 and by 1100 had become a veritable renaissance. The influence of the crusades, the general movement of expansion, the great increase in knowledge and the effect of the political and theological controversies were reflected in the later historical writings. A more critical spirit developed with a greater discriminating use of sources as well as a more realistic insight into political events and movements. On the whole, no land produced such great chronicle historians as England. Apart from Bede there were William of Malmesbury (d. c. 1143), learned, critical and an admirable Latinist for his time; his contemporaries Henry, archdeacon of Huntingdon (c. 1084–1155), and Ordericus Vitalis (1075–c. 1143); and a whole group of northern chroniclers. William of Newburgh showed strong critical sense, repudiating the mainly fabulous *History of the Britons* by Geoffrey of Monmouth (c. 1100–54) as “ridiculous figments” and crying shame on “the negligence of modern men” for having recorded so little of the great deeds of their time. On the continent, although many chronicles of great interest were produced especially by eye witnesses of the crusades, the only writer who can be set beside William of Malmesbury is Bishop Otto of Freising. But William, archbishop of Tyre (d. c. 1135), by compiling a general story of the crusades from his predecessors' records and bringing some real criticism and literary skill to the task took a definite step forward toward modern historiography. The change of spirit is especially noticeable in his dealings with the earlier chroniclers whom he uses. They explain everything from above; he already prefers to explain things from below. To them all is miraculous or providential; he tries to find and to stress natural human causes. Already therefore there are faint signs of the breakdown of what may be called “wonderism.” In the next century the St. Albans monk Matthew Paris (d. 1259) reached the high water mark of the true chronicle. In the fourteenth century a further

step forward was taken. Froissart (c. 1400) was far less bound to chronology than most of his predecessors. Indeed, fascinating as he is, neither chronology nor accuracy of fact is his forte; he is first and foremost a consummate literary artist. Even before him the citizen chronicler had come upon the scene. The best of these was Giovanni Villani (d. 1348), who brought into his story the acumen of a business man and the tidings which came to his native Florence by trade routes from all parts of Europe; it may even be surmised that for his narratives of foreign affairs he utilized the business news letters which came in his way. Indeed Italian chronicles multiply during this century in both number and value. The Latin classics had never been entirely neglected in Italy; they now appeared more definitely as models. The Renaissance had already begun, and history profited by it. Meanwhile decentralized feudalism was giving place to the centralized modern state, and historiography took on the color of the new society. Writers viewed their subject from a higher standpoint, saw it more as a whole, philosophized more deeply and brought more documentary vouchers. This voucher system had already begun to some extent in England, where the struggle between king and barons had done much for political education. The Burton annals, for instance, quote valuable public documents, and Matthew Paris is inestimable in this respect. But in this field Italy reached somewhat nearer to the modern ideal than any other country. The *Chronicle* of Farfa as early as 1100 is in many ways extraordinarily modern and accurate; it is a collection of original documents connected by a thread of narration. Caffaro (c. 1080-1166) presented his *Annals* to the consuls and Council of Genoa, and they were copied and placed among their archives. Thenceforward the work was officially patronized; it was continued by various officials of the city. In 1270 Jacopo d'Oria together with other collaborators began his work on the Genoa chronicle; in 1280 he was made official annalist and keeper of the archives and in 1294 he publicly presented his work to the podesta and councilors. His work represents systematic historiography and is not without the critical spirit, although the main note was naturally the glorification of Genoa.

The greatest strides in historical writing were taken by the statesmen historians of the later mediaeval generations. Matthew Paris showed real political sense and the widest political interest. He had traveled and held responsible offices

and at St. Albans he could talk with other travelers of all ranks and from all countries; the king could bid him sit and listen to discussion of matters of state; but his outlook after all was a good deal limited by his monastic status and the interests of his Benedictine order. There is naturally more freedom of thought, more criticism and more systematic political philosophy in men like Aeneas Sylvius (d. 1464) and Philippe de Commines (c. 1447-1511). The former had been among the busiest and not the most scrupulous of politicians at the Oecumenical Council of Basel. Commines had been minister first to Charles the Bold of Burgundy and then to his rival Louis XI of France. Each had spent his life in reducing politics to a science and each possessed that sense of form, that clarity of thought and conciseness of style which are far commoner in the Latin countries than elsewhere.

Mediaeval historiography, generally speaking, is a mirror of mediaeval society. It is impregnated with the religious and eschatological preoccupations of the age. For its foundation it had the wreckage of classical history; upon this it built until society had become sufficiently settled to evolve a literary type of its own. But down to the very end of the period there was a great lack of science in the modern sense. Historians almost without exception refrained from ever calling in doubt any of the dogmatic facts which were binding on faith. Material circumstances were unfavorable and the spirit was not strong enough to overcome them. Books were scarce: even at great monasteries successive catalogues often bear witness to the very limited number of books written or acquired between one age and another. The Middle Ages never revived or rediscovered the simple system which had obtained in pagan Rome of training a sufficient number of competent scribes to assemble the books in one room and multiply by dictation the book to be copied. Even of so great a work as the *Chronica majora* of Matthew Paris it is doubtful whether there were ever half a dozen complete copies in existence. The strictest of reformed Benedictines, the Cistercians, did little for history; indeed in their earliest fervor they rather reprobated it as frivolous. Again, the Benedictine monasteries retained a great deal of their original individualistic spirit; it is true that there was much interchange through passing guests and through the bearers of mortuary rolls, yet there was less literary communion than might have been expected. Most of the chronicles

therefore are rather parochial in their outlook. There existed a Greek school of chroniclers, who wrote with more political insight and more delicate psychology than any but the best of the Latins; yet these were almost altogether ignored or even unheard of in the west. Roger Bacon, anxious as he was to put other subjects on a higher footing by organizing translations from the Greek and by the application of scientific method, did not extend this zeal into the domain of history. Research did not receive general encouragement. Here and there a chronicler persuaded travelers to make inquiries for him, but on the whole the temptation was very great to take the first story and inquire no farther. Very few authors are free from impossible legends; for example, that Tiberius destroyed Jerusalem as an act of just retaliation for the crucifixion or the absurd fables about Mohammed or that concerning Pope Joan, which was not only repeated from chronicler to chronicler but even quoted at the Council of Constance. To these must be added deliberate forgeries, such as the pretended Donation of Constantine and the False Decretals, which remained practically unquestioned for centuries. There are not many of the great monasteries which have no forgeries among their early charters.

The mediaeval historian as compared with the ancient and the modern has the child's keen interest in men and things, the child's directness of observation and picturesqueness of expression and often just that little point of naïve malice which lends such charm to a child's report of what he has seen and heard. But his calculations of numbers, for instance, can scarcely ever be trusted, and nearly always exceptionally great allowance must be made for his professional or religious bias. He has his characteristic virtues and his characteristic defects. The most important truths contained in his work are often to be derived only indirectly: while he is chiefly concerned to tell one thing he unconsciously reveals another. The typical mediaeval history, at least up to the thirteenth century, may fairly be compared with red Indian natural history—curiously true and observant where daily hunting contact is concerned but beyond that lacking all sense of probability or evidence or sequence of cause and effect.

G. G. COULTON

Modern Europe. Modern European historical science begins with the period of the Enlightenment. The Renaissance had plowed the ground,

had brought forth from antiquity new models of historical writing and had given rise to the beginnings of historical criticism. Machiavelli in his *Istorie fiorentine* (1532) established the nation as the unit in historical writing and was followed by the German Sleidan, the Frenchman de Thou and the Englishman Clarendon. Guicciardini's *Istoria d'Italia* (1561) provided the model for the treatment of the nation state in its foreign relations, which was followed by Chemnitz for Sweden and Pufendorf for Brandenburg. The works of all these writers were built upon increasingly rich documentary material.

The religious conflicts arising out of the Protestant revolt sharpened the critical faculty and also intensified the desire for authentic documents. The Catholic *Annales ecclesiastici* (1588-1607) of Baronius, which were set up against the work of the Protestant Magdeburg Centuriators, was the first historical work which could make use of the numerous documents of the Vatican archives. The *Acta sanctorum*, published after 1643 by the Jesuits and used for the same defensive purpose, marks the beginning of the methodical collection of source materials. This example was followed in Germany in the *Scriptores rerum brunsvicensium* (1707-11) collected by Leibniz and the *Scriptores rerum austriacarum* (1721-25) by Pez; of even greater importance were the *Scriptores rerum italicarum* (1723-51) collected by the Italian Muratori and the *Recueil des historiens des Gaules et de la France* (1738-1833) begun by Dom Bouquet. Religious struggles in Italy were reflected in the works of Paolo Sarpi (1552-1623) and Pietro Giannone (1676-1748), who laid the foundations for the study of ecclesiastical institutions and of constitutional history.

The age of discovery and the commercial revolution brought about a widening of the scope of historical interest to include non-European lands and peoples and were reflected particularly in the works of the Spanish and Portuguese historians of the fifteenth to the seventeenth century. The historiography of the Iberian Peninsula during this period was marked by a broad interest in affairs and institutions beyond the events connected with royalty and the military as well as by a greater interest in contemporary events. The philosopher of history Vives considered many of the modern historians to be the equals of the classic writers and he urged the scholar to go into the trade marts and workshops for detailed knowledge of events. Lopez de Gomara held the discovery of America to be the

most important event after creation and the coming of Jesus. Paez de Castro pointed out the necessity of the comparative study of the customs and institutions of the New World and their relations with those of Europe. The collection of geographic and ethnographic materials moreover was actively fostered by the Spanish and Portuguese governments and explorers were provided with questionnaires for this purpose. Both the humanistic writing of history and the confessional kind, however, turned for the most part from the world of inductive thought. Up to the end of the eighteenth century the prevailing interpretation of history continued to be one that was based upon ancient authorities and founded on the Christian philosophy of history. It is with the period of the Enlightenment that a wholly new historical viewpoint developed out of the intellectual foundations laid in the seventeenth century.

The French historians of the Enlightenment, particularly Montesquieu and Voltaire, discarded the Christian interpretation of history as well as all its valuations and blazed the path for a scientific and critical interpretation of history. They made the decisive step of placing the science entirely upon its own feet, eliminating traditional authorities as well as the connection with theology. Reasoning criticism was no longer considered as merely a destroying power but rather as the means of attaining higher knowledge. They endeavored to write universal human history by including Asia and America in the range of their survey, and in bursting the bonds of state and church history and aiming to bring within their orbit all phases of social life they laid the foundations for a general history of human culture. The content of the first world history of the Enlightenment, the *Universal History from the Earliest Account of Time to the Present* (London 1736-65), was not, it is true, the application of the philosophy of enlightenment to history but rather the digestion of an unprecedented amount of material on all peoples and all ages. It was by no means a masterpiece but it bore the new viewpoint through numerous translations into the cultured circles of the entire West. The historical writings of Voltaire, Montesquieu, Hume, Robertson and Gibbon, distinguished by an increasing preoccupation with the literary form of their presentation, achieved a popularity hitherto never attained by historical works and spread the gospel of enlightenment throughout Europe.

In place of the Christian interpretation of

history the historians of the Enlightenment set up a new dogma based on the idea of the progress of humanity and with the victory of reason as its highest goal. It was, however, an idea of progress without development and thus led to one-sidedness, to an overestimation of their own age and to a lack of understanding and sympathy with the historical epochs in which the rule of reason was lacking. The individual as well as the manifold character of historical development was neglected and the altogether too rationalistic concept of causality as represented in their catastrophic theory of history simplified their interpretation in an illegitimate manner. A really profound immersion in the past was contrary to the whole tenor of the movement. What the Enlightenment contributed to the science of history in the way of fundamental principles was never lost, not even in Niebuhr or Ranke. But it had to be supplemented before it could make another advance.

Opposing voices against the ideas of the Enlightenment were raised in Italy, in Germany and after the beginning of the French Revolution in the person of Edmund Burke in England. The Italian Vico, in his *Scienza nuova* (1725), proclaimed the principle of the intrinsic worth of each age and the role of each epoch in preparing the way for the succeeding one. When Winckelmann in 1764 brought Greek art to the notice of the world and raised it to the level of an imperishable ideal, the concept of progress was shattered: a far distant past was greater than any present. Similar results were produced by the researches of those who, like Justus Möser, investigated the history of their local homelands and also saw in the past values which could not be reconciled with the growth of reason. The publication of local historical sources had called attention to the individual forces of the past and emphasized emotional values which the Enlightenment had not known. The German generation of 1760 to 1790 was torn by the conflict of the acceptance or the rejection of the Enlightenment. Herder is the typical representative of this generation. In his early work *Auch eine Philosophie der Geschichte zur Bildung der Menschheit* (1774) he applied the principle of development to cultural history and was one of the first to recognize the significance of the Middle Ages. His *Ideen zur Philosophie der Geschichte der Menschheit* (1784-91), which bears the spirit of the Enlightenment in its very title, in the universal historical breadth of the subject and in the cultural interpretation of history, is at the

same time far from a rationalistic consideration of history. Herder exhibits the influence of Winckelmann and the antirationalist spirit of the *Sturm und Drang*, which emerged later in romanticism. The reaction was even stronger in Burke, whose *Reflections on the Revolution in France* (1790) although not really a historical work exerted a profound influence in England and on the continent as a declaration of war against the Enlightenment. The unhistorical elements in the theories of the Enlightenment were revealed with political vehemence without, however, clearly indicating a more penetrating point of view.

A further impetus to the development of the historical sense was supplied by the romantic movement. Litterateurs like Chateaubriand and Sir Walter Scott aroused an enormous interest in the study of the past. Romanticism emphasized the law of continuous development, recognized the significance of tradition, gave cognizance to the irrational and the individual in history, replaced the ideal of humanity by that of nationality and thus laid the basis for the subsequent doctrine of the folk soul. Although romanticism contributed nothing of importance to the development of more scientific methods of investigation and research and although many of its historical conceptions are so false that they must perforce be pushed aside by any earnest investigator, it did, however, direct the attention of the historian to new problems and suggest new methods of approach. Perhaps more significant in this respect was the influence of Hegel. Hegel's desire to unify world history was a truly scientific achievement. He endeavored to explain history not by its own laws but with the weapons of philosophy and by means of such concepts as the struggle between freedom and unfreedom and the realization of the absolute spirit in history. His influence on historians was especially exhibited in the case of F. C. Baur and the Tübingen school and historians like Chicherin in Russia.

New elements for the development of scientific history came partly from historical research itself and partly from the ranks of classical philology. The source editions published during the eighteenth century both by the academies and by individuals contained materials which emphasized the individual fact and the local neighborhood; but an even greater impetus toward the application of a new method to the historical sources came from the philological criticism of the sources. Friedrich August Wolf's

Prolegomena ad Homerum (1795) set up a new program for the application of critical methods to historical texts. His example was followed by Barthold Georg Niebuhr, who achieved immediate fame throughout Europe on the publication of the first volume of his *Römische Geschichte* (1811). It is true that the earliest Roman history had been criticized some seventy years previously by French savants, but Niebuhr's special trail blazing achievement in historical research lay in the consistent performance of source criticism, in the separation of all that was handed down into its constituent parts and in the excavation of the remaining usable material. Niebuhr transformed Wolf's philological method into a historical one and established a law for all criticism of historical sources; he thus gave historical research a firm scientific foundation. Thenceforth dilettantism and science were clearly differentiated. Niebuhr's influence upon the following generation was as great as his achievement merited: the modern science of history dates from him. About the same time the science of the history of law was founded under similar influence by Eichhorn and Savigny.

Even more significant for the development of history as an independent science was the work of Leopold von Ranke. Ranke opposed the historical views of both the romanticists and the Hegelians. He represents the fusion of the historical ideas of the eighteenth and nineteenth centuries. Whatever endured from the Enlightenment and whatever came from Herder, from Friedrich August Wolf and classical philology, from Niebuhr and finally from romanticism Ranke absorbed, fashioned and developed in so far as these ideas accorded with his standpoint. For him the definite ascertaining of the historical facts was the first and highest duty; what he wrote in his monograph *Zur Kritik neuerer Geschichtschreiber* (1824) became the basis of all source criticism. In desiring to show "how it actually happened" he pointed the way to inductive research. No doubt Wolf and Niebuhr were his teachers in this, but he applied their theorems—extending them into a method—to the entire field of history. His trend toward universal conceptions linked him with the Enlightenment; but as he placed the research of the detail before all universal history, he turned enthusiasm into science. He was inspired by romanticism, since he also considered the national state and the folkways to be the enduring elements in history; but he carefully refused to allow contemporary tendencies and romantic

sentiments to affect his conception of history. Although he rejected abstract philosophy of history, his works express conceptions of universal history which also represent a bit of philosophy of history, without, however, being characterized by rigid system or dogmatic compulsion. He surveyed times and peoples, comprehending their differences and their unity, and he expressed in artistic form what he had brought to light by research and intuition. The opening of the archives, which France had begun after the revolution, first allowed him to exploit the new, immeasurable field of work with the spirit of a discoverer and with this new material to lay firm bases for research into the history of modern times.

Ranke's influence can scarcely be overestimated. It was not confined to Germany but was recognized throughout Europe. In Germany Sybel, Waitz, Giesebrecht and their numerous disciples continued the work of the master along their several specialized lines, although the growing political coloration of their writings led them away from Ranke. Most of these historians were influenced by the movement for German unity. The so-called Prussian school of historians, which advocated Prussian leadership in Germany, was nationalistic in the Prussian sense as well as liberal. Ranke with his liberal conservative attitude wanted to stand above the parties, and thus he remained the conscience of German historical science even during periods when it entered with nationalist political vehemence into the struggle over Germany's transformation. This struggle involved even those who did not belong to Ranke's school, such as Droysen, who made ancient history an independent historical science and at the same time was the most powerful advocate of the Prussian point of view; Häusser; and last of all Treitschke, whose *Deutsche Geschichte im 19. Jahrhundert* (1879-94) was the most one-sided and yet the richest and most beautiful historical monument of Germany's national movement.

The growth of nationalism in the nineteenth century while detrimental to the achievement of a more critical and scientific approach to historical problems did, however, provide a great impetus for the writing of history. It was in large measure responsible for the organization and publication of the great collections of source materials. Inspired by the ideal of uncovering the folk origins of the various nationalities, these national historians developed simultaneously a most expert and critical method for the handling

of source materials. The *Monumenta Germaniae historica*, the collection of sources of German history of the Middle Ages, which was begun in 1826, evolved under the leadership of Pertz into the development of an editorial method which thenceforth became a standard for all expert publications. The search for all obtainable manuscripts, the ascertaining of the oldest and best, the determination of the extent to which any source depended upon its eventual predecessors and the producing of a philologically perfect text for printing, making use of all important variants of tradition—all this furnished a methodological foundation for the publication of sources. What Pertz did for source editing Böhmer carried further for documents: his *Regestas*, which reproduced the contents of the documents in the most concise form although with adequate literal extracts, made it possible to open up this almost illimitable field of research. In France Mabillon's palaeographic work received further impetus in the founding of the *École des Chartes* in Paris in 1829. Guizot in 1833 organized the *Société de l'Histoire de France* and began the publication of the *Collection de documents inédits sur l'histoire de France*. England had its *Rolls Series* and Spain its *Collección de documentos inéditos por la historia de España*. Similar steps were taken by most of the smaller nationalities in the latter half of the nineteenth century, resulting in such works as the great Croatian-Dalmatian source collections started by Kukuljević-Sakcinski and Racki. Together with the collection of documents came also the development of national history. Luden, Raumer and the Prussian school in Germany; Guizot, Michaud, Lamartine and Henri Martin in France; Green, Froude and Macaulay in England; Lafuente in Spain; Cuoco and Botta in Italy; P. A. Munch in Norway; P. J. Blok in Holland, all were influenced by the nationalist current and in turn contributed considerably to its further stimulation. This close relationship between history and nationalism is evidenced even more strongly in the Slavic countries and in Hungary. Palacky in his *Geschichte von Böhmen* (1844-67) although under German influence founded a purely national Czech school of historiography, which became the backbone of the nationalist movement. Lelewel performed a similar service for Polish historical research. In Russia Karamzin wrote the first important national history; under the influence of the Slavophiles attempts were made to trace in Russian history the continuity of the so-called inherently

Russian folk traits and institutions. Jewish historiography likewise was stimulated by the growing national movement and bore fruit in the great national histories of Jost, Graetz and Dubnow.

The growth of liberalism and the democratic traditions of the French Revolution have also left a deep impress on historical writing. These tendencies are exhibited in Germany in the writings of Rotteck and Gervinus and in Dahlmann's works on the English and French revolutions. In Russia writers like V. I. Sergeyevitch and V. N. Latkin attempted to discover in early Russian history the embryos of liberal institutions analogous to the representative institutions of western Europe. In France, where the attitude toward the revolution and toward Napoleon was of great importance for a long time, the struggle over these principles so colored historical writing that the really scientific element was slow to make itself felt. Romanticists like Thierry and Barante contributed little to historical research and even in the case of Michelet it may be doubted whether the art of the representation compensates for the great defects in the research. Thierry, Guizot, Thiers and their disciples were imbued with the doctrines of political liberalism and looked to history to supply them with support of their theories. De Tocqueville attempted to correct these liberal theories and Quicherat insisted on precise source criticism. As director of the *École des Chartes* he contributed much to the auxiliary disciplines. Only with Fustel de Coulanges does French historical science begin to be concerned with factual research, to reject all abstractions and to seek for objective knowledge. Under his influence there ensued a great mass of detailed studies on mediaeval history, on French institutions and on social life. Traces of nationalist bias still remained, however, as in the controversies concerning the relative importance of the Roman and Germanic elements in mediaeval society; and the attitude toward the revolution has continued to be closely bound up with the current political struggles.

In England the romanticist conception of history was followed by a liberal period characterized predominantly by Macaulay. Macaulay was not a great historian although very erudite; but he attained great popularity through his liberal *Weltanschauung*, which was in accord with the time, through his popular art of description and through the depicting of a period which was very dear to the Englishmen of his day. Although he wrote from the same liberal

point of view, Grote with his *History of Greece* (1846-56) stood much higher than Macaulay. Influenced by Niebuhr, especially in rigid source criticism, Grote maintained his position for a long time despite his prejudice in favor of Athenian democracy. To some extent he broke through the spell of the ideal which Winckelmann had cast over the Greeks. It is doubtful whether Thomas Carlyle can be called a historian, for he was a worshiper of greatness rather than a real analyst of this greatness. He was a master of dramatic description and viewed the historical process as consisting solely of great personalities; he simplified the complex into good and evil, positive and negative, as he happened to see the matter.

Italian historical research followed a similar course during the nineteenth century. The liberal tendencies overcame romanticism, and under the influence of nationalist ideas there arose a historiography which was of importance for the world of ideas of the new Italy but which was markedly lacking in methodological research. With Pasquale Villari, Malfatti, de Leva, Comparetti and Pais there began in the second half of the century a work of criticism which was very much under German influence and which resulted in a renaissance of historical research leading to the publication of numerous editions of mediaeval sources, to important work in the history of classical antiquity and to exhaustive studies on the Italian Risorgimento.

In Spain and Portugal the "Inquisition" theory of Iberian decadence, which found support in the work of Llorente and Herculano, enjoyed considerable prominence in the struggles between liberals and reactionaries. There is also present the continued attempt to establish the existence of a cultural tradition in the peninsula and to provide a solid historical basis for the pan-Hispanic movement and thus vindicate the colonizing work of Spain and Portugal. The work of Menendez y Pelayo and his followers in the first respect has been very fruitful. The attempt was also made to incorporate the Hispano-Arabic culture into this tradition. The disaster of 1898 contributed greatly to a discussion of the Spanish national character as shown in its various accomplishments or lack of accomplishments. Perhaps the culmination of the threads in modern Spanish historiography is to be found in the work of R. Altamira, whose *Historia de España y de la civilización española* (1900-11) was the first work of synthesis based on the new methods. Altamira, who is also a

leader of the pan-Hispanic movement, seeks to discuss every aspect of civilization and gives considerable attention to the cultural achievements of the Spanish people. He holds that the work of various individuals in this field should merit attention even though they had no especial influence, for they indicate the potentialities of the national character.

Great changes in historical outlook were brought about by the interaction of history with the other social sciences. Auguste Comte, influenced by Condorcet and Saint-Simon, thought it was possible to apply the methods of natural science to history, to discover its laws and to predict the future. In spite of all his errors due to insufficient knowledge of the historical facts and to his opposition to everything metaphysical his ideas proved to be a fertile stimulus and no doubt contain an element of truth which will endure throughout the future. For Comte turned historical research away from the predominant emphasis upon great personalities and the state toward a consideration of community phenomena, out of which the state arose originally and which form the basis of historical events. Since his time the sociological point of view has entered into all profound historiography. To Comte is also due the idea that the evolution of intellectual life is the basis of history and that every people has a mass psyche, out of which grow all its actions and customs. To these ideas Taine added the concept of the milieu or environment as the explanation of historical events, a concept which was utilized by so many historians of the latter part of the nineteenth century.

French positivism was transplanted to England in Buckle's *History of Civilization in England* (1857-61), which made a much stronger impression than Comte himself had ever been able to create. Buckle used the methods of natural science which aimed at the statistical investigation of mass movements; he was not interested in individual facts or in personalities. He was also firmly convinced that cultural development is based solely upon science and he accepted without discrimination whatever fitted in with his liberal theories. As he spoke in the scientific spirit of the time, his work met with considerable approval. But the acceptance of the German historical method in England during the 1860's again limited Buckle's success.

The industrial revolution had also brought about an increasingly greater concern with social and economic history. The writings of Lorenz von Stein and Karl Marx directed attention to

the interaction between state and society, to the greater significance of economic factors and to the element of class struggle in history. The Marxist point of view while not completely adopted by historians did, however, open up new fields of investigation and was particularly significant in the development of economic history (*q.v.*). In Communist Russia it has become the ruling point of view and is the guiding principle in the historical writings of M. Pokrovsky and his pupils. The historical traditions of Kluchevsky dominant in pre-war Russia have been almost completely submerged.

Archaeology and anthropology have been of particular significance in pushing back the limits of history and bringing prehistory within its field. The study of the ancient Near East and classical antiquity has been especially benefited by the stimulus of these sciences. The deciphering of hieroglyphics by the Frenchman Jean-François Champollion, which was practically completed by 1822, and the slow deciphering of cuneiform writing by the German Grotefend in 1802 set wholly new tasks before the historical explorers of the Near East. In his *Geschichte des Altertums* (1852-57) Max Duncker condensed the first results of this research. A new culmination in historical research of antiquity was reached in the *Römische Geschichte* (1854-55) of Theodor Mommsen. Mommsen built up his work upon all the remains of the past—upon manuscripts and inscriptions, laws and customs, coins and works of art, works of literature and religious traditions—and there is no doubt that he outdid considerably his great predecessor Niebuhr both in acuity of criticism and in the faculty for positive synthesis. Most of all he surpassed Niebuhr in the art of his writing, which was extremely vigorous and alive, often too colored by contemporary events but causing the reader to relive the past. The reconstruction of the civilizations of the ancient Orient was continued in the works of Lepsius, Mariette, Maspero and Rawlinson. The flood of new material and the complexity of the problems raised resulted in an increased narrow specialization within this field of inquiry. It was only in the monumental work of Eduard Meyer that a mind was found sufficiently erudite and encyclopaedic to be able to survey the whole complex of ancient civilization. The revival of intellectual history in the nineteenth century is greatly indebted to the work of Jakob Burckhardt. His *Kultur der Renaissance in Italien* (1860) represents the first scientific statement of a history of culture in

terms of intellectual history. The battle of *Kulturgeschichte* as against political history was continued in Germany by W. H. Riehl, Eberhard Gothein and Lamprecht; while Gomperz produced a masterful work on Greek thought, and Dilthey through his philosophical works as well as through his penetrating studies in the intellectual history of the seventeenth and eighteenth centuries inspired the cultivation of the so-called *Geistesgeschichte* in Germany. In England a somewhat different form of intellectual history was represented by Lecky's studies on European morals and rationalism and Leslie Stephen's work on English eighteenth century thought.

Institutional and constitutional history also broadened into new lines of investigation under the influence of the study of primitive society and the use of the comparative method. Gierke in Germany, Maitland and Vinogradoff in England and Kovalevsky in Russia are the outstanding representatives of these tendencies.

Thus European historical science was much more firmly established at the turn of the nineteenth century than it had been one hundred years before. Out of the research of individuals there had grown a firmly founded science with a well developed methodology and embracing all the fields of history. The ideological systems of the eighteenth and the beginning of the nineteenth century had been forced into the background—historical research determined its own goals. Germany, England and Scandinavia devoted themselves almost exclusively to the ascertainment of facts; whereas the philosophy of history was given greater weight in France, Italy, Rumania and Russia. Everywhere new specialized fields developed: state and constitutional history, history of culture, history of religion, history of the church, economic history, the auxiliary historical sciences, not to mention the related fields such as ethnology, prehistoric research, sociology, intellectual history, historical geography and geopolitics. Although historical research seemed to result in specialized history it always received new impulses for the extension of its aims and for the universal statement of its results both from within itself and from its related sciences. This endeavor of European historical science was represented primarily by Karl Lamprecht. His goal was a general historiography embracing everything: the discovery of historical laws, especially by means of comparative research, and the establishment of the psychic as the foundation of historical development. In Lamprecht the positivist and

natural scientific concepts were united with the universal historical ideas of Herder and of the Enlightenment, and there was no field of historical life which he did not endeavor to include within the scope of his research. The execution did not quite satisfy the magnitude of these goals, but he became a source of stimulating suggestions for all historical research.

A full explanation for the general rise of European historical research during the nineteenth century would be incomplete without mention of the large organizations which undertook the publication of the most important source editions or of the voluntary groups of savants who joined in the publication of big collective works. Government funds made possible the establishment of historical institutes, such as the *École des Chartes* in Paris, the *Institut für Österreichische Geschichtsforschung* and during the last quarter of the century the *Istituto Storico Italiano* in Rome. Organic collective labor has become indispensable for historical as well as for natural science. The historical journal thereby became a necessary accessory. The oldest historical journals are the *Archiv für ältere deutsche Geschichtskunde* founded in 1820, the Danish *Historisk tidsskrift* in 1840, *Archivio storico italiano* in 1842, *Archiv für österreichische Geschichte* in 1848. The fullest development, however, followed only in the second half of the century. The *Historische Zeitschrift* began in 1859, the *Revue des questions historiques* in 1866, the *Revue critique d'histoire et de littérature* in 1866, the *Revue historique* in 1866, the *Mitteilungen* of the Institut für Österreichische Geschichtsforschung in 1880, the *Historisches Jahrbuch* of the Görresgesellschaft in 1880, the *Rivista storica italiana* in 1884, the *English Historical Review* in 1886 and the Swedish *Historisk tidsskrift* in 1889. By the end of the century all the larger European countries had their own historical journals in addition to a multitude of provincial and local organs. This made possible an exchange such as previous years had never known, and there developed a group of scientific collaborators who were able to subject all questions to highly diversified treatment. The writing of co-operative history is illustrated in the huge synthesis of universal culture attempted by Henri Berr in the *L'évolution de l'humanité* series, in the several Cambridge histories, in the *Propyläen Weltgeschichte* edited by Walter Goetz and the *Peuples et civilisations* series edited by Louis Halphen and P. Sagnac. International cooperation of students of history is carried on through

the International Committee of Historical Sciences.

The World War led to a grave interruption of the great work of collaboration. During the war historiography had been placed in the service of the causes of the various nations, and for some time after the war it was set tasks which were the outgrowth of the conflict. An enormous amount of documentary material was published, and the history of the last few decades before the war as well as of the World War itself placed before historians a task which absorbed all their available resources. Historical science profited by being able to test its strength on new and difficult problems and to show that it had become an indispensable power in the life of nations. But alongside such work, devoted primarily to the present, there is again arising a powerful tendency toward universal history.

WALTER GOETZ

Islam. The writing of history was one of the earliest disciplines cultivated by the Arabs after the rise of Islam. The natural interest of Moslem Arabs in legends and anecdotes relating to pre-Islamic days (*ayyām*) with their intertribal wars and epoch making events, such as the breaking of the Ma'rib dam, the digging of the Zamzam Well and the expedition of the "owners of the elephant" (Koran 105); the desire of early caliphs to scan the records of preceding kings and rulers; the interest of the believers in collecting traditions (*ḥadīth*) relating to Mohammed and his first followers; the necessity of ascertaining the genealogical relationship of each Moslem Arab, his kinship to the Prophet and his precedence in accepting Islam, all of which determined the amount of stipend he received from the state treasury; the elucidation of passages in Arabic poetry—one of the earliest and most fully developed forms of Arabic expression—and the identification of persons and places cited in religious works; the anxiety of conquered peoples to put on record the past achievements of their races as a counterbalance to Arab chauvinism, all these pointed the way toward historical research and composition. The main sources for Moslem history were therefore pre-Islamic stories transmitted by word of mouth, oral traditions relating to the life and campaigns of the Prophet and of his companions (*ṣaḥābah*), genealogical lists which also served as army rolls, poetical compositions including ballads, and the Koran and other theological works.

Al-Nadīm mentions a Yamanite story teller,

‘Abīd ibn-Sharyah, who composed for Caliph Mu‘āwiyah (661–80) a number of works dealing with the ancient history of south Arabia, one of which evidently survived until the time of al-Mas‘ūdī (d. 956). But the earliest works that have been preserved were composed during the Abbassid regime (after 750) and comprised biographies (*ṣīrah*), books of conquest (*maghāzī*), genealogies (*ansāb*) and classified sketches (*ṭabaqāt*) of traditionists, poets and the like. The oldest biography is that of the Prophet by ibn-Ishāq (d. 767), which has been preserved only in the recension of ibn-Hishām (d. 834). Al-Wāqidi of Medina (747–823) has left the earliest work of importance on the Moslem wars of conquest, and his secretary ibn-Sa‘d (d. 845) the first great book of classified biographies. The leading historian of the Islamic wars, after al-Wāqidi, was the Persian al-Balādhuri (d. c. 892), who was one of the first to integrate the many stories of the conquests of various cities and lands into one comprehensive whole under the title *Futūḥ al-Buldān* (ed. by M. J. de Goeje as *Liber expugnationis regionum*, Leyden 1866; tr. by P. K. Hitti and F. C. Murgotten as *The Origins of the Islamic State*, 2 vols., New York 1916–24), thus ending the era in which the monograph was the typical form of historical composition.

In these early historical works and in others which followed the form of presentation was that of the stereotyped religious tradition (*ḥadīth*). Each event is related in words of eye witnesses or contemporaries and transmitted to the final narrator, the author, through a chain of intermediary reporters. Thus al-Balādhuri introduces his story of the capitulation of Najrān to the Prophet: "Bakr ibn-al-Ḥaitham related to me, that ‘Abdullah ibn-Ṣāliḥ related to him, on the authority of al-Layth ibn-Sa‘d, on the authority of Yūnus ibn-Yazīd, al-Ayli, on the authority of al-Zuhri, who said . . ." The same tradition may be repeated on the same page with slight or no variation except in the list of the transmitters.

This tracing of the event to its ultimate source served to develop exactitude, as did also the insistence on dating occurrences even to the month and day. But the authenticity of the reported fact generally depended upon the continuity of this chain (*isnād*) and the confidence in the integrity of each reporter rather than upon a critical examination of the fact itself. Aside from the use of personal judgment in the choice of the series of authorities and the arrangement

of the data the historian exercised very little power of analysis, criticism, comparison or inference. In the introduction to his monumental work *Ta'rikh* (ed. by M. J. de Goeje as *Annales quos scripsit*, 15 vols., Leyden 1879-1901) al-Tabari gives expression to this principle when he declares, "We only transmit to others as has been transmitted to us."

By the time of al-Tabari (838-923) the situation was ripe for formal historical composition. The idea of chronological collocation of events now developed into a plan of complete series of annals. Whereas in medicine and philosophy Greek influence was paramount, in historical writing the Persian example was followed. The model was provided by such works as the Pahlavi *Khudāi-nāma* (The book of kings), which ibn-al-Muqaffa' (d. 757) translated into Arabic under the title *Siyar Mulūk al-'Ajam*. Al-Tabari's annals (*Ta'rikh*), in which the arrangement was chronological with the events tabulated under the year of the Moslem era in which they occurred, constituted the first universal history. This annalistic method was followed among others by Miskawayh (d. 1030), after whom Arabic historical composition started on its decline with ibn-al-Athīr (d. 1234) and abu-al-Fida (1273-1331). Thus the Moslem historian, who in the first two centuries was a traditionist, became now a chronicler. In his encyclopaedic *Murūj* (ed. and tr. into French by A. C. Barbier de Meynard and A. J. B. Pavet de Courteille as *Les prairies d'or*, 9 vols., Paris 1861-77, vol. iv, p. 89) al-Mas'ūdi (d. c. 956), who after al-Tabari was the greatest historian Islam produced, inaugurated a new system. Instead of grouping events around years he grouped them around kings, dynasties and topics. His treatment although followed by ibn-Khaldūn and minor historians did not enjoy such favor as al-Tabari's annalistic method. To all Arabic chroniclers political history was history par excellence: the economic and social aspects of life were touched upon only incidentally. Historical causation was mainly providential because of Allah's constant interference.

Neither the late Abbassides nor the crusading periods produced great historians. After ibn-al-Athīr the following authors, Sibṭ ibn-al-Jawzi (1186-1257), Bahā' al-Dīn of Aleppo (1145-1234) (Saladin's biographer), Usāma ibn-Munqidh (1095-1188) and abu-Shāma (1203-68), provide valuable material regarding military and cultural contacts between Franks and Moslems. Most of this material has been translated into

modern European languages, although earlier Arabic works remained practically unknown to mediaeval Europe. Ibn-Khallikān (1211-82) was the first Moslem writer to compose what we might term a dictionary of national biography. Before him Yāqūt (c. 1175-1229), a freed slave of Greek origin, composed a most comprehensive dictionary of learned men and ibn-'Asākir (1105-76) wrote in eighty volumes the biographies of distinguished men connected with Damascus.

Most of the historians of the Mameluke period (1250-1517), represented by ibn-Taghri-Birdi (1411-69), followed the traditional methods of historiography. But al-Maqrizi (1364-1442) deviated from the trodden path by emphasizing in his *al-Mawā'iz w-al-I'tibār fi Dhikr al-Khitāt w-al-Āthār* (ed. by Gaston Wiet, Cairo Institut Français d'Archéologie Orientale, *Mémoires*, vols. i-v, Cairo 1911-27; tr. into French by Urbain Bouriant and Paul Casanova as *Description topographique et historique de l'Égypte*, pts. i-iv, Paris 1895-1920) the topography and antiquities of Cairo; and ibn-Khaldūn (1332-1406) in his *Muqaddamah* (ed. by E. M. Quatremère and tr. into French by W. M. de Slane as *Prolégomènes d'Ebn-Khaldoun*, 6 vols., Paris 1858-68) was the first to formulate a comprehensive philosophy of Moslem history. In fact ibn-Khaldūn was the first to lay down what may be considered scientific principles for the writing of history, viewing it as a record of man's social development dependent upon physical and natural causes and upon the impact of environment on the individual and the group. This philosopher of history, however, failed to apply in his own work *Kitāb al-'Ibar* (7 vols., Bulak 1867; partly tr. by H. C. Kay as "The History of Yaman" in 'Umārah ibn-'Alī al-Hakami, *Yaman: Its Early Mediaeval History*, London 1892, p. 138-90; larger part tr. into French by W. M. de Slane as *Histoire des berbères . . .*, 4 vols., Algiers 1852-56) the scientific principles which he himself had enunciated. Nor was his influence on subsequent historians as great as one would expect. Until the present day Arabic historiography has not freed itself from conventional trammels and is still treated as a branch of Arabic literature or Islamic science. Such modern scholars, however, as the Christian Syrian-Egyptian Jurji Zaidān (d. 1914) and Moslems trained in European universities are beginning to apply critical methods to the vast accumulation of Arabic material. This western technique has scarcely affected Moslem works in

Persian but has been adopted successfully by such Turkish historians as Ahmed Djewdet Pasha (c. 1822-95) and Muṣṭafa Nūri (d. 1890).

PHILIP K. HITT

China and Japan. The Chinese early showed an interest in accurate chronology, and the orderly arrangement and preservation of historical writing have for centuries constituted one of the four grand divisions of Chinese literature. Until recently the most venerated of the classics was *Shu ching* (Canon of history, tr. by James Legge, *The Chinese Classics*, 5 vols., Hongkong 1861-72, vol. iii, pts. i-ii), parts of which were believed to date back to the twenty-third century B.C. But it is now clear that part of the lore dealing with the so-called "model emperors" of antiquity was crystallized as history at a much later time. The inscribed "oracle bones" discovered in Honan in 1899, however, go back at least to the twelfth century B.C., and certain historical poems in *Shih ching* (Canon of poetry, tr. by James Legge, *The Chinese Classics*, vol. iv, pts. i-ii) were brought together only a few centuries later. In the time of Confucius (551-479 B.C.) and Mencius (372-289 B.C.) it was already a well established custom for both the ancestral Chou house and the feudal kingdoms to support chroniclers whose posts were commonly hereditary. But the only chronicle of this period which has survived is the so-called *Ch'un ch'iu* (Spring and autumn annals, tr. by James Legge, *The Chinese Classics*, vol. v, pts. i-ii) and its three commentaries dealing with the period 722-481 B.C. This happens to be the chronicle of the kingdom of Lu in which Confucius lived, but it is certain from references in Mo-ti, Mencius and other sources that each of the Chou feudal kingdoms had its own annal, of which unfortunately none but that of the Lu kingdom survived after 206 B.C. This work is strictly chronological with such data as victories, defeats, murders, famines and strange cosmic phenomena recorded in the briefest possible language under the year, season, month and day of the reigning prince. The name of Confucius was early associated with it, not merely as its compiler but as one who used it as an instrument for political and social reform. Later philosophers and historians professed to find therein evidence of Confucius' interest in the "rectification of terminology"; that is, his deliberate use of language designed to indicate his "praise or blame" of the events recorded. For this reason Mencius says that on the completion of the spring and autumn annals "rebel-

lious ministers and villainous sons were struck with terror." Following this example it became a recognized function of later historians not merely to record facts but to pass ethical judgments upon them. History came to be regarded as a mirror, not in the sense of giving a faithful reflection of the past (which it often did) but one wherein rulers and others in authority might discern which types of conduct to emulate and which to avoid. In consequence of this ethical interpretation of the past the concept of change and movement was almost eliminated from Chinese history, which came to be regarded as a record of seemingly static ideas. This tendency is observable in the great *Tzu chih t'ung chien* (Mirror for help in government) completed by Ssu-ma Kuang in 1084 as well as in Chu Hsi's *T'ung chien kang mu* (Mirror of history), a reconstruction and condensation of the former. De Mailla's French translation of the substance of the latter (13 vols., Paris 1777-85) passed on to the West the above concept which did so much to vitiate the true picture of China's past.

In the *Kuo yü* (Narrative of the states), written by an unknown author possibly in the early fourth century B.C., the chronological form is for the first time abandoned in favor of a connected narrative covering not merely one state or one rank of society but several kingdoms, and these from a much broader social point of view. This step was carried to its logical conclusion by Ssu-ma Ch'ien (c. 145-c. 87 B.C.), the outstanding individual historian of Chinese antiquity, whose *Shih chi* (Historical records, partially tr. into French by É. Chavannes, 5 vols., Paris 1895-1905) became the first general history of a consolidated China and the model of all the ensuing dynastic histories, constituting in themselves a great historical library of more than four thousand chapters. The data in these official histories is with minor variations brought together under the following five categories: imperial biographies, tables on chronology and ranks of nobility, records of noble families, monographs on the arts and sciences and biographies of eminent men and women irrespective of social position. This arrangement made it comparatively easy for the reader to get at the facts but involved needless repetition and destroyed the continuity of history by assembling materials topically similar but chronologically unrelated or disjointed events that should be treated as wholes. These and other merits and demerits of Ssu-ma Ch'ien's arrangement were fully criticized by Liu Chih-chi (661-721) in his great

work on historiography, *Shih t'ung* (The comprehensive study of history), published in 710, as well as by Cheng Ch'iao (1104-1162) in the preface to his *T'ung chih* (General history) published in 1161.

The first historian to overcome the defects of both the chronological and categorical arrangements was Yüan Shu (1131-1205), who reorganized the materials of Ssu-ma Kuang's work, mentioned above, under the title of *T'ung chien chi shih pen mo* (Complete history), which was published in 1173. He introduced to China a universal model which was followed in hundreds of privately written histories after his time—bringing the material together not under predetermined categories, but topically and strictly according to the data in hand. The superiority of this form is due to the fact that it made possible an exhibition of the causal relationships between events and the tracing of broad movements in their entirety.

In the seventeenth and eighteenth centuries there was a new emphasis on historical method involving a return to ancient texts, a wide search for evidence and the establishment of hypotheses as the basis of a new originality. This is exhibited in the work of Hu Wei (1633-1714) on the cosmological basis of the Sung philosophy, of Yen Jo-chü (1636-1704) on a forged text of the *Shu ching*, of Ts'ui Shu (1740-1816) on unreliable data in ancient histories and of Chang Hsüeh-ch'eng (1738-1801) in stressing the importance of local histories, archives and hitherto unused government documents.

With the modern cultural renaissance in China came also an increased development of historical research and scholarship. This new movement, inspired chiefly by the work of K'ang Yu-wei and Liang Ch'i-ch'ao, aimed to develop a truly national school of history. These writers broke down the sacred barrier surrounding the most ancient texts as well as the elaborate chronological framework of the older historiography and the traditional concept of an ancient golden age in which a vast unified empire was ruled by benevolent monarchs. The movement today is concerned with the detection and elimination of forgeries, the recovery of lost and neglected works, the clarification of existing texts and wide comparative study, not merely on the basis of literary documents but in the light of a mass of new data derived from the study of archaeology, anthropology, folklore and existing social practises.

The two oldest historical writings in Japan

are the *Kojiki* (Record of ancient matters, tr. by B. H. Chamberlain, Asiatic Society of Japan, *Transactions*, vol. x supplement, 1882) completed in 712, and the *Nihongi* (Chronicles of Japan, tr. by W. G. Aston, Japan Society, *Transactions and Proceedings*, supplement i, vols. i-ii, London 1896) completed in 720. The latter is in the Chinese language, the former in Japanese, transcribed phonetically by means of Chinese characters. Both record ancient poems and legends dealing with national origins and are valuable chiefly for the light they throw on the language, manners and world view of a period before Japanese written history began. The *Nihongi* is in the form of an annal of the Chinese type, but is rather disappointing when judged from the strictly historical point of view. Traditional Japanese chronology is usually said to begin about 600 B.C., but the earliest tombs which can be dated and the first literary references to Japan that are found in Chinese histories do not yield dates earlier than the first century A.D. Accurate chronology, moreover, cannot be said to begin until the seventh century. Other early historical works are the *Sandai-jitsuroku*, imperial annals covering the period from 859 to 887, and the *Idzumo-fudoki*, a historico-topographical account of the province of Idzumo published in 733. Many works of the latter type appeared in succeeding centuries, often under religious auspices. Between the tenth and sixteenth centuries the preoccupation of the learned classes with Buddhism and internal warfare, and the lack of a national consciousness incident to feudalism made the writing of extensive histories difficult if not actually impossible. But there appeared from time to time annals of noble families, many war and court novels of a semihistorical nature, collections of poetry such as the *Manyōshū* (tr. by D. F. Waugh as *Crumpled Leaves from Old Japan*, Amherst 1922) and *Monogatari* (partly tr. by Arthur Waley as *The Tale of Genji*, vols. i-iv, London 1925-28), which are valuable for reconstructing the social history of that time.

At the close of the seventeenth century a strong movement for the cultural emancipation of Japan from Chinese influences set in. With this came also a revived interest in the study of Japanese history and literature. The works of Arai Hakuseki (1657-1725), Kada Atsumamaro (1668-1736), Kamo Mabuchi (1697-1769), Motoōri Norinaga (1730-1801) and Hirata Atsutane (1746-1843) all contributed to the development of a strong national feeling. The first compre-

hensive history of Japan written from this nationalistic point of view was the *Dainihonshi* compiled by numerous scholars under the direction of Mitsukuni, prince of Mito. It appeared in 1715 in 243 volumes but was not actually printed until 1851. Aimed to discredit the shoguns and glorify the power of the mikado, this work has been called "the real author of the movement which culminated in the revolution of 1868."

Since the restoration of 1868 every effort has been made under both government and private auspices to sift all available records and rewrite the history of Japan in a genuinely scientific spirit. Historical societies have been organized, such as the Meiji Shigakukwai with its historical review, *Shigaku zasshi*, and great undertakings inaugurated, like the *Kojiruien*, a veritable encyclopaedia of the customs and institutions of Japan up to the Meiji, begun in 1897, and the *Dainihon shiryo*, a vast compilation of nearly all extant historical sources since 885, begun in 1901.

ARTHUR W. HUMMEL

United States. Historical writing occupies a disproportionately large space in American letters, for it has been assiduously practised during periods when little imaginative literature of high merit has been produced; but it has made fewer contributions to American thought than might be expected. American historians have neither expressed so fully the national mind nor disseminated so many influential ideas as have the British or German historians. Most of the best history was written with an artistic rather than instructional aim, and much of the rest never rose to a level which would allow it to receive an ideological tinge. Nevertheless, it does reflect with some accuracy changes in national temper, cultural equipment and interest. While pure literature was passing through the theological, federalist, romantic and realistic periods of the eighteenth and nineteenth centuries, history showed alterations rising from increased democracy, improved education, bursts of nationalism, lessened interest in European affairs, the growth of scientific method and other factors. Although rigid partitions are misleading, four general phases may be distinguished: first, the primitive historical work of the colonial period, done with an autobiographical or a strictly utilitarian motive; second, the patriotic and filiopietistic writing which followed the revolution; third, the highly "literary" history of the New England

renaissance; and, fourth, the scientific production of the period after 1875, marked also by a notable broadening of the scope of history.

It is easy to understand why little history of permanent importance was written before the revolution and indeed before 1820. The colonies were poor in the social elements—leisure, culture, learned accumulations—which are essential to history. The earlier historical works are either original narratives based in part upon personal observation or local or provincial histories limited generally to political events and useful chiefly as works of reference. Among the former are several books which merit the warmest praise as human documents rather than as pure history. William Bradford's *History of the Plimoth Plantation* (written between 1630 and 1651) and John Winthrop's *History of New England from 1630 to 1649* (published in part in 1790 and complete in 1825-26) are the work of men of education, insight and intellectual grasp. The former especially is a noble corner stone for American historical literature, an earnest, conscientious and vivid record of one of the most memorable adventures in human colonization. Loosely annalistic in structure, it derives unity from its frank expression of the writer's personality.

Winthrop's book is more disjointed, contains more superstition and gossip and lacks the personal charm of Bradford's narrative but has much the same authenticity and freshness. John Smith's *A True Relation . . .* (1608) and his *General Historie of Virginia, New-England, and the Summer Isles* (1624) are likewise half history, half autobiography, of unflagging interest but confused and containing passages of disputable veracity. Of the books of provincial annals the most important are William Hubbard's *A Narrative of the Troubles with the Indians in New England . . . to 1677* (1677); Thomas Prince's *A Chronological History of New England* (1736), the most scholarly work of the colonial era; William Stith's *History of the First Discovery and Settlement of Virginia* (1747); Robert Beverley's *History and Present State of Virginia* (1705); and Cadwallader Colden's *History of the Five Indian Nations* (1727). None of these meets the stricter demands of historical scholarship but all are useful and testify to a real and widespread interest in the past.

The revolution, accompanied by much controversial writing, was naturally followed by a wave of justificatory and panegyric history. David Ramsay's *History of the American Revolu-*

tion (1789), the work of a member of the Continental Congress, is partisan and incomplete; Timothy Pitkin's *Political and Civil History of the United States of America* (1828) is a dryer work with more statistical and documentary material but equally one-sided. Into such books as Jedediah Morse's *Annals of the American Revolution* (1824) there crept absurd traditions and anecdotes, which were even more prominent in many of the filiopietistic biographies of the time. Mason L. Weems' *Life of George Washington* (1800) long exercised a deplorable influence upon popular history. John Marshall brought to his *Life of George Washington* (1804-07), which contains broad historical elements, an eminently judicial temper; but while his revolutionary narrative is fair, his later chapters are indefensibly Federalist in tone. On the royalist side the outstanding work of the period, better as a history than any work already named, was the third volume of Thomas Hutchinson's *History of the Province of Massachusetts Bay, 1740-74* (1828), marked by notable detachment, candor and breadth of view. Meanwhile the stream of local annals was increasing and in such works as Jeremy Belknap's *History of New-Hampshire* (1784-92), Benjamin Trumbull's *Complete History of Connecticut* (1818), John D. Burk's *History of Virginia* (1804-05) and David Ramsay's *History of South-Carolina* (1809) was improving conspicuously in quality.

The classic age of American historiography was ushered in with the second generation after the revolution. By this time the necessary social factors had all appeared: a cultivated public of considerable size, a class of leisured scholars directly acquainted with European thought, accumulations of books and manuscripts and the opportunity of further acquisition, a wide diffusion of literary taste and a desire to celebrate certain broad historical facts. There emerged in New England between 1820 and 1860 one of the best schools of literary historians in the world. Prescott, Motley and Parkman, all educated Bostonians, all Harvard graduates, all men of means, dealt with world forces and events; close beside them stood two other Massachusetts men, Jared Sparks and George Bancroft, who wrote of the American past.

Holding a common preference for panoramic history, Prescott, Motley and Parkman were all indebted to the literary impulse flowing from the British historians Robertson, Roscoe and Gibbon; they all conceived of history as essentially dramatic in form; and they all showed a dis-

tinctly Protestant, not to say Puritanic, tendency. Broadly speaking, the differences in their work are less important than these resemblances. Prescott's most ambitious books, his *History of the Reign of Ferdinand and Isabella the Catholic* (1838) and his *History of the Reign of Philip the Second* (1855-58), were planned to cover two periods in which the splendor and amplitude of the scene would lend his pen the greatest possible aid—one the period in which Spain was unified, the Moors were conquered, America was colonized and the Inquisition was established; the other the period of the Reformation, the rebellion in the Netherlands, the war with France and the Armada. Motley dealt with a lofty table land of European history, from which streams flowed to almost every corner of the continent. His *Rise of the Dutch Republic* (1856) and his *History of the United Netherlands* (1860-68) constituted primarily a history of the great central struggle of Protestantism and Catholicism in Holland, England and Germany and culminated logically in his plan for a history of the Thirty Years' War. Parkman dealt with the clash of two civilizations in the New World and the defeat of Latins and Catholics by Anglo-Saxons and Protestants. In these three writers court and camp, crowded cities and bloody battlefields, exploring expeditions and encounters with Moor and Indian, crowd less thrilling materials from the page. It is true that Prescott gave careful attention to intellectual history, Motley to the minutiae of diplomacy and Parkman to the institutional side of the old regime in Canada; but all three neglected much of the duller but indispensable work of modern history. None of the three showed much interest in ideas; Motley was the most philosophical, but his unrestrained Protestant bias carried him too far and he now appears intolerant and naïve.

While the "literary" history written by these men gained a more enthusiastic following than has since been attained by American historical work and gave the world a dozen volumes still ranked as classics, its weaknesses did not pass unperceived. They were even more clearly manifest in the cultivated, genial but superficial pages of Washington Irving's *Life and Voyages of Christopher Columbus* (1828) and *A Chronicle of the Conquest of Granada* (1829), in which the gifted author declined exhaustive research and sometimes smoothed over problems instead of solving them. Meanwhile from Germany were coming historical ideas very different from those of the British school—principles of a more coldly

scientific and comprehensive inquiry, indifferent if not hostile to the finer literary effects. George Bancroft studied at Göttingen and Berlin from 1818 to 1821, and upon his return to America began publishing translations from Heeren and other German historians. He became acquainted with the historical methods of the whole new generation of German scholars, notably Niebuhr and Ranke. How much he gained from these masters is doubtful. In his original works his style tended to the rhetorical, his preference was for political history and he neglected the economic factors emphasized by Heeren. Yet when he published the first volume of his *History of the United States* (1834) his preface laid emphasis on skepticism, authenticity, reliance upon sources alone and indefatigability of research. Bancroft's principal defects were his lack of detachment, his enthusiastic identification with democracy—"every volume voted for Jackson"—his Corinthian style and his lack of judgment, which gave his pages constant touches of mortality. His own generation thought him the greatest of historians; the next generation left him unread. Yet when he issued his "last revision" in six volumes (1883-85) he had done much not only to open up the whole field of American history but to make it impossible for future scholars to write without a critical and scientific temper. The German principles which he had introduced in part were by that time being reenforced by the work of a dozen seminars organized by scholars who had studied abroad (that started by Herbert Baxter Adams at Johns Hopkins in 1876 is usually considered to have been the first) and were being illustrated by an almost dismayingly numerous corps of monograph writers.

In the decades after the Civil War this growing vigor of the scientific impulse furnished one of the two dominant tendencies of the time; the other tendency came again from England in a demand for histories of "the life of the people." This latter demand, exhibited in the works of Macaulay and John Richard Green, provoked wide enthusiasm and considerable imitation in America. Edward Eggleston about 1880 began studies for a history of life in the United States, finally producing *The Beginners of a Nation* (1896). Henry Cabot Lodge followed in Green's footsteps with his *Short History of the English Colonies in America* (1881), of which the distinctive portion was a thorough study of the life, manners, economy and politics of the colonists of the north and south in 1765. Far more im-

portant was John Bach McMaster's *History of the People of the United States . . . to the Civil War*, of which the first volume appeared in 1883 and the last, bringing the story to 1865, in 1927. Large sections of McMaster's later volumes were formless and undigested; but his work as a whole contains an immense mass of detail, concrete and accurate, upon the past experiences of the plainest Americans—plowmen, shopkeepers, merchants, sailors, pioneers—and in depth of research as well as fulness he often went beyond Green's example. Since 1880 the humble masses have never ceased to play the largest role in histories of America.
